VEGETABLES FOR FRESH MARKET
ESTIMATES BY SEASONAL GROUPS AND STATES
1969-74

ACREAGE, PRODUCTION, AND VALUE

INTRODUCTION

This publication presents the final official estimates of acreage, production, and value of the principal fresh market vegetables, melons, and strawberries by seasonal groups from the major producing States for 1969 through 1974. These estimates cover 85 percent of the national commercial production of all fresh market vegetables and melons.

These estimates continue the series started with Statistical Bulletin No. 126, "Commercial Vegetables for Fresh Market, 1939-50." Subsequent data have been carried in "Vegetables for Fresh Market," Statistical Bulletins No. 212 for 1949-55, No. 300 for 1954-59, No. 412 for 1959-65, and No. 495 for 1964-70.

Fresh market vegetable estimates published for 1918-38 are not comparable with estimates since 1939. The earlier estimates were confined primarily to well-recognized commercial areas for which substantial quantities were shipped to distant terminal markets. Many local market or market garden areas near large population centers were excluded from these estimates.

Estimates are included for acreage, yield, production, price, and value for snap beans, sweet corn, cucumbers, spinach, and tomatoes going for fresh market use. For asparagus, broccoli, carrots, cauliflower, and strawberries, estimates of acreage, yield, production, price, and value cover the total crop while only estimates of production, price, and value are shown separately for fresh market and processing uses.

Estimates of artichokes, brussels sprouts, celery, garlic, onions, and green peppers are made for the total crops, although a small portion of the production is for processing.

The total cabbage crop is estimated by States, but only fresh market production is shown in the summary tables in this publication.

The most active harvesting periods include: winter--January, February, March; spring--April, May, June; summer--July, August, September; and fall--October, November, December. However, the seasonal patterns for harvest may deviate from these periods because of fluctuations in marketing seasons and changes in the weather.

In this publication, the value of vegetables sold for fresh market use is "F.O.B. shipping point," except garlic, for which value per unit is reported annually on a field run basis at the packinghouse door. Vegetables sold for processing are valued at the processing plant door, also referred to as packinghouse door. For vegetables sold both for fresh consumption and processing,

total value is the sum of the value for both uses. Per unit value is derived by dividing total value by total quantity and is not really a "price" nor used for parity purposes.

Except for late summer onions and New York cabbage, production estimates relate to production of value. For these crops, production and sales are different due to shrinkage and loss during storage.

Acres harvested includes all acreage completely or partially harvested including mature acreage abandoned because of low prices, shortage of farm labor, and other economic factors. Planted acreage in this report includes acreage harvested and acreage lost or abandoned due to all causes. Acreage lost but replanted to the same crop early enough to be harvested in the season for which it was originally intended is counted only once. Acreage lost and replanted to the same crop for harvest in a later season is considered to have been planted in both seasonal classifications but is included as harvested acreage in the second season only. Acreage lost and replanted to another crop is included as planted acreage for both crops but as acreage harvested for only the second crop. Estimates of both planted and harvested acreages published for asparagus and strawberries include only bearing acreage and exclude nonbearing acreage planted for harvest in future marketing seasons.

Estimates in this publication are based primarily on data secured from growers and others associated with the production and marketing of vegetables, melons, and strawberries. Information is obtained by mail, field counts and measurements, and interviews. Data on acreage, movement, and sales provided by organizations, associations, and public agencies are also used.

APPENDIX

This table summarizes revised estimates of total U. S. vegetable production for fresh market and processing and also melon production for the years 1969-74. A comparable series beginning with estimates for 1919 is given in Statistical Bulletin No. 212, issued in June 1957; Statistical Bulletin No. 300, issued in December 1961; Statistical Bulletin No. 412, issued in August 1967; and Statistical Bulletin No. 495, issued in October 1972. Data in this current publication supersede estimates in prior annual series.

Estimates of fresh market vegetables and melons, as summarized in this table, include production all major producing States plus production in minor States. As a result, the national total exceeds the production shown in the summary tables.
