SELECTED AGRICULTURAL STATISTICS ON SPAIN, 1965-76. Economics, Statistics, and Cooperatives Service; U.S. Department of Agriculture. Statistical Bulletin No. 630.

ABSTRACT

This statistical compendium reflects the supply and demand for agricultural products in Spain during 1965-76. Topics covered are population, labor force, wages, income, prices, farm structure, crop production, livestock production, food consumption, and selected agricultural inputs.

Keywords: Spain, Population, Economic indicators, Land use, Farm structure, Crop and livestock production, Prices, Farm inputs.

PREFACE

This compendium is the first of three volumes that summarize selected agricultural and related statistics of Spain, Portugal, and Greece. A fourth volume will summarize the agricultural trade of these three countries. These four volumes are being compiled to provide a statistical foundation for indepth studies of the possible effects on U.S. agricultural trade of the entry of Spain, Portugal, and Greece into the European Community.

In preparing the tables, priority was given to reporting data published by the Spanish Government. Other data sources were used according to their availability, reliability, and consistency with official Spanish data. Estimates made by the Economics, Statistics, and Cooperatives Service (ESCS) are identified as such. The data are calendar year unless otherwise indicated.

Data in this compendium were compiled by Stephen Wayne Hiemstra, currently a doctoral student at Michigan State University, with assistance from James Lopes of ESCS. Other ESCS contributors were: Riley Kirby, technical advice and consultation; Elizabeth Hathcock and Deborah Hood, clerical support; Reed E. Friend, and John C. Dunmore.

Selected Agricultural Statistics on Spain, 1965-76

HIGHLIGHTS

Spain's population was 36.2 million in 1977, increasing at an average annual rate of 1 percent between 1965 and 1977. Agricultural population declined to 7.2 million in 1976 (one-fifth of the total population), declining at an average annual rate of 1.1 percent since 1965. The population in the industrial northeast (Nordeste), areas around Madrid (Centro), and the Canary Islands (Canarias) increased 2 percent or more annually, while it declined 2 percent annually in some agricultural areas such as the Extremadura (bordering Portugal). The proportion of the population in older age groupings increased, and females outnumber males, particularly in the older age groupings.

Spain's labor force totaled 13.4 million in 1976; 21 percent were in agriculture (including hunting, fishing, and forestry). The total labor force increased, but employment in agriculture decreased at a compound annual rate of 3 percent between 1965 and 1976. Regions with the highest proportion of agricultural workers relative to nonagricultural workers in 1970 were Extremadura, 50 percent; Galicia (northwestern Spain), 48 percent; and Andalucia Oriental (southeastern Spain), 44 percent.

Spain's gross domestic product (GDP) grew at a real rate of 7.6 percent annually from 1965 through 1975. Services, commerce, manufacturing, and agriculture were the four largest components of GDP in 1975. Agriculture's contribution to GDP continued to increase in absolute terms during 1965-75, but its contribution declined in relative terms. Average GDP per worker in Spain increased more than fourfold in nominal terms.

The general cost of living index in Spain increased 2.7 times between 1965 and 1976, with increases much higher during 1971-76. Food price increases during 1965-76 ran slightly below increases in the general price index.

The value of agricultural production (at factor costs) increased 2.8 times between 1965 and 1976. The net value of agricultural production per farmworker, in combination with the decline in the agricultural labor force, increased fourfold.

Census data collected in 1962 and 1972 show a trend toward larger, less fragmented farms, as the Government sought more rational use of the land. The number of farms declined from 2.8 to 2.5 million, area in farms increased from 44.6 to 45.6 million hectares. Average farm size was 15.7 hectares in 1962 and 17.8 hectares in 1972. The average number of parcels per farm declined from 13.5 to 10.8, and the regional farm size varied sharply from an average of 5.9 hectares in Canarias (islands off the west coast of Africa) to 31.8 hectares in Centro (central Spain) in 1972.

Land tenure patterns changed significantly between 1962 and 1972, but owner-operated land still accounted for nearly three-fourths of the land in farms. Share cropping dropped off sharply, while rented land and other types of arrangements showed a significant increase.

Cultivated area remained relatively stable at about 40 percent of all land between 1965 and 1976. Irrigated area, important because of Spain's arid climate, increased from 10.1 to 12.8 percent of the cultivated area. Field crops, tree crops, and fallow land accounted for 51, 24, and 25 percent, respectively, of total cultivatable area in 1976. Nearly three-fourths of the irrigated land is used for field crops, and less than one-fourth for vineyards and tree crops.

The area in grains remained relatively constant from 1965 to 1976, accounting for about 68 percent of the total harvested area in 1976. Wheat, barley, and corn together consistently accounted for 90 percent of the grain area (7.2 million hectares in 1976), although the relative importance of the three crops varied in response to the changing emphasis of government price support programs. Wheat area varied from 4.3 million hectares in 1965 and 1967 to 2.7 million hectares in 1975, barley area varied from 1.3 to 3.2 million hectares, and corn area varied from 432,000 to 544,000.

Forages, sunflowers, and potatoes were the next three crops of importance in terms of land area. Sunflowers area increased from 11,000 hectares in 1965 to over 500,000 hectares in 1976. Forage area went up to 1.5 million hectares and sugar beet area doubled. The area in potatoes increased slightly while cotton and tobacco plantings declined.

The harvested area in irrigated field crops grew nearly one-fifth between 1965 and 1976. Barley, corn, potatoes, and sugar beets increased in importance, while wheat and cotton decreased. Grains, potatoes, and sugar beets accounted for two-thirds of the harvested area in irrigated field crops in 1976, about the same as a decade earlier.

Crops with increased yields between 1965 and 1976 included wheat, barley, oats, corn, rye, rice, potatoes, sugar beets, tomatoes, lemons, tobacco, and cotton. Increased use of such manufactured inputs as fertilizer, insecticides, and farm machinery contributed to the improvement of yields, as did the increase in area under irrigation. Grapefruit and bitter orange yields remained fairly constant, while sunflower, orange (excluding bitter oranges), and tangerine yields declined. Sunflower yields decreased somewhat because increased planting were almost entirely on arid land. The aging of the tree stock contributed to the poor showing for oranges and tangerines.

Production of most crops increased significantly. Between the 1965-67 period and 1974-76, barley production nearly tripled, oat output rose 30 percent, corn increased by one-half, potato output rose more than a fourth, sugar beet increased nearly three-fourths, sunflower production (from a small base) increased fifteen fold, tomato output rose 80 percent, total citrus production rose more than a fourth (largely in tangerines and lemons), table olives doubled, and olives for oil increased by 16 percent. Policies to cut wheat output resulted in a 13-percent decline, rye output fell nearly a third, cotton production fell more than a third, and tobacco output fell by 10 percent.

Livestock inventories reflected both increases in consumer demand for meat and dairy products and decreases in the use of draft animals. Cattle, hog, and poultry numbers increased substantially between 1965 and 1976, goat numbers remained relatively constant, and sheep and horse numbers declined. Much of the growth in cattle numbers was due to the increase in dairy herds.

Cattle and hogs tend to be located in the northern half of Spain. Heavy sheep concentrations are in central, east central, and north central Spain. Southern and central Spain have the primary concentration of goats. All regions have a substantial number of chickens, but they tend to be concentrated across northern Spain.

Meat production grew at a compounded annual rate of 8.1 percent from 1965 to 1976, with the largest increases occurring for rabbit meat, followed by pork, poultry, beef, and mutton. In 1976, poultry, pork, and beef accounted for 35 percent, 32 percent, and 21 percent, respectively, of total meat production of 2 million metric tons.

Cow's milk production increased nearly 60 percent between 1965 and 1976, while commercial chicken egg production rose 40 percent. Wool production fell by more than a third, as the number of sheep sheared fell from 17 million to nearly 12 million.

Significant changes occurred in average meat carcass yields between 1965 and 1976. Yields were up 45 percent for cattle, 31 percent for rabbits, 18 percent for broilers, and 9 percent for sheep. The average slaughter weight for hogs fell by 16 percent. Average milk yield for dairy cows rose 30 percent to reach 2,861 liters. Confinement feedings, improved breeding, and better management techniques contributed to these changes.

Self-sufficiency levels--the percentage of total domestic utilization locally produced--show that in 1976 Spain was substantially in deficit in production of coarse grains (59 percent), tobacco (39 percent), and cotton (30 percent). Smaller deficits were registered for beef (90 percent) and pork (93 percent). Surpluses existed for citrus (265 percent), rice (124 percent), tomatoes (120 percent), sugar (113 percent), and wheat (112 percent). Cotton and tobacco showed decreasing self-sufficiency levels between 1965 and 1976 while sugar and beef showed increasing self-sufficiency levels. The self-sufficiency ratio for oilseeds and oilseed meal also declined, as imports increased more than fourfold and exports remained practically nil.

Food consumption patterns reflect changes in real income levels, in price relationships, and in tastes and preferences. Between 1965-67 and 1973-75, per capita consumption of meats increased 58 percent, liquid milk and dairy products by over 45 percent, and eggs by over one-third. Decreases occurred in the consumption of rice (18 percent), bread grains and animal fats (14 percent), pulses (10 percent), fresh citrus (10 percent), and olive oil (6 percent). Farm inputs, with the exceptions of farm labor and draft animals, showed an increase in use from 1965 through 1976. Nitrogen fertilizer, for example, increased from an average of 24.7 to 44.2 kilograms per hectare. Similarly, application of phosphorous, potassium, insecticides, fungicides, herbicides, and animal manure increased.

The number of power cultivators increased sixfold, self-propelled combines more than doubled, tractors nearly doubled, and irrigation pumps rose 40 percent between 1965 and 1976 and milking machines more than tripled between 1970 and 1976, as the Spanish converted from animal to mechanical power.

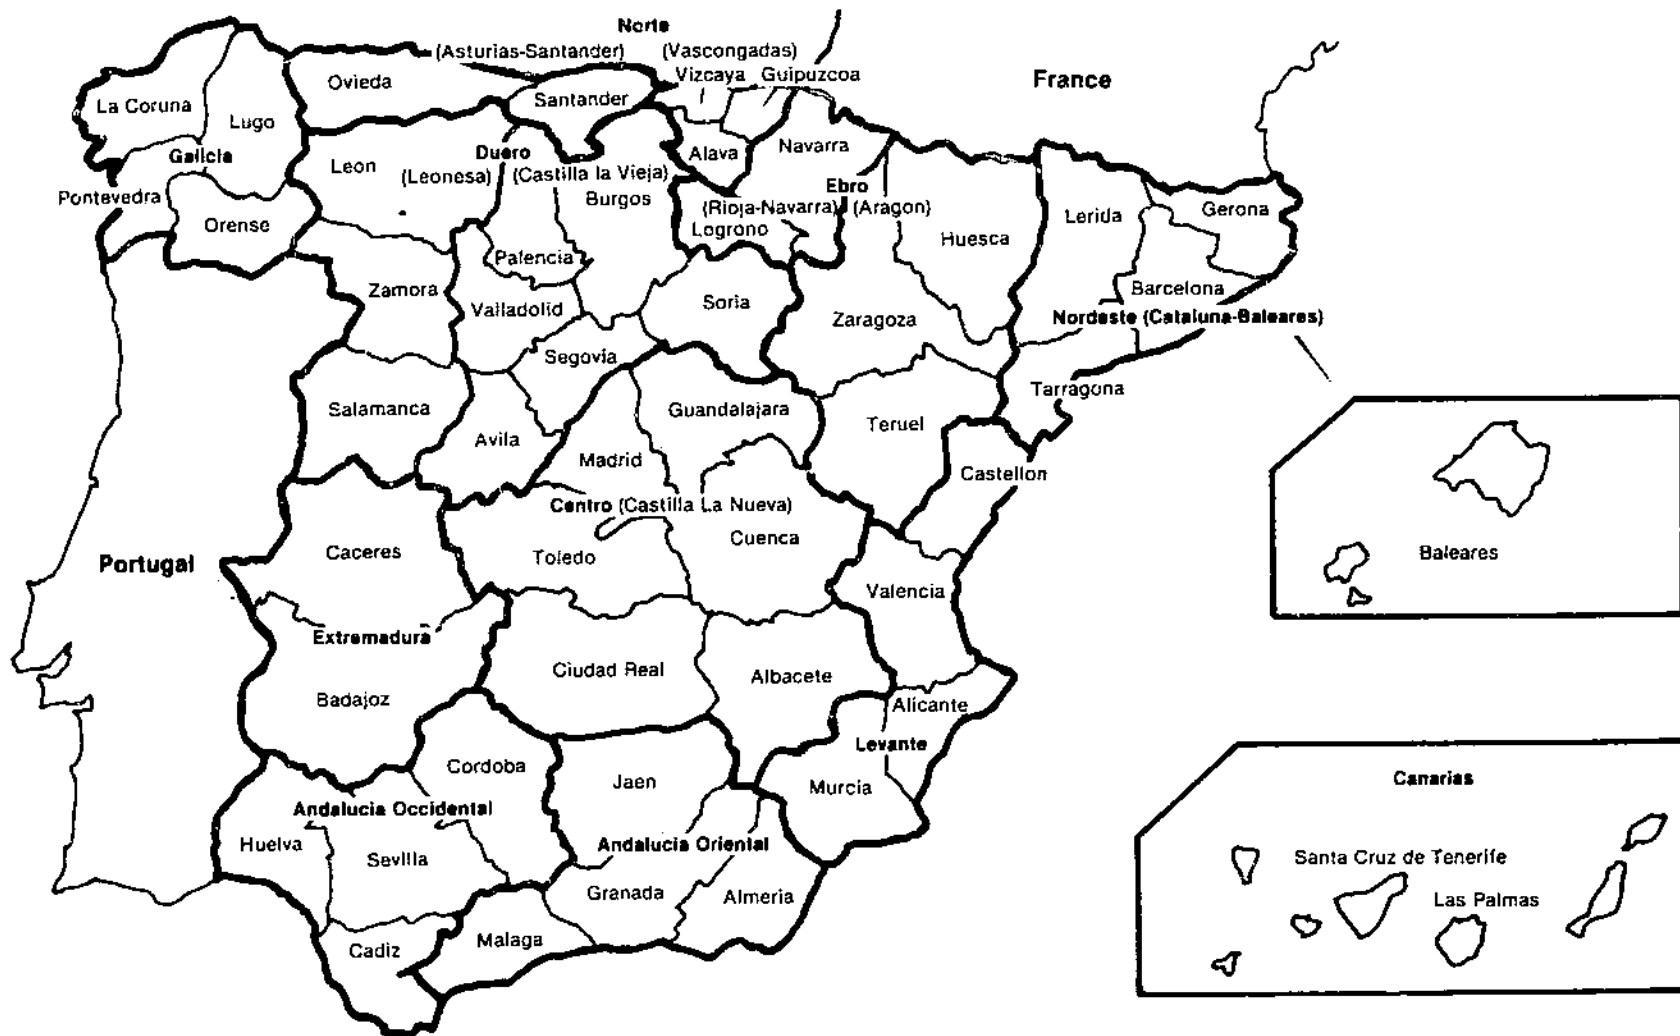

Inflation was the major cause of food price increases from 1965 to 1976. Wholesale prices of food, drink, and tobacco rose at an annual compounded rate of 6.8 percent, with the annual increase at 11.1 percent after 1970.

Farm commodities with the fastest compounded annual rates of price increases between 1965 and 1976 were: Tobacco, 13 percent; goat meat, 11.4 percent; lamb, 10.4 percent; cotton, 9.6 percent; rabbit meat, 8.8 percent; tomatoes, 8.5 percent; veal, 8.2 percent; cow's milk, 7.9 percent; sugar beets, 7.8 percent; potatoes, 7.8 percent; corn, 6.5 percent; rice, 6 percent. Some product prices rose at rates less than 5 percent per year with broiler, egg, and wool prices rising less than 2 percent.

Barley, oat, corn, rye, and rice prices all rose relative to the wheat price during 1965-76, although this trend appears to have been reversed during the latter 2 years. These price changes reflect policy objectives of the Spanish Government. Beef, lamb, goat, and rabbit prices rose relative to pork prices, while broiler prices declined.

Compounded annual rates for farm input prices also rose during 1965-76. Farm wages increased over 14 percent; some seed prices increased nearly 14 percent, some feed prices reached nearly 8 percent, some fertilizer prices rose to over 9 percent, and farm fuel prices increased 7.2 percent.

NA = Not available.

1/ Support prices are for the first month of the marketing year. Prices are increased on a monthly basis to allow for storage, insurance, and interest charges. Marketing years are as follows: wheat, rye, barley, and oats (June-May); sorghum, millet, and corn (September-August 30); rice (September-November).

2/ Quality Amber Durum. See table 132 for breakdown of support prices in recent years. Note that from 1968/69 to 1973/74 the number given is an average of two grades of Amber Durum.

3/ Feed barley, six row grade II.

4/ Average of grade.

5/ Program initiated in 1967/68.
