POULTRY MARKET STATISTICS

1981

Definition of Terms

An Average price is computed by dividing the sum of the midpoints of price ranges reported during the period by the number of price ranges during the period.

A weighted average price is computed by dividing the total value of the sales during the period by the total number of units sold during the period.

An average price for a year is the mean of the 12 monthly averages.

A monthly average price is not computed when a price is not reported for 5 or more consecutive trading days.

A yearly average price is not computed when an average price is not reported for 1 or more months.

Matched plant comparisons are made by comparing information from the same sources reporting in each of two different periods, i.e., current and previous week or current and previous year.

<sup>1</sup> Computed from simple weekly averages weighted by metropolitan area populations.

<sup>2</sup> Based on data from metropolitan New York, Philadelphia, and Pittsburgh areas.

<sup>3</sup> Based on data from metropolitan Chicago and Detroit areas, and major Ohio and Wisconsin cities.

<sup>4</sup> Based on data from metropolitan Atlanta and Jackson areas, and major Louisiana cities.

<sup>5</sup> Based on data from metropolitan San Francisco, Los Angeles, and Houston areas.

<sup>6</sup> San Francisco and Los Angeles are Grade AA.

<sup>7</sup> Not computed because of insufficient price data.

<sup>1</sup> The nine cities are Chicago, Cleveland, Detroit, Los Angeles, New York, Philadelphia, Pittsburgh, St. Louis, and San Francisco.

<sup>2</sup> The nine-city average price is computed by weighting by loads the U.S. Grade A and Plant Grade sales for each of the nine cities indicated and weighting the city averages by their metropolitan area populations.
