WORLD INDICES OF AGRICULTURAL AND FOOD PRODUCTION, 1973-82.  
International Economics Division, Economic Research Service,  
U.S. Department of Agriculture. Statistical Bulletin No. 697.

ABSTRACT

Indices of total and per capita agricultural and food production for 1973-82 are presented for 109 countries and the world. Country indices are calculated by the Laspeyres' base-weighted aggregate formula. Selected production data are given in 1,000 metric tons by country. World agricultural production grew at a compound annual rate of 2.5 percent since 1950, while the rate on a per capita basis was only 0.6 percent.

Keywords: Production indices, per capita indices, agricultural production, Africa, Asia, Oceania, Europe, Western Hemisphere, World

SALES INFORMATION

Additional copies of this report are for sale from:

National Technical Information Service  
Identification Section  
5285 Port Royal Road  
Springfield, VA 22161

Ask for World Indices of Agricultural and Food Production, 1973-82, and indicate whether you want paper copies or microfiche. Cost per paper copy is \$16.00; cost per microfiche copy is \$4.50 (prices subject to change). Enclose check or money order payable to NTIS. Or call (703) 487-4780.

The Economic Research Service has no copies for free distribution.

## FOREWORD

This report is published as a part of the International Economics Division's program of outlook and situation analysis and reporting. The program's regularly scheduled publications include: World Agricultural Situation and Outlook, published quarterly; and regional reports on North America and Oceania, North Africa and the Middle East, China, Eastern Europe, the Soviet Union, Western Europe, Latin America, East Asia, South Asia, Southeast Asia, and Sub-Saharan Africa, published annually.

Data in this publication are those available to the International Economics Division, Economic Research Service, prior to March 31, 1983. This issue includes the People's Republic of China for the first time and revises much of the data and indices previously published in the World Indices of Agricultural and Food Production, Statistical Bulletin No. 689, August 1982.

The Agency for International Development (AID), U.S. Department of State, provides partial funding for the research and preparation of this publication. The results and information reported here are used for congressional reports and data files on countries receiving AID funds for assistance and agricultural development.

Boyd A. Chugg, agricultural economist, coordinated and prepared the publication, with Charles Goode, economist, assisting. Country analysts in the Africa and Middle East, Asia, Eastern Europe and Soviet Union, Western Europe, Latin America, and North America and Oceania Branches of the International Economics Division contributed the production data. Greg J. Acton and Thelma Carpenter of the World Analysis Branch assisted in the preparation. Larry Otto and Phil Rose of the Data Services Center provided programming and other computer assistance.

John C. Dunmore, Chief  
World Analysis Branch

# World Indices of Agricultural and Food Production, 1973-82

## INTRODUCTION

Annual indices of agricultural and food production in foreign countries are prepared as a part of a continuing assessment of the current world agricultural situation. They measure changes in annual and per capita production occurring over time.

Primary commodities produced annually in each country are listed in 1,000 metric tons. The annual aggregated value of production is compared with the annual population by calculating a production index per capita.

## Population

Population data are provided by the Agency for International Development (AID), U.S. Department of State. The numbers are basically those derived by the United Nations demographic division. Adjustments in the United Nations data are sometimes made by AID and the coordinator of this report for consistency and from additional surveys or more recent information. Population numbers approximate midyear estimates.

## Country Indices

Country indices are calculated by Laspeyres' base-weighted aggregate formula. They are constructed from annual production data given in 1,000 metric tons multiplied by a price weight during a base period. The resulting annual sums or aggregates are divided by the values in the base period to calculate an index which represents the change in production.

Caution should be noted in using the aggregates. They are shown in "million dollars at constant prices," and are the annual sums of the quantity (1,000 metric tons) times the price (price weight) during the base period. The sum of those commodities listed in each country represents the current value of agriculture during the base period only. The sums of aggregates for other years are the values based on prices held constant at the 1969-71 average level. By holding prices constant, any change in the aggregate values can be attributed to a change in production. The aggregates do not represent gross sales by producers, or the agricultural component of the gross domestic product, although year-to-year changes in the aggregates or indices may be correlated with similar percentage changes in other such series.

## Base Period Price Weights

The years 1969, 1970, and 1971 were selected as a 3-year average for the base year. During this period relative stability in both agricultural prices and production generally occurred throughout the world.

Price weights used for the base period are generally average annual prices received by producers for each commodity within their respective countries and in their currencies.

Conversion rates, published by the International Monetary Fund, part of the International Bank for Reconstruction and Development (World Bank), were used to convert local currencies to U.S. dollars as a uniform standard weight. However, rates for the Eastern European countries, the Soviet Union, and the People's Republic of China were derived from noncommercial, tourist, and other nonfixed (basic) rates, and more nearly reflect actual free (not official) currency exchange rates, comparable with other free rates of exchange. Producer prices for the base period were obtained primarily from the Food and Agriculture Organization of the United Nations (FAO) with headquarters in Rome, Italy. Some price data were obtained from official reports of the countries concerned.

### Regional Indices

The formula used in computing the indices for the geographic regions and economic groups is a weighted aggregative type, which is the sum of country aggregates in the group or region. World and regional indices are limited to include only those countries listed in this publication.

This method involves a bias favoring countries with relatively comprehensive commodity coverage or relatively high price weights, giving them more weight when aggregating countries into regions, but the bias is normally not significant enough to offset the advantages derived by combining countries into various alternative regions and subregions.

### Feed Deduction

Some farm production such as corn, oilseeds, and other products used for livestock is accounted for in the indices as a grain, oilseed, etc., and also contributes to the production of livestock products. To eliminate this double counting of feed products, a livestock deduction was derived in countries where commercial feeding of livestock products is important. Grazing, pasture, hay, and other similar farm feeding are not accounted for in these indices and, therefore, are not used in calculating the feed deduction.

A fixed percentage deduction for feed was derived by dividing the value of feed for the 1969-71 base period by the gross value of livestock output in the same years. The feed value for the base period was calculated by applying to the grains, oilseeds, and other crops fed the prices received by farmers with no markup for transportation or storage costs.

For byproduct feeds, such as bran or oilcake, average prices paid by farmers were used. The feed deduction is a constant percentage of the annual value of livestock production and, thus, does not express year-to-year variations in feed actually fed.

### Source and Reliability of Data

Official statistics of foreign governments are the primary sources of the production statistics used in this report. U.S. agricultural attaches, FAO, and other international organizations' commodity reports, and estimates made by country analysts in the International Economics Division of the Economic Research Service, USDA, also were

used, especially for the current data. Data in the earlier years of this report for most of the developing countries are not as reliable as those in recent years. Sometimes adjustment in production statistics were made to complete the full series of years for comparability and reasonableness. Statistics on livestock products are generally not as dependable as those on the principal commercial crops.

#### Commodity Coverage

All agricultural production within a country is not accounted for in these indices. However, the major portion of the total and leading products are included and are used to measure the change in the annual production. These selected products seem to fairly represent and reflect each country's historical trends and changes in agriculture. Plantation or commercially grown crops are generally better reported than noncommercial crops. Crop coverage is usually better than that for livestock or fruits and vegetables. Products grown and consumed in home yards are not always included in a country's statistics and are, therefore, not included here.

Hay, pasture, silage, and grazing data are not included because of a lack of comparable worldwide measuring and reporting. Also, no accounting is made in meat production of changes derived from annual inventory numbers or changes in average weight. Meat data are on a carcass-weight basis, excluding offal and trimmed fat, and include both official and unofficial domestic slaughter where reported. Allowances are made in a few countries where a significant value in imports or exports of live animals occurs in a country's annual trade by adding the value of live animals exported to the aggregative value and subtracting the value of live animals imported for slaughter.

#### Food and Per Capita Indices

Index numbers of food production are computed for all countries and regions. They are derived from the same production and price data as the agricultural index and differ only by the exclusion of inedible fiber products, such as rubber, cotton, hemp, kenaf, and wool; and noncaloric products, such as tobacco, coffee, tea, and spices.

The food products listed for each country do not comprise the total food supply grown by the country. Also, some output may be exported and not available for domestic use while other food may be imported and not accounted for in these indices.

Per capita indices are computed by dividing the agricultural or food index by the index of population in the same year.

#### Time Reference

Commodities are combined and shown for the calendar year in which the bulk of the harvest occurred. Where countries report some commodity production on an international marketing year, such as coffee, cocoa, and cotton, the reported production is included in the year shown as the beginning of the marketing or split year.

#### Comparing Data

Some of the statistics on production appearing here may differ from series published by other organizations or countries.

Most countries continually review and revise their statistics and reporting systems. Discrepancies also occur in converting locally used units to metric measures or combining the harvest of two separate crops within a 12-month period. Production data can often be confusing when reported on a marketing, crop, or other split year (1980/81) basis in determining in which calendar year the bulk of the harvest occurred.

Countries that customarily publish indices of the gross value of agricultural production select their own price weights, base years, and methodology. These factors plus differences in defining and measuring meat production, change in livestock inventory and weights, and variations in commodity coverage are major reasons for deviations between the respective country indices and those appearing in this report. However, the percent change from one year to another may not vary greatly between different published indices.
