WORLD INDICES OF AGRICULTURAL AND FOOD PRODUCTION, 1975-84. International Economics Division, Economic Research Service, U.S. Department of Agriculture. Statistical Bulletin No. 730.

ABSTRACT

Indices of total and per capita agricultural and food production for 1955-84 and production data for 1975-84 are presented for 111 countries, 12 regions, and the world. Production and food indices are calculated using Laspeyres' base-weighted aggregate formula. Selected production data are given in 1,000 metric tons by country. World agricultural production grew at a compound annual rate of 2.4 percent since 1955, while the rate on a per capita basis was only 0.5 percent.

Keywords: Production indices, population, per capita indices, agricultural production, food production, Africa, Asia, Oceania, Europe, Western Hemisphere, World.

SALES INFORMATION

Additional copies of this report can be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Ask for World Indices of Agricultural and Food Production 1975-84, SB-730. Write to the above address for price and ordering instructions. For faster service, call the GPO order desk at (202) 783-3238 and charge it to your VISA, MasterCard, or GPO Deposit Account. Bulk discount is available. Foreign customers must add 25 percent extra for postage.

Microfiche copies (\$4.50 each) can be purchased from the Identification Section, National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. Ask for World Indices of Agricultural and Food Production, 1975-84. Enclose check or money order, payable to NTIS. For faster service, call the NTIS order desk at (703) 487-4780 and charge it to your VISA, MasterCard, American Express, or NTIS Deposit Account.

The Economic Research Service has no copies for free mailing.

PREFACE

The base period used in this report is different from the one used in previous issues of World Indices of Agricultural and Food Production. The indices are now based on 1976-78 average price weights instead of the 1969-71 weights used before. Also, the countries of Nepal and Viet Nam are included for the first time. Indexes of agricultural and food production and of per capita production are shown by world, region, and country, beginning in 1955, to provide information on changes and trends in production and output per capita. Production data, by country, in 1,000 metric tons are shown for the past 10 years.

Population estimates for Ethiopia are approximate. Preliminary results of Ethiopia's first national census, conducted in 1983, indicate higher population than currently reported. This would imply lower index levels and growth rates for per capita food and agricultural production than indicated for Ethiopia.

This report is published as a part of the International Economics Division's program of outlook and situation analysis and reporting. The program's regularly scheduled publications include World Agricultural Situation and Outlook, published quarterly; and regional reports on North Africa and the Middle East, China, Eastern Europe, the Soviet Union, Western Europe, Western Hemisphere, East Asia, South Asia, Southeast Asia, and Sub-Saharan Africa, published annually.

Data in this publication are those available to the International Economics Division, Economic Research Service, prior to March 31, 1985. This report updates and revises the data and indices previously published in the World Indices of Agricultural and Food Production, Statistical Bulletin No. 710, July 1984.

The Agency for International Development (AID), U.S. Department of State, provides partial funding for the research and preparation of this publication. The results and information reported here are used for congressional reports and data files on countries receiving AID funds for assistance and agricultural development.

Boyd A. Chugg, agricultural economist, coordinated and prepared the publication, with Charles Goode, economist, assisting. Country analysts in the International Economics Division contributed the production data. M. Sue Daigrepoint typed the text, and Penni Korb designed the microcomputer methods for data entry. Larry Otto and Phil Rose of the Data Services Center provided programming, output, and other computer assistance.

World Indices of Agricultural and Food Production, 1975-84

INTRODUCTION

Annual data on agricultural and food production and production indices in foreign countries are prepared as a part of a continuing assessment of the current world agricultural situation. They measure changes in annual and per capita production and provide a means to aggregate, compare, and measure changes in countries, regions, and world output of food and agriculture.

Primary commodities produced annually in each country are reported in 1,000 metric tons. Annual production is compared with the population by calculating a production index per capita.

Population

Population data are provided by the Agency for International Development (AID). The numbers are basically those derived by the Bureau of the Census. Adjustments in the census data are sometimes made by AID and the coordinator of this report for consistency and on the basis of additional surveys or more recent information. Population numbers approximate midyear estimates.

Country Indices

Country indices are calculated by use of Laspeyres' base-weighted aggregate formula. They are constructed from annual production data given in 1,000 metric tons multiplied by a price weight during a base period. The resulting annual sums or aggregates are divided by the values in the base period to calculate an index which represents the change in production.

Caution should be observed in using the aggregate values. They are shown in million dollars at constant prices, and are the annual sums of the quantity (1,000 metric tons) times the price (price weight) during the base period. The sum of those commodities listed in each country represents the current value of agriculture during the base period. The sums of aggregates for other years are the values based on prices held constant at the 1976-78 average level. By holding prices constant, any change in the aggregate values can be attributed to a change in production. The aggregates do not represent gross sales by producers or the agricultural component of the gross domestic product, although year-to-year changes in the aggregates or indices may be correlated with similar percentage changes in other such series.

Base Period Price Weights

The years 1976, 1977, and 1978 were selected as a 3-year average for the base year. During this period, both agricultural prices and production generally were relatively stable throughout the world.

Price weights used for the base period are generally average annual prices received by producers for each commodity within their respective countries and in their currencies.

Conversion rates, published by the International Monetary Fund, were used to convert local currencies to U.S. dollars as a uniform standard weight. However, rates for the East European countries, the Soviet Union, and People's Republic of China were derived from noncommercial, tourist, and other nonfixed (basic) rates. These rates more nearly reflect actual free (not official) currency exchange rates, comparable with other free rates of exchange. Producer prices for the base period were obtained primarily from the Food and Agriculture Organization of the United Nations (FAO). Some price data were obtained from official reports of the countries concerned.

Regional Indices

The formula used in computing the indices for the geographic regions and economic groups is a weighted aggregative type, which is the sum of country aggregates in the group or region. World and regional indices are limited to include only those countries listed in this publication.

This method involves a bias favoring countries with relatively comprehensive commodity coverage or relatively high price weights, giving them more weight when aggregating countries into regions. The bias is normally not significant enough to offset the advantages derived by combining countries into various alternative regions and subregions.

Feed Deduction

Items such as corn, oilseeds, and other products used for livestock feeding could be included in both the crop production indices and the livestock production indices. To eliminate this double counting of feed products, a livestock deduction was derived in countries where commercial livestock feeding is important. Grazing, pasture, hay, and other similar farm feedings are not accounted for in these indices and, therefore, are not used in calculating the feed deduction.

A fixed percentage deduction for feed was derived by dividing the value of feed for the 1976-78 base period by the gross value of livestock output in the same years. The feed value for the base period was calculated by multiplying the prices received by farmers by the amount of grains, oilseeds, and other crops fed.

For byproduct feeds, such as bran or oilcake, average prices paid by farmers were used. The feed deduction is a constant percentage of the annual value of livestock production, and so it does not express year-to-year variations in feed actually fed.

Source and Reliability of Data

Official statistics of foreign governments are the primary sources of the production statistics used in this report. Commodity reports from U.S. agricultural attachés, FAO, and other international organizations, and estimates made by country analysts

in the International Economics Division also were used, especially for the current data. Data in the earlier years of this report for most of the developing countries are not as reliable as those in recent years. For comparability and reasonableness some adjustments in production statistics were made to complete a full series of years. Statistics on livestock products are generally not as dependable as those on the principal commercial crops.

Commodity Coverage

All agricultural production within a country is not accounted for in this report. However, the major portion of the total and leading products are included and are used to measure the change in annual production. These selected products seem to fairly represent and reflect each country's historical trends and changes in agriculture. Plantation or commercially grown crops are generally better reported than noncommercial crops. Crop coverage is usually better than that for livestock or fruits and vegetables. Products grown and consumed in home yards are not always included in a country's statistics and are, therefore, not included here.

Hay, pasture, silage, and grazing data are not included because of a lack of comparable worldwide measuring and reporting. Also, meat production indices do not account for changes derived from annual inventory numbers or changes in average weights. Meat data are on a carcass-weight basis, excluding offal and trimmed fat, and include both official and unofficial domestic slaughter where reported. In the few countries with significant imports or exports of live animals, allowances in annual trade are made by adding the value of live animals exported to the aggregate value and subtracting the value of live animals imported for slaughter.

Food and Per Capita Indices

Index numbers of food production are computed for all countries and regions. They are derived from the same production and price data as the agricultural index; they differ only by the exclusion of inedible fiber products, such as rubber, cotton, hemp, kenaf, and wool, and noncaloric products, such as tobacco, coffee, tea, and spices.

The food products listed for each country do not account for that country's total production. Also, some output may be exported and not available for domestic use, while other food may be imported and not accounted for in these indices.

Per capita indices are computed by dividing the agricultural or food index by the index of population in the same year.

Time Reference

Commodities are combined and shown for the calendar year in which the bulk of the harvest occurred. Where countries report some commodity production on an international marketing year, such as coffee, cocoa, and cotton, the reported production is included in the year shown as the beginning of the marketing or split year (such as 1980/81).

Comparing Data

Some of the production statistics may differ from series published by other organizations or countries. Most countries continually review and revise their statistics and reporting systems. Discrepancies also occur in converting locally used units to metric measures or combining the harvest of two separate crops within

a 12-month period. Production data can often be confusing when reported on a marketing, crop, or other split year basis in determining in which calendar year the bulk of the harvest occurred.

Countries that customarily publish indices of the gross value of agricultural production select their own price weights, base years, and methodology. These factors, plus differences in defining and measuring meat production, changes in livestock inventory and weights, and variations in commodity coverage, are major reasons for deviations in the respective country indices and those appearing in this report. However, the percentage change from one year to another may not vary greatly from that of different published indices.

Up-to-Date Ag Trade Statistics from the Source

If you need to know about agricultural trade, you need **Foreign Agricultural Trade of the United States (FATUS)**, USDA's bimonthly statistical report on farm exports and imports.

Every other month, FATUS brings you articles and detailed statistics on:

- Ag exports and imports of over 100 commodities
- Price developments in ag trade
- The most current information available on the farm trade situation

In addition, FATUS periodically presents feature articles and statistics on:

- Ag trade with selected countries
- Farm export estimates by State
- Government ag export programs
- Ag trade with the European Community and other regional areas

Every year, you will receive two comprehensive volumes of annual statistics—calendar year and fiscal year—on quantity and value of exports and imports by commodity and country.

If these are the statistics you need, you need FATUS.

Subscriptions may be purchased from:

**Superintendent of Documents
U.S. Government Printing Office

Include your name, address, ZIP code, and a check or money order for **\$21 (\$26.25** for foreign subscribers). Make check or money order payable to Superintendent of Documents. Or charge your subscription to your VISA, MasterCard, or GPO deposit account (include account number and expiration date). For faster service, phone in charge orders to GPO by calling (202) 783-3238.

Other Reports of Interest on International Issues

Agricultural Progress in Ecuador, 1970-82 documents changes and progress made in Ecuadoran agriculture. The petroleum bonanza that transformed Ecuador's economy after 1970 increased demand for foods which had to be filled by imports, most of which came from the United States. The United States was the major market for expanding agricultural exports. FAER-208. November 1984. 52 pp. \$2.25. Order SN: 001-019-00347-2 from GPO.

The British Market for U.S. Food Exports indicates that several U.S. food products are or could be good sellers in the British market: variety meats, edible tree nuts, peanuts, dried vegetables, dried and fresh fruit, selected grain products, and rice. These products are promising despite the problems posed by the European Community's import barriers and by heavy competition from Mediterranean and developing country suppliers. FAER-210. January 1985. 48 pp. \$2.25. Order SN: 001-019-00374-0 from GPO.

Energy's Role in Western Europe's Agriculture discusses energy consumption, prices, and policies in Western Europe. The 1973-80 oil price increases did not significantly alter the structure of the region's agricultural sector or the flow of agricultural exports to the region. FAER-207. November 1984. 36 pp. \$1.75. Order SN: 001-019-0355-3 from GPO.

Financial Constraints to Trade and Growth: The World Crisis and Its Aftermath reveals that debt problems of developing countries will severely limit their ability to purchase goods in the world market for at least the next 5 years. Resolutions of these debt problems could increase potential U.S. agricultural exports by as much as 20 percent. Eighteen countries which are major markets for U.S. agriculture hold more than 60 percent of the problem debt. Both current debts and national economic policies in the developing countries must be restructured to begin the strengthening of those countries' economies. FAER-211. December 1984. 40 pp. \$2.00. Order SN: 001-019-00381-2 from GPO.

Foreign Exchange Constraints to Trade and Development finds that many developing countries, facing huge trade deficits and shortages of foreign exchange, reduced their agricultural imports over the last few years from the United States and others. Unless cash-short countries increase their exports and obtain food and financial aid, their agricultural imports will grow much more slowly in the next decade than in the last. FAER-209. November 1984. 60 pp. \$2.25. Order SN: 001-019-00340-5 from GPO.

A New Method to Assess Effects of Food Supply Shocks on Consumption in Developing Countries, demonstrates use of an analytical procedure for addressing policy issues associated with shortrun shocks of food supplies in developing countries. The procedure can predict how shortrun food supply shocks will affect food consumption among different consumer groups. Can be used by food aid donor countries and agencies to develop food aid assistance programs. TB-1697. January 1985. 56 pp. \$2.00. Order SN: 001-019-00364-2 from GPO.
