Food Spending in American Household, 1980-86. By David M. Smallwood. Cosnmodity Economics Division, Economic Research Service, U.S. Department of Agricultire. Statisical Bulletin No. 791.

#### Abstract

Averdge weekly food expenditures in urban households rose from $\$ 18.84$ per person in 1980 to $\$ 23.92$ in 1986. Weekly spending per person for food consumed at home increased from $\$ 12.82$ to $\$ 14.90$, and from $\$ 6.11$ to $\$ 9.03$ for food consumed away from bome. This bulletin presents information on trends in household food expenditures for major food groups by selected demographic factors for 1980-86. Information is also presented on food price trends. Detailed tabulations are presented for 133 food categories by 10 housebold presented for the years 1980-86. 1985 and 1986. Several measures of food item expenditures and prices are Surveys prepared by the Bureau of Labor Statistics U.S. Departmentinuing Consumer Expendiure Diary of Labor Statistics, U.S. Department of Labor.

# Food Spending in American Households, 1980-86 

David M. Smallwood*

## Introduction

This bulletin updates Food Spending in American Households, 1982-84 (SB-753), published in 1987, and Food Spending in American Households, 1980-81 (SB-731), published in 1985. These reports are similar in design and content and, taken together, provide a continuous series of information on food expenditures from 1980 to 1986. Weekly per person food expenditures of urban households tabulated by selected socioeconomic and dernographic characteristics are reported for 1985 and 1986. Additional tabulations summarize selected food item expenditures and prices over the 1980-86 period. A new table compares food item expenditures in urban and rural households for 1984-86.

Using the per person food spending information in this report, one can detemine the similarities and disparities it spending habits of households of differing sizes, races, incomes, geographic areas, and other socioeconomic and demographic features. This information is valuable for assessing existing market conditions, product distribution pattems, consumer buying habits, and consumer living conditions. Combined with demographic and income projections, this information may be used to anticipate consumption uends. The information may also be used to develop typical market baskets of foods for special population groups, such as the elderly. These maritet baskets may, in tum, be used to develop price indices tailored to the consumption pattems of these population groups.
These tabulations are based on data from the Continuing Consumer Expenditure Survey (CCES) conducted by the Bureau of Labor Statistics (BLS), U.S. Deparment of Labor. Our tabulations provide more food item detail than is available in BLS publications or news releases. The CCES contains the most recent and comprehensive data available on food spending trends by Americans.

Some 13 new tables have been added to this repont to provide annual information on weekly per person food experditure levels, food expenditure indices, and quantity indices for 1980-86. Many of the new tables combine the CCES food expenditure data with food price information from the BLS food item price indices

[^0]for detaited food categories. The quantity indices are constructed by adjusting indices of food expendibure for price changes in the particular food category. Several small food item categories from the CCES are combined in these new tables to make them compatible with the available price data. The full set of tables on expenditure, price, and quantity indices provides a more complete and updated picture of changes in household food consumption behavior during 1980-86.

## Highlights

Average weekly expenditures on food in urban households rose 26 percent from $\$ 18.94$ per person in 1980 to $\$ 23.92$ in 1986. Weekly per person spending for food consumed at home increased 16 percent from $\$ 12.82$ to $\$ 14.90$, compared with an increase of nearly 48 percent for food consumed away from home, which rose from $\$ 6.11$ to $\$ 9.03$. During this period, prices for total food rose 25.6 percent, prices for food at home rose 21.4 percent, and prices for food consumed away from home rose 34.9 percent.

## Other highlights:

- Household size-One-person households spent more than twice as much per person on food as households of six or more persons. They also spent a much larger share of their food budget on food consumed away from home: 51 percent versus 23 percent. Married couples without children spent about the same per person as single persons, while single mothers with children spent about half as much.
- Household location-Food spending varied with the city size and geographic location of residence. Households in urban areas tended to spend more on food thein households in rural areas. In 1986, urban households spent an average of $\$ 23.92$ per person per week on food, of which $\$ 14.90$ was for food at home and $\$ 9.03$ was for food away from home. Rural houseiolds spent a weekiy average of only $\$ 20.04$ per person for food, of which $\$ 14.13$ was for food at hone, compuied with $\$ 5.91$ for food away from home. Rural households spent a smaller share of their food budget on food consumed away from home.

Urban houscholds in the Northeast spent about 12 percent more per person than the national average. Houscholds in the Midwest and South spent the least.

- Income--Average per person food spending increased with household income. In 1986, households in the lowest 20 percent of the income distribution spent $\$ 18.88$ per person per week on food, compared with $\$ 31.28$ for the wealthiest 20 percent. Wealthier households tended to spend more for both food at home and food away from home but also tended to spend a larger share of their food budget on food consumed away from home. The share of the food budget spent on food consumed away from home varied from 29 percent for the poorest group to 43 percent for the wealthiest.
- Race--In both 1985 and 1986, blacks spent about 35 percent less than whites on food. In 1986, average weokly food spending in white households was $\$ 25.10$ per person, compared with $\$ 16.28$ for black households. Food spending in households of other races averaged $\$ 22.87$ per person. White households spent a larger share on food consumed away from home than did blacks. Both whites and blacks spent about the same amount on meas, poultry, fish, and eggs.
- Age--Per person food spending increased with the age of the household head up to age 64 and then declined. However, per person spending on food consumed away from home was highest for households headed by persons under 25 years. Changes in age and household composition caused spending to shift sharply from away-from-home food to at-home food for the next older age group, that is household heads 25-34 years old.
- Season--Seasonal purchases varied more per person for ilems with seasonal production patterns, such as fresh fruits, and for products consumed heavily during holidays, such as "other poultry" (includes turkey), bakery products, candy, and alcoholic beverages. As expected, ice cream expenditures were heaviest during the summer.

## Continuing Consumer Expenditure Survey ${ }^{1}$

The CCES evolved from consumer expenditure surveys of American households that BLS has been conducting periodically at about 10 -year intervals since 1888. A major objective of the first consumer expenditure surveys was to collect information necessary to construct the old Cost-of-Living Indexes and the current Consumer Price Indexes. However, with the rapidly changing economic conditions of the seventies, BLS found that the decennial surveys are inadequate. BLS initiated a continuing survey of consumer expenditures

[^1]in late 1979 and expanded the objectives to include a continuous flow of information on the buying habits of Americans not only for use in revising the Consumer Price Index but also for use in a variety of research by government, business, labor, and academic analysts.

The CCES comprises two components, each with its own questionnaire and sample: (1) an interview panel survey in which each of approximately 5,000 households is surveyed every 3 months over a 1 -year perios, and (2) a diary survey of approximately the same sample size in which households keep an expenditure diary for two consecutive 1 -week periods. The survey treats consumer units rather than households. However, unless it is clearly specified otherwise, the two terms are used synonymousiy in this report. See the "Definitions" section for a detailed explanation of the differences.

The interview panel survey obtains data on large and infrequent expervilitures, such as for real property, automobiles, and major appliances, and those which occur on a regular basis, such as rent, utilities, and insurance premiums. Personal expenditures, including those for food on trips, are also included. Respondents can typically recall these expenditures over a 3 -month period.

The diary survey obtains data on sniall, frequently purchased items that are normally difficult to recall, including food and beverages, tobacco, housekeeping supplies, nonprescription drugs, personal care products and services, fuels, and utilities. This diary survey excludes expenditures incurred while respondents are away from home overnight or longer.

Several features of the $1980-86$ surveys differed from the surveys BLS conducted for 1960-61 and 1972-73. First, only the urban population has been continuously represented in the CCES because rural sampling units were dropped from the sample in 1981, due to budget limitations, but reinstated in 1984. To maintain comparability across all 7 survey years, only the urban portions of the striveys are used for most tables contained in this report. However, as mentioned above, one new table contains a comparison of expenditures of urban and nural households for 1984-86. Second, the new sample size was approximately half that of the previous two surveys, so the estimates were subject to greater sampling error. Third, the collection of information on expenditures of college students changed. In the CCES, students living in college or university housing were sampled directly, while in the 1972-73 CES, this group's expenditures were reported by their parents or guardians. Last, the new survey defined the "head" of a consumer unit using the term "householder" or "reference person," who was the first member of the household mentioned by the respondent as an owner (or renter) of the premises at the time of the initial interview. In previous surveys, husbands were automatically considered to be the heads of consumer units in which both a husband and a wife were present.

This report is based on Economic Research Service tabulations of data collected in the diary component of the BLS surveys as reported in public-use data tapes available from BLS and information previously published in USDA Statistical Builetins 731 and 753.

## Definitions

The following terms, some of which occur frequently in the accompanying tables, are briefly defined.

## Expenditure, Price, and Quantity Indices

Expenditure index--The index of weekly per person expenditures measures the level of actual expenditures relative to the base period, 1980. The expenditure index for the base period is always 100 percent by definition. For example, given 1980 total food expenditures of $\$ 18.94$ and 1986 expenditures of $\$ 23.92$, the 1986 index of expenditures is 126.3 percent (23.92/18.94* $100=126.3$ ). This means that total food expenditures in 1986 were 126.3 percent of the 1980 level or 26.3 percent higher.

Price index-Price indices measure price levels for a food item category relative to the base period, 1980. Price indices in this report are based on published BLS consumer food item price indices adjusted to $1980=$ 100.

Quantity index-Quantity indices measure levels of the food consumption relative to the base period, 1980. They are constructed by adjusting the expenditure indices for price changes. For example, given a total food expenditure index of 126.3 in 1986 and a total food price index in 1986 of 125.6 , the total food quantity index in 1986 is 100.6 (126.3/125.6 * $100=$ 100.6). This means that the quantity of food consumption increased 0.6 percent from 1980.

## Population

Population--The U.S. civilian noniastitutional urban population, as well as that portion of the institutional population living in the following group quarters: boarding houses, housing facilities for students and workers, staff units in hospitals and homes for the aged, infirm, or needy, permanent living quarters in hotels and motels, and mobile home parks.

Metropolitan Statistical Area (MSA)-Except in New England, an MSA is a county or group of contiguous counties that contains at least one city of 50,000 inhabitants or more or "twin cities" with a combined population of at least 50,000 . In addition to a county or counties containing such a city or cities, contiguous counties are included in an MSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, MSA's consist of towns or cities, rather than counties.

Urban population--All persons living in MSA's and in urbanized areas and urban places of 2,500 or more persons outside of MSA's. The term "other urban" is used in this report to describe the urban population living outside of MSA's.

Student population--Students living in college or university housing, usually dormitories.

Primary sampling unit (PSU)-Usually a county or group of contiguous counties, except in certain areas of the Northeast where a PSU is a cluster of towns. A PSU may include both uban and rural areas as well as farm and nonfarm areas.

Geographic regions--Data are presented for four major regions: Northeast, Midwest, South, and West Consumer units are classified by these regions according to the address at which the household was residing during the time of their participation in the diary survey. These regions comprise the following States:

Northeast-Connecticut, Maine, Nassachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest--Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South-Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West--Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

In the 1980-81 CCES, the Midwest was termed the North Central region. Both names represent the same region and include the same States.

## Consumer Unit (Household)

Consumer unit-A consumer unit, the basic reporting unit for the diary survey, comprises (1) all members of a particular household who are related by blood, marriage, adoption, or other legal arrangement, such as a foster child; (2) a financially independent person living alone or sharing a household with others, living as a roomer in a private home or lodging house, or living in permanent quarters in a hotel or motel; or (3) two or more persons living together who pool their income to make joint expenditure decisions.

Financial independence is determined by three major expense categories: housing, food, and other living expenses. To be considered financially independent, the respondent must provide at least two of the three major expense categories.

Householder--The first household member mentioned by the respondent when instructed to "Start with the name of the person, or one of the persens, who owns or rents the home." The relationship of other consumer unit members is determined with respect to this person.

Size of household-The number of persons who normally make up the consumer unit at the sample address.

Age of householder--The actual age of the householder at the time the diary is placed in the household.

Number of earners-All consumer unit members, 14 years and older, who report having worked at least 1 week during the 12 months prior to the interview date, are classified as eamers. This measure will tend to overstate the number of eamers employed on a regular basis.

Number of vehicles-The number of automobiles, trucks, and other vehicles owned by all members of the unit, including vehicles used partially for business but excluding these used entirely for business.

## Income

Total income-The combined income earned by all consumer unit members 14 years old or over in the 12 -month period prior to the last day of participation in the survey. The components of income are wages and salaries, net business and farm income, Social security and other pension income, interest, dividends and other asset income, and other income. Other income includes (1) Supplemental Security Income paid by Federal, State, and local welfare agencies to low-income persons who are 65 years or older, blind, or disabled; (2) income from unemployment compensation; (3) income from workers' compensation and veserans' payments, including education benefits but excluding military retirement; (4) public assistance or welfare, including money received from job training grants; ( 5 ) alimony and child support as well as any regular contributions from persons outside the consumer unit; (6) money income from care of foster children, cash scholarships, fellowships, or stipends not based on working; and (7) the value of food stamps.

Complete income reporting--The distinction between complete and incomplete income reporting is based on whether the respondent provides information on major sources of income, such as wages and salaries, selfemployment, and Social Security income. ${ }^{2}$ Even

[^2]complete income reporters may not provide a full accounting of all income from all sources. Income tabulations in this publication are based only on consumer units with complete income data.

Top coding of income -Individual components of consumer unit annual income that exceeded $\$ 75,000$ in the 1982 survey and $\$ 100,000$ in the 1983-86 surveys are coded in the public-use data tapes as $\$ 75,000$ and $\$ 100,000$ to satisfy Federal regulations set up to protect the identity and privacy of survey participants. Top coding of income leads to a downward bias in the estimate of average income.

Quintiles of income before taxes-Fach quarter, respondents that provide income reports are ranked in ascending order according to the level of total before-tax income reported by the consumer unit. The ranking is divided into five equal groups called income quintiles, and the data for each of the four quarters are then combined. Consumer units providing incomplete income reports are not ranked and are shown separately in all income tables.

## Expenditure Estimates

Expenditures are the transaction costs, including excise and sales taxes, of goods and services acquired during the recordkeeping period. The respondent records the full cost of each purchase even though full payment may not have been made on the date of purchase. The expenditure estimates exclude purchases made while away from home overnight, purchases directly assignable to business use, and periodic credit or installment payments on goods or services already acquired.

Major food and beverage expenditure categories and subgroups that appear in this report are displayed in tables 10-35.

Several factors should be considered when relating individual household circumstances (such as region of residence and race of householder) to the expenditures shown in the tables. First, the expenditures are averages for all urban households with the specific characteristics, regardless of whetuer or not a particular household purchased the specific food item during the recordkeeping period. The average expenditure may be considerably below the expenditure by households that purchased the item. The less frequently an item is purchased, the greater the difference between the average for all households and the average for those households that purchased the item. Even if such purchases were made, an individual household may have spent more or less than the average. Even within groups with similar characteristics, the distribution of expenditures varies greatly. Also, many factors such as income, age of household members, and geographic location of residence influence expenditures and are not held constant within any given table.

The share of total expenditures of an item shown in the accompanying tables for a particular population segment can be readily calculated. The following procedures are employed, for example, to estimate the share of national total food expenditures accounted for by two-member houscholds in 1985. First, multiply the average total per person food expenditures for two-member households ( $\$ 30.01$, from table 16) times the number of two-person households in the United States ( 22,860 , from table 16) times the average number of persons in the households (2, from table 16). Then, divide this result by the product of the average United States household size ( 2.53 , from table 16 ) times the total number of households in the United States $(76,116$, from table 16) times the average total per person food expinditures ( $\$ 24.24$, from table 16). The result of these operations is the share of national food expenditures accounted for by two-member households. Mathematically, the share of national food expenditures accounted for by two-person households equals

$$
\frac{\$ 30.01 \times 22,860 \times 2}{\$ 24.24 \times 76,116 \times 2.53}=29.4 \text { percent. }
$$

We can use similar procedures to estimate the share of the total population accounted for by two-member households. The share of total population composed of two-member households equals

$$
\frac{22,860 \times 2}{76,116 \times 2.53}=23.7 \text { percent. }
$$

Thus, two-member households are 23.7 percent of the population, but turir share of national food expenditures is 29.4 percent.

## Survey Procedures

This section discusses the technical details concerning the CCES sample design, geographic coverage, sampling frame, level of participation, sample weighting factors, data collection, and data processing.

## Sample Design

Data for the CCES were obtained from a nationwide probability sample of households designed to represent the total civilian noninstitutional urban population. The sample consisted primarily of persons living in regular housing units and some selected group quarters such as college domitories.

## Geographic Coverage

A sample of geographic areas called primary sampling units was selected for the survey. The set of sample PSU's consisted of 109 geographic areas, 91 of which were urban areas that were previously defined and selected for the BLS Consumer Price Index and 18 PSU's to represent the rural population. BLS followed a controlled selection procedure to ensure proper
geographic distribution of the selected PSU's. The nural portion of the sample was dropped in 1981 for budgetary reasons but reinstated in 1984.

## Sampling Frame

The sampling frame for the surveys was developed from the Bureau of the Census' 100 -percent-detail files of the population augmented by new construction permits and techniques used to eliminate recognized deficiencies in coverage in that census. The frames for the 1980-85 surveys were based on the 1970 census, while the 1986 survey frame was based on the 1980 census. The revision in 1986 improved the sample frame but created some difficulty in comparing population estimates in 1986 with estimates from the previous years. For example, during 1980-85, the estimated number of consumer units increased steadily. However, the estimated number declined in 1986. The result suggests that caution should be used in comparing population totals between sampling frames. However, the 1986 sampling frame revision will have litule effect on population averages such as food expenditures or income.

Housing units designated for interview were distributed evenly throughout the year, except for the last 6 weeks of the year, when the sample was augmented to account for substantially increased buying activity during the holiday season.

## Level of Participation

Not all consumer units scheduled for selection in each year of the diary survey actually participated. Some units were found to be vacant, nonexistent, or ineligible for the period and thus were not surveyed. Of the remaining units, some were not contacted by the interviewer, some refused to participate, and some were temporarily absent for reasons such as vacations. Sample units with occupants temporarily absent were included in the final sample. These consumer units, along with those from whom data were collected, made up the eligible sample in each survey year. In 1985 and 1986, the response rates were approximately 91 percent and 84 percent of the eligible sample, respectuvely.

## Welghting

Weights were assigned to each consumer unit participating in the survey in order to provide estimates for the U.S. popalation. These weights were a product of several factors: the probability of selecting the housing unit; a December seasonal factor; a factor to adjust for subsampling in the field; a noninterview adjustment; a national ratio-estimate adjustment for 12 age, 2 sex, and 2 race categories for a total of 48 age-sex-race control groups; and a final adjustment based upon consumer unit composition. The weighting process was performed each month on diaries beginning within the month, and each week's interview was
weighted separately. An improved weighting method, generalized least squares (GLS). was initiated in the 1984 survey to narrow the difference between the consumer unit counts in the Diary and Interview surveys.

## Data Collection

The Bureau of the Census collected the data for BLS. At the beginning of the 2 -week collection period, the Census interviewer used the household characteristics questionnaire to record information on the age, sex, race, marital status, education, and family relationships of members of the sample unit At this time, the interviewer also left the diary questionnaire, or daily expense record, with the consumer unit. The diary questionnaire, designed as a self-reporting, product-oriented diary, was used by respondents to record all expenses incurred during participation in the survey. The questionnaire was divided by day of purchase and by broad categories of goods and services.

At the end of the first week, the interviewer picked up the diary, reviewed the entries, clarified any questions, and left a second diary. At the end of the next week, the interviewer picked up the second diary and reviewed the entries. At the same time, the interviewer again used the household characteristics questionnaire to collect previous-year information on the work experience, occupation, industry, retirement status, earnings from wages and salaries, net income from business or profession, net income from one's own farm, and income from other sources. This information was collected, along with the other household characteristics data, to permit (1) classification of families for analysis, (2) determination of eligibility of the family for inclusion in the population covered by the Consumer Price Index, and (3) adjusment for the lack of response by families who did not cooperate in the survey.

## Data Processing

The Bureau of the Census performed a preliminary set of clerical processing activities, including a number of critical data edits and adjustments. During a field edit, data in the diaries were reviewed for completeness and consistency. All notes were reviewed so that expenditure data could be transcribed to the questionnaire for keypunching. Item codes were assigned to the reported expenditure items, household and consumer unit codes were assigned to each family member, and industry and occupation codes were entered for each working family member. At the completion of the clerical processing activities, the data were keypunched and loaded onto computer tapes.

The data were then processed by computer to calculate population weights based on BLS specifications, to impute demographic characteristics for missing or inconsistent demographic data, to impute values for weeks worked when a nonresponse was encountered, and to apply appropriate sales taxes to the expenditure
items. Finally, a computer file cuntaining these data was produced and transmitted to BLS on a monthly basis.

As the monthly diary data tapes were received, BLS created a quarterly data base that was screened for invalid coding, inconsistent relationships, and extreme values that may have been recorded or keypunched erroneously. Coding and extreme-value enors were corrected before BLS processed the tapes further.

BLS subjected selected portions of the diary data to automated imputation and allocation routines when respondents reported insufficient detail to meet publication requirements. The imputation routines assigned qualifying information to data items when an invalid nonresponse was evident. Allocation routines were also performed to transform reports of nonspecific items into specific ones. For example, when respondents reponted expenditures for meat rather than beef or poris, allocations were made using proportions derived from item-specific reports in other completed diaries.

Finally, BLS processed income data through a routine that identified and coded the data as either complete or incomplete. This distinction was based on a welldefined set of rules for reporting the types of income received by individual members and the consumer unit as a whole. Even though incomplete reporting was identified, income was not imputed; however, BLS is considering imputing income.

## CCES and Other Data Sources

The U.S. Deparment of Agriculture (USDA) conducts comprehensive household surveys of food consumption approximately every 10 years. The most recent is the 1977-78 Nationwide Food Consumption Survey (NFCS), which differs in several respects from the CCES. ${ }^{3}$ The most notable difference, other than the survey years, is that the NFCS measures food consumption during the survey period, while the CCES measures purchases. Differences may thus occur due to the value of nonpurchased foods, such as homegrown food and food received as a gift or as pay. These items are included in the NFCS but not in the CCES. Differences also arise because of the timing of consumption versus purchases and changes in household food inventories. However, the disparities among households due to inventory changes tend to average out when tabulations cover large groups of consumers.

Another difference between the two surveys is the unit of observation. USDA uses the household as the observational unit, whereas BLS uses the consumer unit. Although these definitions are similar, differences between units classified by living arrangements and

[^3]economic consuming units will exist, as in the instance of unrelated, economically independent individuals living together.

Population coverage also differs between the two surveys because the NFCS excludes individuals in group dwellings, such as college students living in domitories, whereas the CCES includes them.

Many USDA tabulations of the NFCS data include only housekeeping households in which at least one member consumed 10 or more meals from home food supplies during the 7 -day survey period. Because housekeeping households consume more home food supplies than do nonhousekeeping households, food expenditure estimates based solely on housekeeping households tend to overestimate at-home consumption and underestimate away-from-home consumption, Survey estimates suggest that about 6 percent of the civilian noninstitutional population covered by the NFCS are nonhousekeeping households.

The NFCS data also include food purchased at restaurants, carryouts, and similar types of establishments and carried home for consumption in at-home food expenditures. In the CCES, these types of expenditures are included in away-from-home food spending.

An obvious difference between the NFCS and CCES is the time periods covered by the surveys, 1977-78 versus 1980-86. Differences in economic conditions, such as prices, product availability, and consumer purchasing power, will contribute to observed differences in the reported data.

The personal consumption expenditures (PCE) data are a component of the gross national product accounts, prepared quarterly by the U.S. Department of Commerce and published in Survey of Current Business. The PCE series measures personal expenditures on a national level for all newly produced goods and services.

These estimates àre based on business and govemment sources rather than household interviews. The source and derivation of the PCE estimates thus hardly resemble the CCES estimates. The PCE estimates are also based on the total population, while the CCES estimates are based only on the urban component.

Benchmark estimates for the PCE series are developed approximately every 5 years based on the flow of goods and services through the economy. Personal consumption expenditures for food, for example, are derived by adding transportation costs and wholesale and retail trade markups to manufacturers' prices. Additional adjustments are made for exports, imports, and changes in inventories. Between benchmark years, the various components of the PCE series are updated using survey information on sales of eating and drinking establishments and estimates of growry store sales.

Other minor adjustments are also made. The primary data are from the Censuses of Manufactures, Transportation, and Business.

When placed on an annual per capita expenditure basis, estimates from the CCES are consistently less than those reported in each of the following PCE food components: total food, food consumed at home, and food consumed away from home. The relative difference is greater for food consumed away from home than for food consumed at home, probably because the diary component of the CCES does not include expenditures on food when the respondent is away from home overnight or longer. Disparities between the estimates for expenditures on alcoholic beverages are even larger, but this result is expected because full disclosure of alcoholic beverage consumption is extremely difficult to obtain in household surveys.

The PCE and CCES estimates of per capita annual income also differ, with the CCES income estimates being lower. This difference is consistent with the notion that income is generaliy underreported in household surveys.

A detailed description of the derivation of the PCE series is available in Development of National Income Measures, Supplement to Survey of Current Business (U.S. Department of Commerce, Bureau of Economic Analysis, 1954). A detailed comparison with the CCES data is reported in BLS Bulletin 2245.

## Data Limitations

Data in this report are based on a sample of consumer units and may differ somewhat from the figures that would be obtained if a complete census of consumer units had been taken. The variability of sample estimates is a function of sample design and sample size and generally decreases with larger size samples and aggregation over product categories. Expenditure estimates for broader expenditure groups and larger population groups will generally be subject to smaller sampling variation than expenditure estimates for narrower expenditure and population subgroups. The coefficient of variation (CV), expressing the standard deviation as a percentage of the sample estimate, is a commonly used measure for comparing the relative variability of sample estimates. CV's for the various detailed estimates of weekly per person food expenditures presented in this report for the total urban population are given in table 35 .

The estimates are also subject to sampling biases that may result from the selection of households, the recording of information, and the interpretation of information. The long and extensive experience of BLS in conducting surveys of this type, however, helps to minimize these sampling biases.

Identifying and handiling incomplete questionnaires introduce another potential source of bias. In the CCES diary, identifying incomplete expenditure reporting is particularly difficult because respondents are required to report only items actually purchased. No action is required on items not purchased during the survey. Distinguishing between an incomplete expenditure diary and one in which the respondent records only a few purchases is difficult Incomplete reporting on other sections of the survey may be associated with
incomplete expenditure diaries. For example, homeowners not reporting a mortgage status are about half as likely to report purchases for most food items as those homeowners reporting a mortgage status. A similar pattern, but not nearly as pronounced, is observed for consumer units with incomplete income reporting. Because of these reporting phenomena, we advise caution in any further use of the tabulations in this report for these two subgroups of consumer units.

7able 21--Setson, 1986: averige weokly per person food expenditures of urban households

Item | all |
| :---: |

Houtohold eharacteristics:

```
Households (thousands)
Sample diaries (numbar)
    Aye of houroholciar (years)
    income bofore taxus (doliars)
        Incom after taxes (percent)
        Vage and salary income (Dercent)
    Mrobers per household (rumber)
        Children under }18\mathrm{ years (muber)
        Aduits over 64 yours (rumber)
    yehlcles per nousenoid (number)
    Earners par housenold (number)
    tweownershtp (percent)
```

avarage weakly per person food expenditure:
food, sotal (excluding alcoholic beverages)
Food at home
Careal and bakery products
Cereal and ceral products
flour
Prapared flour mixes
Coreal
Rice
Pasta (dry) and cormes)
Bakery products
White brand
Other bread
Frash biscults, rolls, and muffins
Cakes and cupcakes
cook tos
Crackers
Brad and cracker products
Doughnuts and sweetrolis
Frozen and refrigerated bakery products
Fresh pios, tarts, and turnovers
Mats, poultry, fish, and eggs
Meats
Beaf
Ground beaf (bectuding canned)
Chuck roast
Round razs:
Dther roast
Round steak
Striotn steak
Other steak
Other beef (exciuding camed)
Pork
Bacon
Ports ehops
Him (excluding canned)
Dther pork
Pork sausage
Canned hat

[^0]:    *Devid M. Smallwood is an macuitural economist with the
    Conmodity Eonncricz Division, Boonomic Researth Service, U.S. Depertment of Agricuthore.

[^1]:    Technical descriptions of the BLS-CCES and definitions draw heavily from Connmer Expenditure Survey: Diery Survey 1982-83, Bullexin 2245, Bureau of Labor Siatiatics, U.S. Department of [abor, 1986 and documentation distributed with the public use taper.

[^2]:    The definition of "compiete income reporting" used in the 1980-86 CCES differs from the $1972-73$ definition. A consumer unit feporting zero income in 1972-73 wus considered a complete respondent as Ions as there was no evidence of ituent to sufure the income quertion. In the CCES, acrovi-the-board zero income reporting was denignted as invalid by BLS, and the consumer unit wat catesorized as in incomplete reporter. Neither survey, however, accounted for posrible undersiporting. Conamer wits designated as incomplete reporters of income are excluded from computations of average income in this report.

[^3]:    The field operation for the 1987-88 USDA Nationwide Food Consumption Survey have recently been completed but the date are not expected to be available unil eatly 1990.

[^4]:    1/ Computed from axpendituras reported in table 10 using the 1980 item oxpanditure lovel as 100 pertent 2/ Includet other romats and other steak categories.
