**Farm Business Balance Sheet, 1960-91: United States and by State.**  
By Kenneth Erickson, Janusz Kubica, Duane Hacklander, Charles Barnard, James Ryan, and Helen Devlin. Agriculture and Rural Economy Division and Data Services Center, Economic Research Service, U.S. Department of Agriculture. Statistical Bulletin No. 856.

#### **Abstract**

This report furnishes the latest farm business balance sheet estimates developed by the U.S. Department of Agriculture's Economic Research Service. These estimates incorporate numerous revisions in estimating procedures and changes in available data. National and State-level estimates of assets, debt, and equity are presented for 1960-91.

**Keywords:** Balance sheet, assets, debt, equity, States, United States.

#### **Acknowledgments**

### Introduction

The balance sheet accounts are used to assess wealth in the farm sector. They include assets, debt, and equity, where equity equals assets minus debt. Assets are valued at market prices on December 31 of each year, or as close to December 31 as possible. Nominal and real capital gains on farm assets and debt are estimated.

Both operators' and landlords' shares of the assets and debt for the farming operation are included. Debt is classified as either real estate or nonreal estate, depending upon how the loan is secured. If the loan is secured by farm real estate, then it is classified as real estate farm debt, regardless of how the loan is used.

This report provides a historical data series of accounts which are published annually in *Economic Indicators of the Farm Sector*. ERS will discontinue the balance sheet that includes farm operators' household assets and debt, and shall, henceforth, only publish a farm business balance sheet (excluding operator households). This was decided because of the complexity of separating farm household accounts between farm and nonfarm activities. This complexity has evolved, in part, because of growth in the importance of off-farm employment to farm households. Also, most financial surveys of the farm sector have focused on the farm business and even when an attempt is made to obtain financial data for the household, the surveys focus only on the operator. The value of operator and other dwellings will be published separately from farm business assets.

### Assets

Total U.S. farm business assets are shown in figure 1 for the period 1960-91. Total assets are displayed relative to total debt and equity. Figure 2 shows the two major categories of farm assets (real estate and nonreal estate) relative to total assets.

## **Real Estate Assets**

Real estate assets constitute land and buildings in the farm business sector. Buildings are divided into operator dwellings, other dwellings that are part of the farm operation, and service structures. Other dwellings are dwellings that are not operator or hired-labor dwellings. Service structures include hired-labor dwellings, grain storage facilities, barns, machine sheds, and nursery and greenhouse structures. Real estate assets are calculated by subtracting the value of operator dwellings and other dwellings from the total real estate value.

Real estate assets are calculated for each State and aggregated to a U.S. total. Before 1988, an average value of land and buildings per acre was used as the basis to estimate total value of land and buildings by State. Starting in 1988, land and buildings were estimated separately. Land value is calculated by multiplying the acres of land in farms as of June 1, published by the U.S. Department of Agriculture's National Agricultural Statistics Service (NASS), times the State average value per acre of land as of January 1 of the following year. Land values are published by the Resources and Technology Division of the U.S. Department of Agriculture's Economic Research Service (ERS). Average land values are benchmarked to the census of agriculture data and updated annually using RTD's annual Agricultural Land Value Survey. Starting in 1987, the average land values for eight States (New Hampshire, Massachusetts, Rhode Island, Connecticut, New Jersey, Arizona, Nevada, and California) are adjusted to reflect the Agricultural Economics and Land Ownership Survey (AELOS) average values instead of 1987 Census of Agriculture values. This adjustment is the result of discussions with personnel at the Bureau of the Census to reflect more accurate average market values.

Building values, excluding other dwellings, are added to the land value by dividing the land value by one minus the building ratio. The building ratio is calculated by dividing total building value, excluding the value of other dwellings, by total real estate value, excluding the value of other dwellings. The relationships of building values to total real estate values were obtained in the 1988 AELOS by State. These ratios are adjusted annually using a 3-year moving regional average obtained from the Farm Costs and Returns Survey (FCRS). Since FCRS is a survey of operators, the implicit assumption is that the portion of the building ratio attributable to landlords changes in the same relative magnitude each year as does the operator-owner portion.

Operator dwelling values are derived by multiplying AELOS dwelling ratios times building values, excluding other dwellings. The dwelling ratio is the value of operator dwelling divided by the total building value, excluding the value of other dwellings. The average dwelling ratio changed less than 2 percentage points between the 1979 Farm Finance Survey conducted by the Bureau of the Census and the 1988 AELOS, so currently the dwelling ratios are being held constant at the 1988 levels. As more FCRS data are collected, this decision will be re-evaluated to see if a mover system should be incorporated.

The value of other dwellings is calculated as 11 percent of the value of operator dwellings based on relationships found in FCRS data. The other dwellings' value is added to the total land and buildings, excluding other dwellings, to obtain the total value of land and buildings by State. When a question about the value of other dwellings owned by the operation was added to the FCRS, the real estate values increased substantially. Thus, the assumption is made that the census of agriculture does not include the value of these other dwellings in its land and buildings totals, just as earlier versions of FCRS probably missed them also. Again, as more FCRS data are accumulated, this constant relationship will be re-evaluated, especially for regional differences.

#### **Nonreal Estate Assets**

Nonreal estate assets include livestock and poultry, machinery and motor vehicles, crop inventories, financial assets, and purchased inputs. Figure 3 displays the relative magnitude of the components of nonreal estate assets for the period 1960-91.

**Livestock and poultry.** Livestock and poultry inventories are reported for the United States and each State by NASS for cattle and calves, hogs and pigs, sheep, and chickens (excluding commercial broilers). Although livestock and poultry values are reported in the balance sheet as of December 31, data are not always available for that date. NASS reports inventories of cattle and calves, and sheep for December 31. However, the balance sheet uses the NASS inventories of hogs and pigs, and chickens, reported as of December 1, without adjustment. NASS combines seven States' value and number of sheep, which are included in the U.S. total but are not allocated to individual States. NASS revises data as new information becomes available. Revisions are incorporated into subsequent balance sheet figures.

**Machinery and equipment.** Machinery and motor vehicle values are estimated for four main components: tractors, trucks, automobiles, and other farm machinery. The value of equipment leased from dealers and manufacturers is not part of this account.

A perpetual inventory method is used to estimate December 31 stocks for each machinery component. This method considers current ending stocks to be equal to last period's ending stocks, plus capital expenditures, less accidental damage, value of losses, and depreciation. The percentage change from the previous year's value is applied to the previous year's inventory levels.

At the State level, only the value of machinery and motor vehicles is published. The State values are derived from the U.S. total value by using distributors based on machinery and motor vehicle values per farm from the latest census of agriculture times the number of farms published by NASS. These distributors are adjusted for the intracensus years when a new census of agriculture is released.

**Crops.** Crop inventories include all crops held on farms, except those under Commodity Credit Corporation (CCC) loans, but exclude crops not yet harvested and stocks held by the processing and distribution sectors. The balance sheet also excludes farmer-owned, off-farm stocks because of insufficient data. Crop inventory data are primarily from NASS publications.

Crop categories include feed grains, food grains, oil crops, hay and forage, cotton, tobacco, and other crops. The data are summed for each crop by State to give national totals. These U.S. totals include the value of any unallocated stocks, that is, stocks not allocated to a particular State. The unallocated crop values are apportioned to the unallocated States in relationship to the level of crop production for each of these States.

In 1986, the calculation of crop inventories was changed to exclude crops under loan to CCC. This change made the treatment of CCC crop loans in the balance sheet consistent with ERS income accounts, which treat CCC loans as cash income because of the nonrecourse provision of CCC crop loans. If the market price for crops stored under CCC loan exceeds the loan price on December 31, the value of this difference is included as a farm asset.

Changes in the date when NASS reported most grain and soybean stocks required new procedures for estimating year-end stock levels beginning in 1986. To estimate yearend stocks of crops, reported stock levels closest to the end of the year are used as a starting point. These stock levels are adjusted for production (when only beginning stocks of the crop year are reported), monthly marketings, and farm use. Farm use before December 31 is estimated using the FCRS and historical relationships.

Where only U.S.-level data are available, as with cottonseed, for example, the stock quantities are distributed to each State based on an allocation method. For example, ERS obtains U.S. total farm value and quantity of cottonseed inventories as of January 1 from NASS. The quantity of cottonseed inventories is then distributed to each State based on the State's percentage distribution of cottonseed production. The State's inventory is then multiplied by the State's December price received for cottonseed to obtain the inventory value.

**Financial assets.** Financial assets include items such as demand deposits, currency, and investments in cooperatives. Changes in values of financial assets are based on the annual percentage change for the United States as a whole, and assume that farm sector financial assets grow at the same rate. State-level financial assets are estimated using distributors based on benchmark financial assets per farm times the current number of farms as a percentage of the U.S. total. The FCRS may provide improved data for allocating farm financial assets by State. Separate estimates of farm financial assets by category are no longer being published because of lack of recent farm-level data to distinguish among the various categories of financial assets. The balance sheet accounts include four categories of cooperatives: farmer-owned marketing and purchasing cooperatives, rural telephone cooperatives, rural electric cooperatives, and Farm Credit System

(FCS) cooperatives. When farmers become members of a farmer-owned cooperative, they purchase stock or contribute to membership capital. This stock is not traded on any exchange, but does have value to the farmer and is closely related to the farm business. Since only U.S.-level data are available for the net worth of Federal land bank (FLB) and of other cooperatives, State-level estimates are allocated to each State using the percentage distribution of FCS debt by State.

**Purchased inputs.** Purchased inputs include the value of feed, seed, fertilizer, fuels, and other supplies. The U.S. inventory value is obtained from the annual FCRS survey. The State inventory values are derived from the U.S. total using a 3-year moving average distributor. A 3-year moving average is used at the State level because the annual FCRS sample size becomes fairly small, especially for certain States. The State average is taken as a percentage of the 3-year moving U.S. average and applied to the annual U.S. total purchased inputs inventory value.

#### Debt

Farm sector debt, as presented in the balance sheet, is limited to debt reported by lending institutions and estimated debt owed to noninstitutional (individuals and others) creditors. Accrued liabilities, such as accrued interest and other payables, are not estimated in the farm-sector balance sheet. Total debt is reported for each lender, with longer term real estate debt and shorter term nonreal estate debt listed separately. Only debt incurred by those involved in onfarm agricultural production, either as operators or as nonoperator landlords, is included in the balance sheet. Debt owed by firms and individuals performing the input supply, processing, distributing, or marketing functions for farms is excluded from the balance sheet. Figure 4 portrays total debt, real estate debt, and nonreal estate debt for 1960-91. Figure 5 presents the historical percentage of total debt held by major lenders.

#### Real Estate Debt

Farm-sector real estate debt includes loans and mortgages held by the Farm Credit System (through Farm Credit Banks and Agricultural Credit and Federal Land Bank Associations), the U.S. Department of Agriculture's Farmers Home Administration (FmHA), life insurance companies, commercial banks, individuals and others, and the Commodity Credit Corporation for loans on storage and drying facilities.

Real estate debt is presented for each credit source. To determine debt levels for the farm business account, the proportion of each lender's real estate debt assigned to operator dwellings is deducted. The estimate of debt attributable to operators' dwellings is based on the relationship of operator dwelling values to total real estate values as reported in the 1988 AELOS.

FCRS data are being used to update estimates of value for operator dwellings. Survey results to date indicate that a larger than proportional share of the value of operator dwellings is on farms with little or no debt. This suggests that debt should be attributed to dwellings at a rate about half the dwelling value percentage of total real estate assets. In the farm business accounts, debt is obtained for each lender by applying this modified dwelling value percentage to total real estate loans, then reduced by the amount attributable to dwellings.

**Farm Credit System.** Prior to reorganization of the FCS, the balance sheet considered all agricultural loans held by the FLB to be farm real estate debt. Following the mergers of some Federal Land Bank Associations and Production Credit Associations into Agricultural Credit Associations, reporting of real estate and nonreal estate debt along institutional lines is not as distinct. However, the Federal Farm Credit Banks Funding Corporation reports national levels of long-term farm mortgage and production and intermediate-term loans in its annual information statement.

Since 1987, within-district distributions have been drawn from the FCRS. Beginning in 1988, Farm Credit Banks annual reports, for most districts, have contained distributions of total debt by loan type and by State. These distributions are checked against FCRS distributions in determining final State debt levels.

**Farmers Home Administration.** The farm-sector balance sheet identifies loans made under specified FmHA direct loan programs as farm real estate debt. Farmer program loans listed as real estate debt include those for farm ownership (both regular and limited resource), soil and water, grazing association, and Indian tribe land acquisition. Half of the economic emergency loans are considered real estate debt. Nonfarm enterprise loans are not considered as farm debt, since they involve a wide variety of nonagricultural commercial activities.

Rural housing loans with annual payments and farm labor housing loans are also listed as farm-sector real estate debt. The series excludes FmHA rural residential loans with monthly payments because they usually belong to off-farm residents or nonfarm rural residents. FmHA publishes quarterly data on outstanding principal under each of these loan programs for the Nation and by State.

**Life Insurance Companies.** The balance sheet lists life insurance company farm mortgages as farm real estate debt. ERS has historically obtained data from the *Life Insurance Fact Book* published annually by the American Council of Life Insurance. The Fact Book provides a preliminary estimate of farm mortgages outstanding in mid-July of each year.

**Commercial Banks.** Farm real estate debt held by banks includes loans made by all insured commercial banks. Banks file quarterly reports, commonly referred to as call reports, meeting the joint requirements of the Federal Reserve

Board, the Federal Deposit Insurance Corporation, and the Comptroller of the Currency. Banks report loans secured by farmland as a component of their real estate loans outstanding. The balance sheet uses this number, computed by State from the call report data, as farm real estate debt.

**Individuals and Others.** Individuals and others debt is benchmarked to the 1988 AELOS. The current year's estimate is obtained by adjusting the amount from the preceding year, based on the ERS estimate of the proportion of real estate sales financed by sellers, as reported in *Agricultural Resources: Agricultural Land Values and Markets, Situation and Outlook Report*. The estimate of total debt to individuals and others is allocated to States using the distributions from AELOS.

Sellers often act as lenders in real estate transactions. Frequently, the seller accepts a downpayment from the purchaser, and holds a note and mortgage for the balance due. Sellers often are farmers who remain active in the sector. To an extent, an increase in debt attributable to seller financing remains within the sector as an asset (note receivable) of the selling farmer. Title to the property passes to the purchaser, and the seller is the mortgagee. Alternatively, land is often sold on a land contract, under which title does not pass to the purchaser until the completion of a certain event, usually the substantial or complete payment of the amount owed the seller. Estimation of debt held by sellers who financed the sale of farmland has been difficult, due to the extensive forbearance on the part of seller-mortgagees, and renegotiation of interest rate and contract terms between buyers and sellers as land values declined from 1981 through 1986. Sellers unwilling to renegotiate contract prices and terms with purchasers foreclosed and returned to farming.

Real estate credit sources expanded in response to the farm financial stress of the mid-1980's. Several States created or increased funding for farm loan boards to help farmers obtain credit. The Wyoming Farm Loan Board, for example, reported that real estate loans increased from \$45 million in 1975 (less than 11 percent of total farm real estate loans in the State) to \$239 million in 1987 (almost 37 percent). Estimates of debt held by individuals and others have implicitly accounted for State programs only when such debt was benchmarked to census data. Current balance sheet procedures use AELOS as a benchmark.

**Commodity Credit Corporation.** CCC storage and drying facility loans are included as real estate loans in the farm sector balance sheet. This program is in a paydown position, as outstanding loans have declined from \$1.5 billion in 1980 to less than \$5 million in 1991.

#### **Nonreal Estate Debt**

Farm-sector nonreal estate debt includes loans by commercial banks, the FCS (through Production Credit and Agricultural Credit Associations), FmHA, and individuals and others.

Total nonreal estate debt is reported by, or estimated for, each lender. To determine debt levels for the farm business accounts, a proportion of each lender's nonreal estate debt is assumed to have been for nonfarm purposes, and is deducted. Debt attributable to nonfarm purposes is based on the relationship of farm business debt to total debt as reported in the Farm Finance Survey.

**Commercial Banks.** Farm nonreal estate debt held by banks includes loans made by all insured commercial banks. In quarterly call reports, banks report loans to finance agricultural production and other loans to farmers as a separate item. The balance sheet uses this number, computed by State from the call report data, as total nonreal estate debt. For the farm business accounts, discussions with commercial bank loan officers suggest that 5 percent of these loans should be allocated to nonfarm purposes.

**Farm Credit System.** Before the FCS reorganization, the balance sheet identified as nonreal estate debt all agricultural loans held by Production Credit Associations and by Federal intermediate credit banks through other financial institutions. Now, FCS total nonreal estate debt is that amount reported by the Federal Farm Credit Banks Funding Corporation as production and intermediate-term loans in its annual information statement.

Since 1987, within-district distributions have been drawn from the FCRS. Beginning in 1988, Farm Credit Banks annual reports, for most districts, have contained distributions of total debt by loan type and by State. These distributions are checked against FCRS distributions in determining final State debt levels. Four percent of this amount is deducted in the farm business accounts.

**Farmers Home Administration.** Certain FmHA direct loans are recognized as nonreal estate debt in the farm-sector balance sheet. Farmer program loans listed as nonreal estate debt include regular, limited resource, and youth operating loans. Emergency disaster, economic opportunity, and half of the economic emergency loans are also considered nonreal estate debt. FmHA publishes quarterly data on outstanding principal under each of these loan programs for the Nation and by State.

Loans in some of these programs are made to assist families during difficult times. Therefore, 12 percent of total FmHA nonreal estate loans are considered to be made for nonfarm purposes. In the farm business accounts, this amount is deducted from the reported total.

**Individuals and others.** Total nonreal estate farm debt held by individuals and others is benchmarked to AELOS, and annually adjusted based on FCRS, an annual survey of farm machinery manufacturers' credit corporations, and reported Small Business Administration (SBA) farm loans. In the farm business accounts, 2 percent of these loans are considered to be for nonfarm purposes.

The SBA no longer makes agricultural loans. Most of its outstanding loans are disaster loans made during 1977-81. Two-thirds of SBA loans are secured by junior liens on farm real estate. However, due to the questionable security value of these second, third, and fourth mortgages, all SBA loans are considered nonreal estate.

Analysis of available financial data suggests a close relationship between nonreal estate debt held by individuals and others and expenses for intermediate products. This relationship is used in distributing individuals and others debt by State.
