U.S. Fresh Fruit Export and Consumption Estimates, 1978-92. By Diane

Bertelsen. Commodity Economics Division, Economic Research Service, U.S. Department of Agriculture. Statistical Bulletin No. 875 .

#### Abstract

During 1978-89, the United States exported more fresh fruit than had been reported by the Bureau of the Census. Import data made available by Statistics Canada revealed that some shipments of fresh fruit from the United States to Canada had not been counted by the Bureau. Using the Canadian data raised total U.S. fruit exports and lowered consumption. The author determined that U.S. consumption of citrus fruits was 5 percent lower and consumption of noncitrus fruits was 1 percent lower than previously estimated. Since 1990, the Bureau of the Census has used Canadian import data as a measure of U.S. exports to Canada. This bulletin reports the revised U.S. exports and per capita consumption for 13 fresh fruits: grapefruit, lemons, limes, oranges, tangerines, apples, avocados, sweet cherries, grapes, peaches and nectarines, pears, prunes and plums, and strawberries. The report also includes 40-year trends for fresh fruit consumption.

Keywords: Exports, consumption, citrus, noncitrus, fruit.

## Summary

During 1978-89, the United States exported more fresh fruit than had been reported by the Bureau of the Census. Import data made available by Statistics Canada revealed that some shipments of frest fruit from the United States to Canada had not been counted by the Bureau. Using the Canadian data raised total U.S. fruit exports and lowered consumption. The author determined that U.S. consumption of citrus fruits was 5 percent lower and consumption of noncitrus fruits was 1 percent lower than previously estimated. Since 1990, the Bureau of the Census has used Canadian import data as a measure of U.S. exports to Canada. This bulletin reports the revised U.S. exports and per capita consumption for 13 fresh fruits: grapefruit, lemons, limes, oranges, tangerines, apples, avocados, sweet cherries, grapes, peaches and nectarines, pears, prunes and plums, and strawberries. The report also includes 40 -year trends for fresh fruit consumption.

Substituting Canadian import data for U.S. export data reduced annual estimates of fresh-market orange and grape consumption the most, an average 7 percent. Exports of these commodities to Canada were substantially underreported; Canada was a major destination, receiving $50-75$ percent of all U.S. orange and grape exports. Because exports averaged about 25 percent of orange and grape supplies during the study years, raising exports markedly reduced consumption.

Annual consumption estimates for fresh-market avocados, limes, peaches, and strawberries were lowered just 2-3 percent, on average, despite substantial underreporting of U.S. exports during 1978-89. Canada was the destination for more than 80 percent of U.S. peach and strawberry exporis, about 70 percent of the limes, and nearly 50 percent of U.S. avocado exports. However, even after the author revised the data, avocado exports were less than 10 percent of total U.S. supplies. Thus, upward adjustments of exports had little impact on consumption estimates.

Annual consumption estimates for firesh-market apples were revised downward barely 1 percent, on average. Canada accounted for about 25 percent of U.S. apple exports and adjusting for underreporting raised total U.S. exports an average of only 10 percent. The effects of higher exports on consumption estimates were dampened further because exports averaged just 12 percent of U.S. fresh-market apple supplies during the study period.

Pear consumption estimates were reduced only about 2 percent because exports were just 14 percent of supplies. Although Canada accounted for about 50 percent of U.S. pear exports, the degree of underreporting was less than for the other fruits. Total annual pear exports were revised upward an average 15 percent.

Grapefruit exports, however, were relatively large compared with total supplies, averaging nearly 30 percent. Thus, modest adjustments for underreported exports to Canada lowered annual consumption estimates by an average of 5 percent during the study period, 1978-89.

Annual consumption estimates for lemons, sweet cherries, and plums were dropped an average 3 percent. Lemon exports were neariy 40 percent of supplies, but Canada was not a major market, accounting for only 12 percent of U.S. lemon exports on average during the study period. Canada was an important market for sweet cherries and plums, accounting for 45-60 percent of
U.S. exports. However, total exports were only about 20 percent of cherry and plum supplies, dampening the effect of higher exports on consumption estimates.

Tangerine consumption rose when the author substituted Canadian import data for U.S. export data. For most of the study years, the Canadian data showed lower tangerine imports from the United States than previously reported. Definitional differences between the U.S. and Canadian trade code descriptions were probably responsible for the discrepancy. Before 1988, Canada's description listed only "satsuma" rather than the U.S. code's broader "tangerines and other mandarins." Canadian data showed annual imports of U.S. tangerines were an average 35 percent lower than previously reported, and Canada received 45 percent of total U.S. tangerine exports. Because exports were small compared with total U.S. supplies during the study years, tangerine consumption estimates rose just 3 percent.

# U.S. Fresh Fruit Export and Consumption Estimates, 1978-92 

Diane Bertelsen

## Introduction

Before 1990, U.S. exports to Canada, as reported by the Bureau of the Ceissus, U.S. Department of Commerce, were substantially understated because of undocumented shipments. Since 1990, the Bureau of the Census has used Canadian import data as a measure of U.S. exports to Canada. The underreporting of exports to Canada was especially troubiesome for fruit analyses because Canada accounted for a large share of U.S. fresh-market fruit exports.

To correct for the underreporting, the Economic Research Service (ERS), USDA, obtained estimates of Canadian imports from the United States from Statistics Canada. ERS then substituted the Canadian import data for the Bureau of the Census estimates of U.S. exports to Canada from 1978 through 1989 for 13 fresh-market fruits: apples, avocados, sweet cherries, grapefruit, grapes, lemons, limes, oranges (and temples), peaches (and nectarines), pears, plums (and prunes), strawberries, and tangerines. Export quantities were revised for 12 marketing years (1978/79 through 1989/90) or, depending on the commodity, calendar years (1978 through 1989).

Substitution of Canadian impon data for U.S. export data raised total U.S. exports, thus reducing prior estirnates of the quantities of fruit available for domestic consumption. The extent of revisions to per capita consumption estimates depended on (1) the magnitude of the underreporting, (2) Canada's share of total U.S. exports, and (3) the importance of exports compared with total U.S. supply.

This report contains revised annuai estimates of U.S. exports and per capita consumption for the 13 freshmarket fruits, reflecting substitution of 1978-89 Canadian import data for U.S. export data. The analysis was extended to include the most recent years for which data were available, 1990-92. Finally, 40-year trends in fresh-market fruit consumption, including revisions, are examined.

## U.S. Fruit Exports to Canada

The underreporting of U.S. fresh-market fruit exports to Canada varied considerably from month to month and year to year for the 13 fresh-market fruits considered. The substitution of Canadian import data for U.S. export data generally raised exports of most fruits, but in a few years revisions resulted in lower exports to Canada.

Exports of U.S. avocados to Canada had been extensively underreported by the U.S. Department of Commerce and substituting Canadian import data caused large upward revisions (see page 20). The average change in annual avocado exports to Canada for the 12-year period, 1978-89, was +225 percent. Revisions to annual U.S. avocado exports to Canada varied from a 7-percent increase in 1980 to a 743-percent increase in 1987.

Substituting Canadian for U.S. data raised strawberry exports to Canada an average of 125 percent, with increases for given years varying from 31 percent in 1978 to 229 percent in 1989 (see page 32). Lime exports in 1979/80 were reduced 26 percent, but revisions were more than 200 percent higher during 1986/87-88/89 (see page 12). Overall, Canadian data showed that annual U.S. lime exports to Canada were double those previously reported.

Apples, pears, and sweet cherries had the least underreported exports to Canada. Substituting Canadian import data raised U.S. apple exports to Canada an average of about 55 percent during 1978/79-89/90 (see page 18). Revised pear exports to Canaóa averaged 32 percent higher than previous estimates, and cherry exports to Canada were revised upward more than 40 percent on average (see pages 28 and 22).

## Canada's Share of U.S. Fruit Exports

Correcting the underreporting of U.S. fresh-market fruit exports to Canada raised total U.S. exports
significantly because Canada accounted for a large share of U.S. fruit exports. After substirution of Canadian import data for U.S. export data during 1978/79-89/90, Canada's share of all U.S. freshmarket fruit exports averaged 38 percent. Canada accounted for about half of U.S. noncitrus fruit and a third of citrus fruit exports (figs. 1, 2, and 3 ).

Canada's share of U.S. fruit exports declined after the mid-1980's as U.S. exporis to the rest of the world increased. Yet, Canada remains an important U.S. market. In 1978/79, 44 percent of all U.S. fresh-market fruit exports went to Canada compared with 28 percent in 1991/92. Canada accounted for 38 percent of U.S. total citrus truit exports in 1981/82, but only 24 percent in 1990/91 and 1991/92. Canada's share of U.S. noncitrus exports dropped from 62 percent in 1979/80 to 33 percent in 1991/92.
U.S. fresh-market fruit exports to Canada averaged 1.4 billion pounds in 1978/89, with nearly equal amounts of citrus and noncitus. However, fresh citrus fruit exports to Canada declined during the 1980's, from 880 million pounds in 1979/80 to 640 million pounds in 1989/90. Noncitrus exports rose over the same period, from 570 million to 780 million pounds. Damaging freezes reduced supplies of Fiorida citrus several times in the 1980's and California oranges in 1990/91. In contrast, U.S. supplies and exports of noncitrus fruit increased in the $1980^{\circ}$ s.

Most U.S citrus exports to Canada from 1978/79 through 1989/90 were oranges ( 70 percent) and grapefruit (22 percent). Nearly half of all U.S. orange and tangerine exports went to Canada, but only about 20 percent of U.S. grapefruit and 12 percent of lemon exports. Canada was the destination for about 70 percent of U.S. lime exports.

Apples and grapes dominated U.S. fruit exports to the world from 1978/79 through 1989/90, accounting for 43 percent and 26 percent, respectively, of freshmarket noncitrus exports. However, grapes were the major noncitrus export to Canada (about 40 percent), with apples just 22 percent of U.S. noncitrus exports to Canada. Canada produces apples and accounted for about 25 percent of U.S apple exports from 1978/79 through 1989/90. However, mast U.S. exports of other fresh-market noncitrus fruit went to Canada: 85 percent of peach (and nectarine) and strawberry exports, 75 percent of grape exports, 60 percent of plum (and prune) exports, 50 percent of pears and avocados, and 45 percent of U.S. sweet cherry exports.

## Revised Total U.S. Fruit Exports

Adjusting for the underreporting of U.S. fruit exports to Canada raised total U.S. exports, but the effect of the adjustment on total exports varied among fruits, depending on the share of total U.S. exports that Canada received in a given year. For example, if Canada accounted for hall of total U.S. exports, a 50 -percent increase in exports to Canada raised total U.S. exports by 25 percent. However, if just 10 percent of total U.S. exports were to Canada, a 50 percent increase in exports to Canada raised total exports only 5 percent. The largest revisions in total U.S. exports were for strawberries and peaches, while apple and lemon exports had the smallest relative changes.

Revised total U.S. exports of fresh-market strawberries averaged nearly 90 percent higher than previously reported. Increases in arinual total strawberry exports ranged from 25 percent in 1978 to 155 percent in 1988. After revision, 1984 and 1985 peach exports were more than doubled. Total U.S. exports of grapes, limes, and avocados were raised an average of about 45 percent over the 12 . year period.

Correcting for underreported U.S. exports to Canada resulted in relatively small revisions to total U.S. apple exports. After revision, annual apple exports to the world averaged 10 percent higher, ranging from a 2-percent increase in 1980/81 to a 21 -percent increase in 1986/87. Total U.S. orange exports increased nearly 30 percent on average, atter revision, with changes varying from 19 percent in 1984/85 to 34 percent in 1978/79. Total U.S. lemon exports were revised the least, with annual exports raised an average cf 5 percent.

## Export Shares of Supplies

U.S. fresh-market fruit supplies are the sum of utilized domestic production, imports, and beginning stocks. Supplies can be exported, stored, or consumed. Thus, the effect of revised exports on consumption depended, in part, on the significance of exports compared with total supplies. For the 13 fresh-market fruits considered, revised exports utilized as little as 6 percent or as much as 38 percent of supplies, on average during 1978-89.

After their adjustment for underreported U.S. exports to Canada, fresh fruit exports averaged 20 percent of total supplies in 1978-89. For all citrus fruits, exports

Figura 1
U.S. fresh-market citrus fruit exports

Figure 2
U.S. freshi-market noncitrus fruit exports

Figus. ${ }^{3}$. fresh-market fruit exports

averaged 30 percent of supplies, with lemon expots 38 percent of lemon supplies, grapefruit exporis 30 percent of grapefruit supplies, and orange exports 24 percent of orange supplies (figs. 4,5, and 6).

For many of the fresh-market fruits, exports were small compared with total supply, so even large revisions in export quantities had little effect on consumption. Exports of avocados, peaches, limes, strawberries, and fangerines averaged less than 10 percent of total U.S. supplies during 1978-89, even after correcting for underreported exports to Canada. For grapes, sweet cherries, and plums, revised exports were about 20 percent of supplies. Lower export shares for apples ( 12 percent) and pears (14 percent) brought the average for all noncitrus fruit exports during 1978/79-89/90 down to 13 percent of

## Per Capita Consumption

Substituting Canadian import data for U.S. export data in 1978-89 raised annual quantities of U.S. fruit shipped to Canada and decreased domestic consumption. However, revisions to aggregate annual consumption estimates were not large. Annual estimates of fruit consumption in 1978-89 were lowered an average 5 percent for citrus and 1 percent for noncitrus. Estimates of all fruit consumption came down about 2 percent each year (table 1).

During 1978-89, U.S. consumption of all fresh citrus fruit was 22-28 pounds per capita, after revision. Oranges were 50-55 percent and grapefruit 25-30 percent of citrus fruit consumption in 1978-89. Prior estimates were revised downward an average of 7

Figure 6
U.S. fresh-market fruit exports, consumption, and supplies

percent for oranges, 5 percent for grapefruit, 3 percent for lemons, and 2 percent for limes. On the other hand, tangerine consumption estimates increased 3 percent. Exports to Canada were likely understated before 1988 when the code description changed from one type of mandarin "satsuma" to "satsumas and other mandarins."

Revised exports to Canada lowered estimates of 1978-89 noncitrus fruit consumption only about 1 percent on average. Grape consumption estimates were revised downward an average 7 percent, while other noncitrus fruits had smaller changes. Consumption estimates for sweet cherries, plums, and strawberries decreased an average 3 percent Avocado, peach, and pear consumption estimates were revised downward 2 percent, and apple consumption only 1 percent, on average.

Banana consumption was included with the aggregate noncitrus fruit estimate, although it was not affected by revised exports to Canada. During 1978-89, banana consumption was $20-26$ pounds per capita, exceeding apple consumption of 17-21 pounds. The 1991 estimates showed banana consumption still leading at 25.3 pounds per capita, 36 percent of major noncitrus fruit consumption, followed by apples, at 18.7 pounds and 27 percent of all noncitrus fruit consumption.

Estimates of 1991 fresh fruit consumption showed a decrease of 2.3 pounds per capita from the year earlier, based on a 0.3 -pound increase in noncitus that was more-than-offset by a 2.6 -pound decline in citrus consumption. A sharp drop in the supply of fresh-market oranges, due to freeze damage in California, pushed the 1991 orange consumption estimate down nearly 4 pounds from the prior year to 8.5 pounds--the lowest ever estimated.

## Consumption Trends

Trends in fruit consumption were demonstrated by the use of 5-year-centered moving averages to smooth the year-to-year differences that result mainly from fluctuations in production. Movingaverage estimates also compensate for the lack of beginning and ending stock data and the unavoidable mixture of marketing years when combining different fruits (fig. 7).

Fresh-fruit consumption estimates fell off in the 1950's as commercial processing increased and less fresh-marketed fruit was purchased to be squeezed, canned, or frozen at home. The year-around availability of frozen concentrate orange juice greatly reduced the use of fresh-marketed oranges for juice. The decline of fresh citrus fruit consumption in the 1980's was primarily due to several major freezes that reduced production and drove up prices. Abundant citrus crops and lower prices in the early1990's stimulated consumption. The upswing in total fresh-market fruit consumption that began in the 1970's was due to increased noncitrus fruit consumption. Improvements in transportation and storage technology increased the availability of a wide variety of fruit throughout the year. Better informed consumers, aware of health benefits, tried to include more fresh fruit in their diets. Annual imports of bananas and domestic production of apples have each risen by about 2 billion pounds ( 50 percent) since 1970. The supply of grapes has grown even more dramatically, with a doubling of production and a tenfold rise in imports.

Consumption of fresh noncitrus fruit rose about 40 percent from 1970 to the mid-1980's, and recent estimates have been back up to the 1950 level of about 70 pounds per capita.

Figure 7
Consumption of fresh-market fruit (5-year centered moving average)

## How We Estimate Consumption

U.S. consumption is calculated from residual supply. Total U.S. supply is the sum of utilized domestic production and imports. If commodities are storable and stock estimates are available, beginning stocks are added to total supplies. Total supplies can be exported, stored, or consumed. Subtracting exports and ending inventories, if any, from supplies leaves apparent total consumption. Per capita consumption estimates are obtained by dividing total consumption by the total U.S. population estimate (including Armed Forces overseas).

Annual consumption estimates for citrus, noncitrus, and all fruit are calculated by combining various marketing years. For example, 1985 fruit consumption combines the 1984/85 citrus crop and 1985/86 noncitrus crop. Citrus marketing seasons begin late in the year: California oranges in November and Florida grapefruit in September. Thus, most fresh-market citrus fruit from 1984/85 crops was shipped in 1985. Shipments of noncitrus fruit generally start earlier than citrus and, for highly perishable fruits, continue for only 2-3 months. So, most of the noncitrus fruit available for consumption in 1985 was from the 1985/86 marketing year.

## New from USDA's Economic Research Service CALL-ERS

CALL-ERS is a new electronic bulletin board service available free to users of ERS information and data. Use CALL-ERS to:

- Download timely situation and outlook summaries
- Download selected situation and outlook tables as electronic spreadsheets.
- Download samples of electronic data products.
- Stay informed about new reports and data products from ERS.

Shop our on-line catalog for periodicals, reports, videos, and data products.
CALL.ERS supports 1200 and 2400 baud communications ( $\mathrm{N}, 8,1$ ) on 1-800-821-6229 and 1-202-219-0377.

Call from your computer today!

## Stay Current

- Agricultural and economics statistics and analysis.
- Commodity analysis.
- Food consumption.
- Foreign trade.
- Biotechnology.
- Rural development.
- Banking.
- Land use.
