No. 20

July 10, 1924

Prepared by the Farm Management Group at University Farm, St. Paul, Minn. Andrew Boss, G.A. Pond, L.B. Bassett, W.L. Cavert, L.F. Garey, A.T. Hoverstad

## The Farmers Income in 1923

Much has been said and written about the small incomes and large expense bills of farmers during these years of agricultural depression. While it is generally known that farmers incomes have been distressingly low, little information has been available as to just how low they are. In the following tables are presented the items of income and expense on groups of farms in two areas in southern Minnesota representing the principal types of farming practiced there. The farms in the Steele County group average 188 acres in size with a range of from 92 to 357 acres, while the range in Cottonwood and Jackson counties is from 80 to 273 acres and the average size 171 acres.

In type these farms are fairly representative of the section of the state in which they are located. They are, however, probably somewhat more successful than the average farm of the area since they have been keeping complete cost accounts for several years and have made some gains in efficiency of production as a result. The income in Steele county was reduced in 1923 by a severe drouth which cut the corn and hay yields to one-half to two-thirds of a normal crop and greatly reduced the value of pastures. In Cottonwood and Jackson counties, on the other hand, both small grain and corn crops produced much more than a normal yield while the hay crop was only slightly below normal. The immome is therefore materially higher than it would have been with normal yields.

Only farm receipts and expenses directly involved in the operation of the farm are included in these tabulations. All personal items have been excluded. The net income shown is the return the farmer receives for his own labor and management and the use of his capital. No interest has been included in the expense and the entire value of the land and other property held by the farmer has been listed as capital whether mortgaged or not. The interest actually paid on indebtedness varied from nothing to nearly \$1000 per farm.

In computing the farmers capital land has been valued at \$100 per acre and stock, machinery, feeds, etc., at current prices. The decome and expense shown in these statements are not entirely comparable for the two areas. Since the Steele county farms are practically all operated by owners the returns are computed on an owner basis. In Cottonwood and Jackson counties, on the other hand, only 43 per cent of the land is owned by the operators and of the remaining 57 per cent two-thirds is share rented and one-third is rented for wash. The expense and income under the various kinds of tenure have been combined in computing the averages shown. Consequently the incomes are lower by the amount of the share given the landlord than they would be on the owner basis and the expenses less by the costs borne by the landlord.

The farmer's net income for capital and labor in Steele county will allow him 5 per cent on his capital investment and 19 cents per hour or \$57.00 a month for his time. In Cottonwood and Jackson counties after allowing 5 per cent on the investment the farmer would have left 30 cents per hour or \$85.00 per month for his time.

In addition to the average net incomes of \$2014 and \$1660 shown, family labor valued at \$565 and \$353 (computed on the basis of wages paid to hired men) was marketed thru the farm business, thus bringing the family incomes up to \$2579 and \$2013 respectively. In addition to this the farmer had the auto and the farm horses for personal use for his family and himself as all costs of both have been charged as farm expense. The milk, butter, eggs, meat and other farm produce used in the house is credited at the farm price. If credited at the price paid by those who must buy these same commodities at retail the income would be materially incressed.
