INTRODUCTION

The loan activities of commercial banks, particularly in rural areas, are closely interrelated with agricultural operations. These institutions constitute the most important source of personal and collateral credit for farmers. The volume of such credit extended by commercial banks is naturally influenced by variations in agricultural conditions, particularly by changes in farm-commodity prices. At the same time agricultural buying power for industrial goods is influenced by changes in the volume of loans obtained from or repaid to banks.

The marked economic changes that have taken place during the post-war period have greatly influenced the volume of bank credit extended to farmers. As credit changes in recent years have been so drastic it was deemed desirable to appraise, as accurately as possible, the extent to which the volume of outstanding bank credit to farmers had been curtailed. Adequate data for measuring such changes have not been available in the regular reports of the supervisory banking agencies, and a special survey, therefore, was necessary

The author wishes to express his appreciation for the helpful assistance of Fred L. Garlock in planning and supervising the tabulation of the 1934 dat on agricultural leans held by commercial banks and to Mrs. Lucy R. Hudson and Mangaret W. Daniel for supervising the handling and checking of schedules and preparation of tables. Fred L. Garlock, C. D. Jackson, and W. H. Rowe have supplied helpful suggestions in the preparation of the manuscript.

to obtain this information. Through the cooperation of the Federal Deposit Insurance Corporation, the Comptroller of the Currency, and the Federal Reserve Board, schedules requesting data as to specific types of agricultural loans, total loans, and total deposits were enclosed with the call report form for December 31, 1934, sent

out by each of the three cooperating agencies.

These schedules were checked against the report of condition to insure accuracy of comparable items included in both reports. Of the 14,135 banks licensed and insured, 101 failed to submit reports on their agricultural loans, and data on total loans and deposits of each of these banks were obtained from the December 31, 1934, report of condition. The agricultural loans of each of the nonreporting banks were then estimated by multiplying its total loans by the ratios of the various types of agricultural loans to total loans reported by other banks in the same county. In a very few cases, no other banks were located in the same county and ratios for adjoining counties were used. This information permitted the compilation of data representing the most complete and accurate estimate that has ever been made of the outstanding credit advanced to farmers by commercial banks.

As the United States Department of Agriculture had conducted somewhat similar surveys for 5 different years since 1914, these previously compiled data were available for making rough comparisons of changes in the volume of agricultural loans that had occurred between survey dates during that period. The analysis of these changes for the war and post-war periods together with a detailed analysis of the outstanding agricultural loans held by commercial banks at the end of 1934 is summarized on the succeeding pages.

TRENDS IN AGRICULTURAL LOANS HELD BY BANKS

Table 1 summarizes the various estimates made by the Department of Agriculture from 1914 to 1934. The largest amount of agricultural loans held by banks at any time was apparently reached in the latter part of 1920. From 1920 to 1934 loans secured by farm real estate decreased by \$948,641,000 or 66 percent. Personal and collateral loans decreased by \$3,062,278,000 or 79 percent. Both types of loans at the end of 1934 were substantially below the estimated totals for 1914.

¹ Data relate to end of year indicated except for 1914, 1918, and 1931. Data for the latter 2 years relate to the midyear whereas those for 1914 relate to the spring of 1914.

Estimates for individual States were compiled in each survey but variations between estimates on a State basis were influenced to a certain extent by the variations in the proportion of returns received from banks in towns and cities of various population groups. Estimates on a State basis, therefore, are presented only for the 1934 survey. Estimates for previous surveys are presented as totals for

geographic divisions.

The estimates for the surveys prior to that for 1934 were based upon reports of only a portion of the banks, usually from 40 to 50 percent of the total number. The estimates for each State were made on the assumption that the ratio of agricultural loans to total loans and discounts of banks replying to the survey questionnaires were also applicable to the loans and discounts of banks failing to reply. As indicated in a succeeding section of this bulletin, the ratio of agricultural loans to total loans and discounts shows wide variations as between banks in towns and cities of different population groups.

When there is a difference, from one survey to another, in the proportion of loans and discounts reported on schedules from banks in towns and cities of different population groups, this difference tends to alter the State estimate, through changing the ratio of agricultural loans to total loans. For surveys in which a relatively larger proportion of the loans and discounts are reported by banks in towns and cities of the larger population groups the ratio of agricultural loans to total loans will tend to be lower than the true ratio for all banks in the State. Likewise, if a relatively smaller proportion of the returns come from banks in the larger population groups, a ratio derived from the reporting schedules will tend to overestimate the State total of agricultural loans.

It is believed that most of these differences in State estimates tend to be offset when combined into geographic-division totals. In a very few cases, however, the geographic-division totals seem to be out of line and attention is called in the text discussion to such apparent discrepancies. The probability of understatement or overstatement is least in those States in which the volume of agricultural loans is largest because usually there is less variation in the ratio of agricultural loans to the total loans and discounts as between banks

in towns and cities of the various population groups.

PERSONAL AND COLLATERAL LOANS

The volume of personal and collateral loans increased by about 141 percent from 1914 to the end of 1920, an increase corresponding closely to the increase in farm-commodity prices during the same period. The increase in this type of loan from 1914 to 1918 was 56 percent. From 1918 to 1920 there was a further increase of 54 percent despite the fact that there was only a nominal further increase in farm-commodity prices during that period.

After 1920 each of the three succeeding surveys showed a reduction, the sharpest reduction taking place from 1931 to 1934. As undoubtedly there had been an appreciable reduction in agricultural loans between 1929 and the middle of 1931 the reduction in loans that took place during the depression period beginning in 1929 was probably substantially greater than the change indicated for the period from

1931 to 1934.

This reduction following 1929 was much more drastic than that during the period of rapidly declining prices in 1920-21. The period of declining farm-commodity prices following 1929 was about three times as long as the period of declining prices following 1920 and naturally intensified the forces that tended to bring about a reduction in agricultural loans, both by reducing the value of the farmers' collateral for loans and by increasing the number of bank suspensions. As compared with the earlier period bank suspensions were also in substantially greater number following 1929. The facilities of the Var Finance Corporation which were made available to commercial banks in 1921 tended to retard the forced liquidation of agricultural loans in the earlier period. The National Credit Corporation was organized in the fall of 1931 and the Reconstruction Finance Corporation in the spring of 1932 to provide similar financial assistance to banks, but the wave of deposit withdrawals and bank suspensions had gained such momentum that these emergency financing facilities were unavailing in halting the forced contraction of credit.

In analyzing the changes that have taken place in the volume of personal and collateral loans since 1914, on the basis of geographic divisions, it is apparent that the most marked changes in the amount of loans have taken place in the East North Central States and in the West North Central States. These two geographic divisions accounted for about 57 percent of the estimated total of personal and collateral loans held by commercial banks in 1914 and 1920. By 1923 loans in these two groups of States accounted for 61 percent of the total. After 1923 the relatively greater reduction in agricultural loans in these two geographic divisions reduced their proportion, by the end of 1934 to 38 percent of the total. Comparative changes for each of the six surveys are shown graphically, by geographic regions in

figure 1.

From 1914 to 1920 the rate of increase was far from uniform in each of the geographic divisions. The largest percentage increase was shown for the Mountain States and the smallest increase in the New England and Middle Atlantic States. Although only a nominal increase was shown from 1914 to 1918 in the New England and Middle Atlantic States, all geographic divisions showed a rapid expansion in

loans from 1918 to 1920.

From 1920 to 1923 decreases were shown for all geographic divisions with the exception of the New England States. It is possible that the 1923 estimate for the latter group of States, as well as for the Middle Atlantic States, which showed only a slight decrease, was too high. The sharpest decreases were shown in the West South Central and

Mountain States.

In the period from 1923 to 1931, decreases were again shown for all geographic divisions except in the Middle Atlantic States. The 1931 estimate for these States appears to be so divergent from trends in other geographic divisions that the data may represent an overestimate of loans on that date. During this period the reduction in loans held by banks in the West North Central States was particularly large, the amount of such loans being reduced by almost one-half.

In the years from 1931 to 1934 the reduction in loans, which occurred in all geographic divisions, was especially drastic in the East North Central and West North Central States. In these two geographic divisions the outstanding personal and collateral loans to farmers

decreased by about two-thirds in a period of 3½ years. The number of bank suspensions in these States was particularly large and these

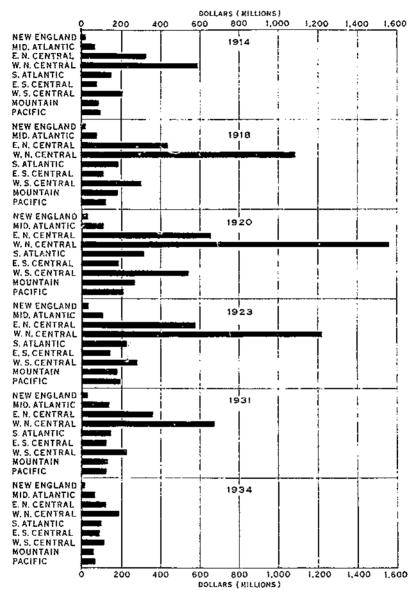

FIGURE 1.—PERSONAL AND COLLATERAL LOANS TO FARMERS.

This figure shows the rapid expansion in the volume of loans in all geographic divisions from 1914 to 1920 and the marked decline that occurred from 1920 to 1931. The large volume of loans shown for the West North Central and East North Central States is accounted for largely by the relatively greater investment utilized in farming operations in these two geographic divisions, as compared with other areas.

numerous suspensions materially influenced the volume of loans. Compared with 1914 the level of loans in all geographic divisions with the exception of the East South Central States was lower in 1934 than in 1914.

LOANS SECURED BY FARM REAL ESTATE

The trend of agricultural loans secured by farm real estate, although roughly similar to that of personal and collateral loans, did not show quite so large an increase from 1914 to 1920 or quite so large a decrease from 1920 to 1934. While farm-land prices were advancing, the amount of farm real estate loans of commercial banks increased at about the same rate. From 1920 to 1923, farm real estate loans decreased only about 4 percent although the index of farm-land values declined from their peak of 170 (1912–14=100) in March 1920 to 130 in March 1924. As the sharp drop in farm income that began in 1920 had impaired the security of many loans that previously had been granted on personal or collateral security, banks followed the policy of strengthening the security back of these slow loans by taking real estate security. Real estate loans acquired in this manner tended to hold up the total volume of such loans despite the active movement of mortgage refinancing undertaken by other agencies during this period.

From 1923 to 1931 the holdings of farm-mortgage loans of commercial banks decreased at a somewhat more rapid rate than the decrease in land values. During most of this period the life insurance companies and the Federal and joint stock land banks were expanding their mortgage loans at a rapid rate and undoubtedly a portion of the mortgage loans held by commercial banks were refinanced by these other agencies. During the same period, there was also a reduction occasioned by the foreclosure of heavily indebted farms. Frequently the foreclosure of a first mortgage held by another agency meant the extinguishment of junior liens taken by commercial banks to strengthen the security of advances previously made when farm-con modity prices

were at a higher level.

With the rapid decline in farm-commodity prices after 1929 the security of many advances made when prices were at a higher level became impaired and commercial banks made some increase in their mortgage loans to strengthen the security of personal and collateral loans previously made. Such increase was slightly more than offset, however, by reductions resulting from other factors, chiefly fore-closures. The annual changes following 1929 may be partially illustrated by the reported holdings of member banks of the Federal Reserve System. At the end of 1929 farm-mortgage loans held by such member banks amounted to \$388,000,000. There was practically no change in 1930, but at the end of 1931 the total had decreased to \$359,000,000 and by the end of 1932 to \$356,000,000.

The sharp reduction in the number of operating banks, following the banking holiday in early 1933, was accompanied by a reduction in the reported holdings of farm-mortgage loans of member banks of the Federal Reserve System. At the end of 1932 such loans were reported at \$356,000,000, as indicated above, and on the following report date, June 30, 1933, at \$318,000,000, a decrease of 11 percent. A part of the reduction taking place between 1931 and 1934 in the total of the estimated farm-mortgage holdings of commercial banks may therefore be attributed to the reduction in the number of operating banks, a reduction which does not take into account the mortgage holdings of closed banks.

The mortgage-refinancing program of the Farm Credit Administration, begun in 1933, has resulted in a substantial reduction in the farm-mortgage holdings of commercial banks. Data covering the period from May 1, 1933, to September 30, 1934, indicate that 16.2 percent of the proceeds of Federal land bank loans and 17.9 percent of the proceeds of Commissioner loans were used to repay first and junior mortgages held by commercial banks. Assuming that these percentages also hold true for the period embracing an additional 3 months, the reduction in farm-mortgage loans held by commercial banks from May 1, 1933, to December 31, 1934, resulting from the refinancing operations of the Farm Credit Administration,

would amount to about \$250,000,000.

During the period 1914 to 1934 the trend of farm-mortgage holdings of State and national banks have shown a marked divergence. Prior to the passage of the Federal Reserve Act, national banks were not permitted to invest their funds in farm-mortgage loans. mated total of mortgage loans held by banks in 1914 therefore represents the holdings of banks other than national. The marked increase in mortgage loans of commercial banks from 1914 to 1920 was largely accounted for by banks other than national, as mortgage holdings of national banks had reached the total of only \$161,652,000 on June 30, 1921. Although the estimated total of mortgage loans of all banks showed a decline at each survey following 1920, loans of this type held by national banks continued to increase until 1928, the holdings of \$325,125,000 on June 30, 1928, being slightly more than twice as large as in 1921. At the end of 1934 farm-mortgage loans of national banks had declined to \$218,268,000, an amount representing 44 percent of the farm-mortgage loans held by all banks.

In tracing the trend of farm-mortgage holdings of commercial banks, by geographic divisions, total holdings, as in the case of personal and collateral loans, are largely dominated by the holdings of banks in the East North Central and West North Central States. In each of the surveys until 1931 mortgage loans in these two geographic divisions represented from 50 to 60 percent of the total held by all commercial banks. In 1934 holdings by banks in these two geographic divisions amounted to only 37 percent of the total farmmortgage holdings of commercial banks, or about the same percentage

as indicated for personal and collateral loans.

In two geographic divisions the volume of farm-mortgage loans has exceeded the volume of personal and collateral loans. In the New England States this situation has prevailed in each of the survey periods. In 1914 the volume of such farm-mortgage loans in the New England States was more than four times as large as the personal and collateral loans, but by 1934 such loans were only slightly more than half again as large as the personal and collateral loans. In the earlier periods New England banks were heavy investors in farm mortgages purchased from other areas, particularly from the Middle West. After 1923 such investments show a sharp reduction as the active lending operations of the Federal and joint stock land banks and the life insurance companies resulted in a considerable refinancing of such loans at lower interest rates. The increased rate of foreclosures of mortgages following the price decline that occurred in 1920–21 was also a factor tending to make eastern

banks less favorably inclined toward the purchase of farm mortgages from other areas.

The practice of commercial banks in purchasing farm mortgages from other areas was not confined solely to the Eastern States but was quite general in many other sections in which local savings were in excess of local requirements, particularly in such sections as southern Wisconsin and northern Illinois. In recent years banks in these areas too have drastically curtailed their investments in outside

mortgages,

In the Pacific Coast States the survey for 1023 was the first to show a volume of farm-mortgage loans larger than the volume of other types of agricultural loans, a relationship which was maintained in each of the two subsequent surveys. The relatively greater increase in farm-mortgage loans in this geographic division is accounted for largely by banks in California where the policies of some of the large branch-banking systems were reflected in a substantial expansion in their portfolio holdings of farm mortgages.

Table 2 summarizes the distribution of farm-mortgage holdings of commercial banks for each of the six surveys, by geographic divisions.

Table 2. - Distribution of loans secured by farm real estate held by commercial banks, et stated dates, by geographic divisions

Geographie division	. Spring of 1914	¹ uly 31, 1	Dec. 31, 1920	Dec. 31, 1923	June 30, 1931	Dec. 31, 1631
	1,000	1,000	1.5tD	1,900	1.04.0	1.f#NO
New England Middle Atlantic East North Central West North Central South Atlantic East South Central West South Central West South Central Mountain Pacific	dollars 84,000 30,000 220,000 216,400 40,500 33,600 27,900 19,500 65,200	dollars 96, 300 58, 787 252, 707 290, 533 53, 129 52, U23 34, 503 27, 621 138, 951	dollarx 19, 685 31, 143 335, 005 531, 212 94, 048 101, 080 73, 251 55, 936 129, 027	dollars 111, 918 37, 510	dollars 36, 529 49, 523 240, 373 212, 117 74, 376 74, 694 62, 089 40, 266 158, 294	dottors 17, 606 42, 214 108, 336 76, 208 43, 526 42, 076 34, 104 13, 117 121, 620

In comparing the changes from one survey to another, it appears possible that the totals for the Middle Atlantic States in 1920, 1923, and 1931 were underestimated. Likewise, it is possible that the totals for the Pacific States in 1918 and 1923 may have been overestimated.

FACTORS INFLUENCING THE TREND OF AGRICULTURAL LOANS HELD BY BANKS

The expansion of agricultural loans from 1914 to 1920 and their contraction subsequent to 1920 were influenced by factors which varied from community to community. The lending policy of local banks, the attitude of farmers relative to the assumption and repayment of debts, climatic conditions, etc., were all influential in accounting for variations in the volume of agricultural leans. varying conditions, however, certain major factors influenced the trend of agricultural loans in practically all agricultural areas. The more important of these were the changes in the level of prices received by farmers, the bank suspensions, the refunding of bank loans into

long-term mortgage obligations, and the development of new Federal financing facilities for farmers. These four major factors are discussed on the following pages.

RELATION OF PRICE LEVEL TO BANK LOANS

Variations in farm-commodity prices, through their influence upon the amount of income received by farmers, have accounted for substantial changes in the volume of agricultural loans held by commercial banks. Figure 2 shows the estimated volume of personal and collateral loans for each of the six surveys conducted by the Department of Agriculture. The index of farm-commodity prices is also shown for the period 1910-35 to indicate the general relationship between farm prices and agricultural loans of commercial banks. It will be noted that loans tend to lag behind the movement of prices.

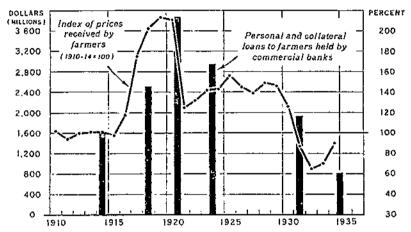

FIGURE 2.—PERSONAL AND COLLATERAL LOANS TO FARMERS, HELD BY COM-MERCIAL BANKS, COMPARED WITH INDEX OF PRICES RECEIVED BY FARMERS.

The trend of personal and collateral loans in the period from 1914 to 1934 has tended to follow the trend of farm-commodity prices. Variations in farm-commodity prices, as they affect the amount of income received by farmers, influence the ability of the latter to repay advances obtained from banks. Price variations also after the value of the collateral that farmers can ofter as security for loans.

Farm-commodity prices, in turn, are an important factor in influencing the trend of farm-land values. Figure 3 shows a comparison of the index of farm-land values and the estimated amount of farm-mortgage loans held by commercial banks at each of the six survey dates.

The rapid rise in farm-commodity prices, following the outbreak of the World War, characterized by an increase in index of such prices from 101 in 1914 (1909-14=100) to a peak of 244 in May 1920, substantially expanded the flow of income into agricultural communities. Deposits at banks increased correspondingly and provided country banks with a mounting excess of claims against urban centers, which was reflected in a substantial increase in the amount of funds carried as balances with correspondent banks. Country banks were naturally desirous of finding profitable investment for their surplus funds and, with the generally favorable agricultural income situation prevailing, advances were freely made to

borrowers. A large part of these advances were of the type which, with the continuation of a high price level, probably could have been repaid within a reasonable period. Following the sharp drop in farm-commodity prices in 1920, when the index declined from a peak of 244 in May 1920 to a low of 113 in June 1921, the ability of farmers to

repay bank loans was seriously curtailed.

The decline in farm-commodity prices resulted in a drastic reduction in the income flowing from urban centers to agricultural communities. The payments which, on the other hand, had to be made from agricultural communities to other areas could not be reduced correspondingly as future commitments had been made for supplies, machinery, interest payments, etc. At the same time, the decrease in farm income in relation to operating and living expenses was so drastic that farm borrowers could make but relatively small reduction on the loans they had contracted on the basis of the previously

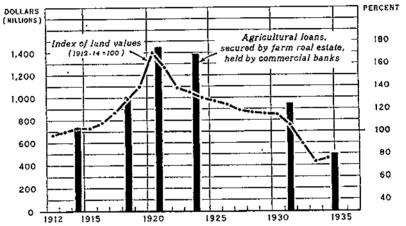

FIGURE 3.—AGRICULTURAL LOANS SECURED BY FARM REAL ESTATE, HELD BY COMMERCIAL BANKS, COMPARED WITH INDEX OF LAND VALUES.

Changes in the amount of farm real estate bans hold by commercial banks in the period from 1914 to 1934 have tended to follow the trend of farm-land values. Indirectly the trend of hand values is influenced by prices received for farm commodities. Immediately following a sharp decline in farm-commodity prices, as following 1929 and 1929, there is a tendency for banks to make some increase in their farm real estate loans to obtain better security for personal and collateral loans made when prices were all a higher level.

existing high level of prices. This situation, in turn, adversely affected

the status of country banks.

Ordinarily the deposits of a country bank constitute a revolving fund from which loans can be made to borrowers within the community. When the assets of this revolving fund consist chiefly of local advances, the country bank's ability to grant new loans, unless the inflow of funds is greater than the volume of payments made outside the community, is dependent upon the rate of repayment of outstanding advances or upon the bank's ability to sell some of its assets or to borrow funds outside the community. The revolving character of the fund thus can be maintained only when the inflow of funds provides additional new deposits or repayments on outstanding advances sufficient to meet the demand for new loans. In those periods when an agricultural community is faced with an adverse balance of payments, and repayments on outstanding advances do

not provide sufficient funds to meet such adverse payments, the solvency of the revolving fund can be maintained only if the individual bank can obtain additional funds through the sele, outside of the community, of a portion of its assets or if it has borrowing power

that can be utilized in obtaining outside credits.

The adverse balance of payments that was encountered by agricultural communities following the sharp drop in farm-commodity prices in 1920 thus seriously impaired the revolving character of the country bank's loan fund and brought about the insolvency of numerous institutions. Most country banks, prior to the price decline, were already heavily indebted to the Federal Reserve banks and to correspondent banks.

The situation faced by farmers and by country banks in this period was summarized in a previous report of the Department of Agricul-

ture as follows: 2

With the collapse in prices of farm products in 1920 and 1921 a credit emergency arose which has few parallels. Banks and other established credit agencies in many sections of the country were unable to cope with the situation and Federal, State, and local governments were called upon to provide emergency funds. In several Northwestern States where crop failures, high operating costs, and the drop in prices of farm products combined to create a serious situation Federal funds in the amount of \$3,500,000 were made available in 1921 and 1922 for the purchase of seed grain. Various county governments in these States also provided farmers with large sums for seed and feed purposes.

The situation in the fall of 1921 became so critical that Congress voted to broaden the powers of the War Finance Corporation to permit advances for agricultural purposes. The War Finance Corporation describes the situation which existed at that time in the following reader.

which existed at that time in the following words:

"When the agricultural credits act was passed (Aug. 24, 1921), there was a state of demoralization everywhere among all classes of agricultural producers. Farmers and stockmen generally were in a desperate plight; breeding herds were being sacrificed on a wholesale scale; immature stock was being sent to the block; and cotton, corn, and other agricultural commodities commanded prices that were discouragingly low, in many cases materially below cost of production. Forced liquidation and hasty selling impaired the farmer's buying power, and this, in turn, brought about a reduced demand for the products of industry. Bank deposits were being withdrawn and reserves depleted, loans could not be collected, and the stability of our whole agricultural and banking structure was seriously threatened."

Under its broadened powers the corporation made between August 24, 1921, and November 30, 1924, advances totaling \$297,934,000. Of this amount 58 per cent was advanced to banking and financial institutions, 29 per cent to livestock loan companies, and 13 per cent to cooperative marketing associations.

* * The influence of the War Finance Corporation in stabilizing credit conditions, however, is not measured solely by the advances it actually made. During these three years it approved loans amounting to almost \$480,000,000. The willingness of the Federal Government to approve large advances for agricultural purposes at a time when the prices of far. products were demoralized helped to restore the confidence of both farmers and bankers and greatly relieved the financial stringency.

To illustrate the readjustment that was forced upon country banks as a result of the drastic decline in farm incomes that began in 1920, data for significant items have been compiled from the reports of country national banks 3 in 10 of the leading agricultural States. These 10 States held more than 50 percent of the estimated total of agricultural loans held by all banks at the end of 1920.

¹⁰¹SEN, N. A.; BRANNEN, C. O.; CADISCH, G. F.; and Newton, R. W. FARM CREDIT, FARM INSURANCE, and FARM TAXATION. U. S. Dept. Agr. Yearbook 1924: 185-284, illus. 1925. See pp. 231-232. The term "country" nutional bank here refers to the classification of the Comptroller of the Currency, that is, national banks outside of contral reserve and reserve cities.

On the basis of call-date data it appears that in the period of credit contraction that began in 1920 deposits of these banks reached their lowest level at the end of 1921. Total deposits decreased approximately 20 percent from May 4, 1920, to December 31, 1921. Changes that took place during this period in the major balance-sheet items are shown in table 3.

Annual reports of the Comptroller of the Currency.

Although deposits decreased 20 percent, loans and discounts decreased only 13 percent. The withdrawal of deposits to meet payments outside of the community necessitated a sharp reduction in balances held with correspondent banks. Holdings of cash and balances with correspondents reached their lowest point on June 30, With the seasonal increase of farm income in the last half of the year, this account was partially restored although at the end of 1921 it was still 25 percent below that of May 4, 1920. The smaller dollar value of check transactions because of lower prices made it possible to carry reduced operating balances but it is probable that the pressure of meeting adverse payments outside of the community caused these balances to be reduced to the barest minimum,

Loans continued to rise from May 4, 1920, to November 15, 1921, but thereafter a reduction was shown for each call date until March 10, 1922, when the trend was reversed. Borrowings increased rapidly from May 4 to December 29, 1920, and decreased slowly in 1921. With the improvement in farm income in 1922, however, a substantial reduction was effected although such borrowings continued at a

relatively high level.

Reduction in holdings of United States securities also provided a source of funds for meeting outside payments. This was in part offset by increased holdings of other securities, largely municipal

investments, warrants, claims, and judgments.

Beginning with July 1921 prices received by farmers began an upward movement which continued until January 1923, the index number of prices advancing from 113 to 146 (pre-war prices=100). The accompanying increase in the flow of agricultural income into agricultural communities again brought about a nominal expansion in deposits which, with the repayments on local loans, provided funds for reducing borrowings at Federal Reserve banks, correspondent banks, and the War Finance Corporation. Balances at correspondent banks were also built up to a more normal level.

During the first half of 1923 prices received by farmers again receded, the index declining from 146 in January to 136 in July. After a recovery in the last half of 1923, due largely to increased prices for cotton and for dairy and poultry products, the index again declined to 137 in May 1924. Prices received by producers of grain and of livestock during this period were relatively low, the annual index number of grain prices being 113 for 1923 and that for meat animals only 107. The relatively less favorable income situation in areas producing these two groups of farm commodities was characterized by unfavorable credit conditions. In order to relieve the acute credit situation that developed in the Northwest during the winter of 1923 and spring of 1924, the life of the War Finance Corporation was extended to December 31, 1924. Despite the wide-spread use of these emergency credit facilities in 1923 and 1924, the number of bank suspensions in the Northwestern States was larger than in any of the previous years of the post-war period.

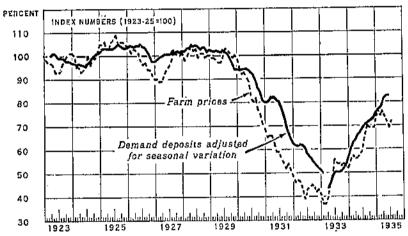

Figure 4.—Prices Received by Farmers and Demand Deposits of Country Banks in 20 States, 1923-35.

The level of not demand deposits of banks in agricultural communities tends to reflect changes in the flow of funds into such communities. Agricultural income is directly influenced by the level of farm-community prices. Recovery in the level of deposits since April 1933 reflects the combined influence of the redposits of currency withdrawn before the banking holiday, reopening of additional banks, and the higher level of farm income resulting from increased farm commodity prices and benefit payments.

With the recovery of farm prices in 1924 farm income was maintained at a relatively stable level until 1930, although in 1926 low prices for cotton tended to reduce agricultural income in the South.

Variations in the flow of funds into agricultural communities during the post-war period have been closely associated with changes in the level of prices received by farmers. Figure 4 shows the index of prices received by farmers compared with an index of net demand deposits of member banks of the Federal Reserve System located in places of less than 15,000 population in 20 of the leading agricultural States. The net demand deposit series, which is corrected for seasonal variation, shows the influence of low farm prices for farm commodities in 1923 and the subsequent recovery of prices in 1924 and 1925. The sharp drop in prices during 1926, largely influenced by low prices for cotton, is also reflected in a lower level of deposits.

The drastic decline in prices received by farmers from 152 in August 1929 to 55 in March 1933 was accompanied by approximately as large a proportionate decrease in net demand deposits. In meeting this unprecedented reduction in deposits, country banks were placed under severe strain and an abnormally large number of bank suspensions took place.

Changes in major balance-sheet items during the period June 29, 1929, and December 31, 1932, the last call date preceding the banking holiday of 1933, illustrate the rapid readjustment that was forced upon the country-banking structure. Table 4 summarizes the calldate data for country national banks in 10 of the leading agricultural

States.

Annual reports of the Comptroller of the Currency,

Total deposits decreased about 40 percent and the decrease of 50 percent in loans and discounts was even larger. It is probable that the greater percentage decrease in loans and discounts was due in part to the large number of bank suspensions during this period. In a period when deposits are declining rapidly, banks that have a high proportion of their assets invested in local loans are less prepared to meet withdrawals through the sale of outside investments. Thus bank suspensions in agricultural regions during this period to a large extent involved banks that had relatively high ratios of loans to deposits. The greater percentage reduction in loans than in deposits would, to this extent, reflect the elimination from the reporting series of those banks having a relatively high ratio of loans to deposits.

Despite the relatively large holdings of securities by this group of banks, there was a reduction of only 25 percent in the United States securities and a reduction of 18 percent in other investments. A very large number of banks had pledged securities to secure various creditors and such investments could not be sold to meet deposit withdrawals. The break in the bond market in the last half of 1931 and first half of 1932 also was so severe that it was not possible for banks to dispose of their bond holdings without incurring substantial losses. The average price of United States bonds declined from 105.3 in June 1931 to 93 in January 1932. Average prices of corporate bonds, as measured by a representative index, declined from 95.4 in July 1931 to 60.6 in June 1932, a decrease of nearly 40 percent.

Balances due from correspondents, as measured by "cash and due from banks", decreased relatively less than deposits. The ratio of such funds to total deposits at the end of 1932 was actually higher than on June 29, 1929. The exceedingly numerous bank suspensions during this period caused most operating banks to follow a policy of protecting themselves against possible abnormal deposit withdrawals by maintaining relatively large balances with correspondents.

Borrowings, which relatively were not large in 1929, showed a slight decrease by the end of 1932. This is in marked contrast with developments accompanying the price decline that began in 1920. In the former period borrowings were very high at the outset of the price decline and continued to rise further for some time thereafter.

During the decade following the 1920 price decline a change in policy had been developing among country banks which resulted in less dependence on outside borrowings in meeting local loan demands. This policy, in turn, curtailed the amount of credit made available to local borrowers. The widespread prevalence of bank suspensions tended to make bankers in many areas unwilling to show any appre-

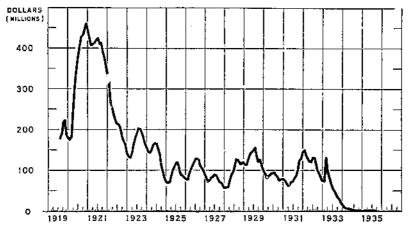

FIGURE 5.—BORROWINGS AT FEDERAL RESERVE BANKS BY COUNTRY BANKS IN FIGHT FEDERAL RESERVE BANK DISTRICTS, LARGELY AGRICULTURAL IN CHARACTER, 1919-35.

The trend of borrowings of country banks after reaching the abnormal high peak of about \$450,000,000 at the end of 1920, has tended to work gradually downward and in 1934 horrowings had been practically eliminated. A characteristic of the series is the marked seasonal movement. This is largely accounted for by the seasonal accommodations extended by the Federal Reserve banks to country banks in the cotton-growing States.

ciable amount of borrowed funds on their published statement of condition except as a last resort in meeting deposit withdrawals. Banks which suspended operations usually had a substantial volume of borrowings prior to closing and the public had come to interpret large borrowings as a sign of weakness, which interpretation led to further deposit withdrawals. This psychological attitude on the part of the public caused country banks to hold down the volume of their borrowings and tended to result in relatively greater pressure for the curtailment of new advances and for the liquidation of outstanding advances.

The trend of borrowings of country banks at the Federal Reserve banks during the period 1919-35 is illustrated in figure 5. This series is based on the reported borrowings from the Federal Reserve banks of banks outside the weekly reporting cities in eight Federal Reserve bank districts, largely agricultural in character. Although this series includes borrowings of banks in small industrial cities outside of the group that report weekly to the Federal Reserve Board, it is composed primarily of borrowings of banks in agricultural areas. It is believed, therefore, that it reflects fairly closely the trend of borrowings of strictly country banks. In addition to borrowings from the Federal Reserve banks, country banks borrowed, during this period, varying amounts from correspondent banks, the War Finance Corporation, and the Reconstruction Finance Corporation.

After reaching the abnormal high peak of about \$450,000,000 at the end of 1920, borrowings of this group of banks tended to work gradually downward until the spring of 1928. The relatively high level of borrowings in 1922 and 1923 was largely accounted for by banks in the livestock and grain-growing areas where farm income was relatively lowest. Income in cotton-growing States had improved sufficiently to enable banks in such areas to make a relatively greater reduction in their borrowings than was true in most other areas.

With the reduction in open-market holdings of securities by the Federal Reserve banks in 1928 and the accompanying increase in open-market interest rates, borrowings increased substantially. With the decline in interest rates that began in the fall of 1929 this temporary increase in borrowings was reduced largely through the liquidation of security loans and other open-market paper that had been acquired earlier.

Unlike the 1920 experience, there was no increase in borrowings following the beginning of the price decline in 1929. It was not until the last half of 1931, when widespread withdrawal of deposits accentuated the wave of bank suspensions, that borrowings showed any substantial increase. Shortly after the beginning of 1932 these borrowings were reduced partly as a result of funds made available through the lending activities of the regional agricultural credit corporations and of the emergency crop-production loan offices. This downward trend continued until just prior to the banking holiday in 1933 when there was a sharp increase. With the restoration of confidence in the banking structure after the banking holiday, the return flow of currency to banks, the higher farm-commodity prices, and the refinancing programs of the Farm Credit Administration provided funds for the repayment of borrowings and by the end of 1934 borrowings from the Federal Reserve banks had been virtually eliminated.

A characteristic of the series shown in figure 5 is the marked seasonal movement shown in the volume of borrowings. This is largely accounted for by the seasonal accommodations extended by the Federal Reserve banks to country banks in the cotton-growing States. Usually the seasonal low point in borrowing is reached in February or March. From this time until August or September, borrowings increase as the adverse balance of payments for the community becomes larger than can be met by the reduction of balances with correspondents or through the sale of outside investments held in the bank's portfolio.

The relationship of the seasonal borrowing of funds by country banks to the annual movement of funds to and from the individual agricultural community may be outlined as follows: With the seasonal marketing of farm products, funds flow into the agricultural community in payment of marketings. The receipt of such funds by

the local bank, as deposits or in payment of loans previously granted for seasonal-production expenditures, provides the bank with claims on urban centers which go to increase its balances with correspondent banks or the Federal Reserve bank. Such increased balances provide funds for the repayment of borrowings and the seasonal trend of such borrowings is to show a decrease until the early part of the following year. During this period balances at correspondent banks also are increased seasonally in anticipation of the adverse community payments that may be expected during the following production season. Commercial paper, brokers' loans, or bonds also are usually acquired during this period for temporary investment during the period when the receipt of outside funds is in excess of the payments that are made to other areas. As marketings decrease, a point is finally reached at which the balance of community payments becomes adverse, a development which is accentuated as the cropproduction season gets under way.

During this period expenditures must be incurred for fertilizer, supplies, and machinery purchased oustide of the community. In meeting these adverse payments, balances at correspondent banks are drawn upon and temporary short-term investments in outside securities are disposed of. These means of meeting the community's outside claims are then supplemented by funds obtained through borrowing at the Federal Reserve bank or from correspondent banks. Borrowings tend to increase until the beginning of the next marketing season when receipts from the new crop again bring about a favorable

balance of payments for the community.

The seasonal movement of funds to and from agricultural communities varies of course as between different areas. The series of country-bank borrowings shown in figure 5 is dominated largely by the borrowings of banks in cotton-growing areas. A community, the income of which is largely dependent upon the marketing of early vegetables, would have an entirely different seasonal movement. Likewise when a community's income is derived largely from live-stock-feeding operations it would have a seasonal movement almost the reverse of that for a community dependent chiefly upon the marketing of crops. Where the flow of income into a community is fairly regular throughout the year, as in a dairying community, there is no appreciable adverse balance of payments of a seasonal character. In such communities there is little or no need for seasonal accommodation from the Federal Reserve banks or from correspondent banks.

REFUNDING OF BANK LOANS INTO LONG-TERM OBLIGATIONS

Following the price decline of 1920 country banks found themselves in possession of a substantial volume of slow or "frozen" loans. This situation caused them to encourage borrowers to seek new mortgage refinancing with other agencies in order to obtain repayment or reduction of such loans. With substantial borrowings from their correspondents and the Federal Reserve banks, the tying up of their assets in such frozen paper impaired the ability of country banks to meet the current loan requirements of their customers. To restore their assets to a more liquid condition, country banks had every incentive to encourage and assist their borrowers to obtain mortgage

loans that would supply funds for making at least a partial reduction

on their bank loans.

As the rapid price rise which culminated in 1920 had taken place in a relatively short period, a substantial volume of the mortgages that had been incurred in years prior to 1919 and 1920 represented amounts lower in relation to the then-existing land values than the maximum loan values set by most leading lending agencies. With the active demand for farm-mortgage loans following 1920, borrowers whose farms had not bitherto been encumbered or whose encumbrance had been incurred when land values were relatively lower were thus in a position to obtain additional funds with which to make payment on their bank loans.

The trend of agricultural loans in the period since 1920, therefore, was materially influenced by the active lending operations of farm-

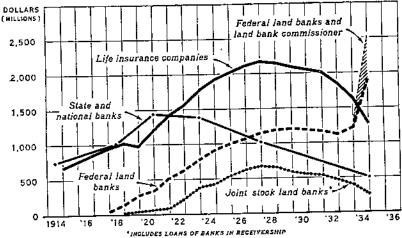

FIGURE 6.—TREND OF FARM-MORTGAGE HOLDINGS OF PRINCIPAL LENDING AGENCIES, 1914-34.

In the post-war period the active lending operations of farm-mortgage credit agencies was a factor influencing the volume of agricultural loans held by commercial banks. In the period from 1920 through 1927, outstanding farm-mortgage loans of life insurance companies, Federal land banks, and joint stock land banks increased in a larger amount than did the total of farm-mortgage indebtedness. In 1934, the operations of the Farm Credit Administration were also an appreciable factor in refinancing agricultural loans held by commercial banks.

mortgage credit agencies. Figure 6, which shows the outstanding farm-mortgage loans of leading lending agencies from 1914 to 1935, indicates the rapid expansion in the volume of loans held by the life insurance companies and by the Federal and joint stock land banks.

Life insurance companies, which held about \$667,000,000 of farm-mortgage loans at the end of 1914, increased their loans up to the end of 1919 at the average annual rate of \$61,000,000. Beginning in 1920 and continuing through 1927 their lending operations were very rapidly expanded, the average annual increase in outstanding loans during this period being about \$149,000,000. From the end of 1919 to the end of 1924, their farm-mortgage holdings practically doubled and placed these institutions in the leading place as a source of farm-mortgage credit. This leading place they held until the rapid

expansion in lending activities of the Farm Credit Administration in 1934.

The lending operations of the life insurance companies have been chiefly concentrated in a relatively small number of States. In 1930, 81 percent of farm-mortgage loans of life insurance companies were concentrated in 10 States. These 10 States, however, accounted for only 36 percent of the total agricultural loans held by commercial

banks on December 31, 1934,

The operations of the Federal land banks in particular served to bring about the refinancing of commercial bank loans as their lending activities were made available to all areas of the country. The lending operations of other leading mortgage-credit agencies had been more largely concentrated in certain favored areas and those sections in which mortgage facilities were not so fully developed had, through the Federal land banks, a new source of mortgage credit for

refinancing purposes.

The Federal land banks, which began operation in 1917, had outstanding loans of \$350,000,000 at the end of 1920. Lending operations from the summer of 1919 to the spring of 1921 were held in check pending the outcome of the suit testing the constitutionality of the Federal Farm Loan Act. Following the Supreme Court's decision upholding the constitutionality of that act, lending operations increased rapidly, the average annual increase in their outstanding loans from the end of 1920 to the end of 1927 amounting to about \$115,000,000. Loans showed a further slight increase in the next 2 years but from the end of 1929 to the end of 1932 there was a decrease of about 7 percent. With the inauguration of the Farm Credit Administration's refinancing program in 1933, authorizing appraisals for land-bank loans on the basis of "normal" values and including provisions for Land Bank Commissioner loans up to 75 percent of the appraised "normal" value, loans from this source had more than doubled by the end of 1934.

The joint stock land banks, the operations of which were also authorized by the Federal Farm Loan Act enacted in 1916, had outstanding only \$78,000,000 of farm-mortgage loans at the end of 1920. As in the case of the Federal land banks, the decision sustaining the constitutionality of the Federal Farm Loan Act in the spring of 1921 was followed by a substantial expansion in lending activities of the joint stock land banks which continued through 1927. The average annual increase in outstanding loans for these institutions from the end of 1920 to the end of 1927 was \$84,000,000. Following 1927 the volume of new loans was curtailed sharply and outstanding loans continued an uninterrupted decline through 1934. These institutions are now in process of orderly liquidation as the provision of the Emergency Farm Mortgage Act of 1933 prohibits them from making new farm-mortgage loans, except incidental to the refinancing of existing loans held by them or to the financing of acquired property. At the end of 1934 joint stock land banks held outstanding loans in

the amount of only \$261,000,000.

During the period when farm-mortgage loan holdings of the life insurance companies and Federal and joint stock land banks were increasing rapidly—from the end of 1920 to the end of 1927—the average annual increase in the volume of outstanding loans of these

three agencies was \$337,000,000, representing a net increase of

\$2,358,000,000 for the period as a whole.

The Department of Agriculture estimated the total farm-mortgage debt to be \$7,858,000,000 on January 1, 1920, and \$9,469,000,000 on January 1, 1928, an increase of \$1,611,000,000. During the same period the actual increase in loans held by the three agencies, whose operations have been discussed above, was \$2,662,000,000, which was substantially in excess of the actual increase in total farm-

mortgage indebtedness.

It is impossible to estimate how much of the mortgage-refunding operations during this period reduced agricultural loans held by commercial banks, but it seems probable that such mortgage refunding was an important factor contributing to reduction of bank loans. The trend of both real estate and of personal and collateral loans of commercial banks was downward during this period. At the end of 1923 it was estimated that about 20 percent of the farm mortgages held by banks represented junior liens, that is, mortgage preceded by one or more mortgages as to priority of security. In 1931 with the total volume of their mortgage loans reduced by nearly one-third, the estimated percentage of junior liens to total farm-mortgage loans held by commercial banks was only about 10 percent. Aithough the reduction of the amount of junior liens was accounted for, in part, by foreclosure of such liens or of the prior mortgages, it is also probable that part of them were refinanced by being consolidated with other debts which were refinanced with long-term mortgage loans.

Data compiled from the applications submitted for loans from the Federal and joint stock land banks show that from their organization to the end of 1927, 66 percent of the proceeds of Federal land bank loans were to be used for repayment of mortgages, and 11 percent for the payment of other debts. In the case of joint stock land banks, 79 percent of the loan proceeds were to be used for repayment of

mortgages and 6 percent for payment of other debts.

In analyzing the refunding of bank loans into long-term farm mortgage obligations in relation to the total indebtedness of farmers, it appears probable that the increase in farm-mortgage indebtedness from the beginning of the price decline in the middle of 1920 to its peak in 1928, was accompanied by little or no net increase in the total agricultural indebtedness. The change in the estimated farmmortonge debt since 1920 was as follows:

January 1, 1920	\$7, 857, 700, 000
January 1 1925	9, 360, 620, 000
January 1, 1928	9, 468, 526, 000
January 1 1930	9, 241, 390, 000

Such evidence as is available indicates that farm-mortgage debt increased rapidly in the first half of 1920, so that the net increase from the middle of 1920, when farm-commodity prices began their sharp decline, to the beginning of 1928 was probably not so large as is indicated by a comparison of the January 1 figures listed above. Such increase as took place was largely if not entirely offset by refunding of bank loans into mortgage loans and by other methods of curtailing agricultural loans obtained from commercial banks.

In the period following 1929 there was little opportunity to refund bank loans into long-term mortgage loans until the Farm Credit Administration began its refinancing program in 1933. Lending agencies drastically curtailed the volume of their new loans from 1929 to 1933 and the continuous decline in land values brought about a corresponding decrease in the value of the security that farmers could

offer as a basis for credit.

Since the beginning of the mortgage-refinancing program of the Farm Credit Administration in 1933, there has been a substantial reduction in the volume of farm mortgages held by all other important lending agencies, including commercial banks. Data covering the period from May 1, 1933, to September 30, 1934, indicate that 22.9 percent of the proceeds of Federal land-bank loans and 24.5 percent of the proceeds of Commissioner loans were used to repay loans held by commercial banks.

BANK SUSPENSIONS

From January 1, 1921, to March 15, 1933, there were 11,265 bank suspensions. Approximately 87 percent of these banks were in places

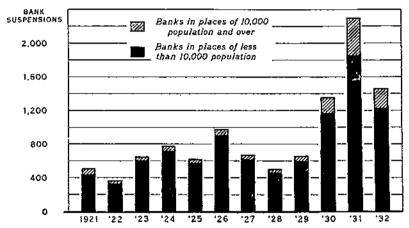

FIGURE 7.—NUMBER OF BANK SUSPENSIONS, BY YEARS, 1921-32, IN PLACES OF LESS THAN 10,000 POPULATION AND IN PLACES OF 10,000 POPULATION AND OVER.

The heavy concentration of bank suspensions in places of less than 10,000 population is explained in part by the fact that such a large percentage of all banks are located in the smaller towns and cities. At the end of 1834, commercial banks located in places of less than 10,000 population constituted 79 percent of the total number of all commercial banks.

of less than 10,000 population and hence banks primarily serving agricultural areas. Bank suspensions in each year for the period 1921-32, together with the proportion representing banks in places

of less than 10,000 population, are shown in figure 7.

Incident to the banking holiday, the number of banks was further drastically curtailed. Between 4,500 and 5,000 banks were not given license immediately after the holiday, and over 2,100 of them were eventually placed in liquidation or receivership. From March 16, 1933, to December 31, 1934, there were also 236 suspensions of licensed banks.

Table 5 shows the number of bank suspensions by States and geographic divisions for each year for the period 1921 to 1934, inclusive. It will be seen that suspensions in the earlier years were most heavily concentrated in the West North Central, South Atlantic, West South Central, and Mountain States. By States, the largest

number of suspensions took place in North Dakota, South Dakota, Minnesota, Nebraska, Montana, Georgia, Texas, and Oklahoma. Following 1929, suspensions became general in nearly all States.

Board of Governors of the Federal Reserve System.
Comptroller of the Currency Report, 1920.

States, was equal to over one-half of the number of banks operating on June 30, 1920. All of the other geographic divisions, with the exception of New England, Middle Atlantic, and Pacific, had very high ratios on a similar comparative basis. By individual States, the highest ratio was 105.7 for Florida. This high ratio is influenced by the fact that the real estate boom in Florida led to the chartering of a substantial number of banks subsequent to 1920. The second highest ratio was 82.7 percent in South Dakota. States having a ratio in excess of 60 percent were as follows: Michigan, Iowa, North Dakota, Nebraska, South Carolina, Georgia, Arkansas, and Nevada.

The suspensions of banks in rural areas were an appreciable factor in reducing the volume of outstanding bank loans to agriculture. When a bank is placed in liquidation, it is obvious that outstanding advances must be quickly collected in order to make payment on the claims of creditors and depositors. Where full collection has not been possible, compromises and the writing-off of assets have also reduced the total of outstanding agricultural loans. Had these banks continued in operation, it is probable that loans on which borrowers could meet interest payments, without reduction of principal, would have continued to be carried as bank assets.

Although many borrowers of good credit standing who had obtained loans from banks that were subsequently suspended were able to obtain accommodation from open banks, the volume of such advances in relation to the volume of loans held by banks at the time of their

closing was probably small.

The numerous bank failures also influenced the volume of new bank loans based on agricultural security by lessening the confidence of depositors of other banks, which led to abnormal deposit withdrawals. To protect themselves against the possibility of such abnormal withdrawals, banks followed the policy of keeping an increasing proportion of their assets invested in readily liquidated securities purchased outside of the community. This policy was not only reflected in a decrease in the proportion of bank assets invested in local agricultural loans but also resulted in pressure for the liquidation of outstanding advances.

FEDERAL FINANCING FOR FARMERS

The decline since 1920 in the volume of personal and collateral loans held by commercial banks was in part offset by the advancing of loans directly by the Federal Government and federally-sponsored agencies. As the availability of loans from the Federal Government or from federally-sponsored agencies diverted a substantial amount of loans from commercial banks, these new lending facilities were a factor influencing the amount of personal and collateral loans held

by commercial banks.

Table 7 summarizes the volume of loans, excluding those secured by farm real estate, held by Federal agencies or by agencies sponsored by the Federal Government at the end of each year during the period 1922-34. The amount of such advances was relatively small until 1930, consisting of seed-loan advances and loans obtained from agencies that discounted with the Federal intermediate credit banks. In observing this table it should be noted that the rediscounts of the Federal intermediate credit banks include rediscounts for production credit associations and regional agricultural credit associations, which are also shown in separate columns.

Farm Credit Administration, Division of Financo and Research.

From 1921 through 1934 Congress by special appropriation or authorization made funds available in 10 different years for direct advances by the Federal Government for the purpose of producing crops or for purchasing feed for livestock. These advances were first known as "seed loans" and later as "emergency crop production loans." The earlier appropriations were available only to limited districts within a very few States and, as indicated in table 7, the amounts involved were relatively small. The availability of such advances until 1932 was predicated upon some climatic disturbance such as drought, storm, or hail.

In 1932 a departure from the previous policy of limiting Federal loans to farmers in those areas which had been affected by an unusual climatic disturbance, such as drought, storm, or hail, was effected. Authority was given to the Secretary of Agriculture to make loans "where he finds that an emergency exists as the result of which farmers are unable to obtain loans for crop production." This latter

policy was also continued in 1933 and 1934.

As an outgrowth of the credit difficulties experienced by agricultural areas following the 1920 price decline, legislation was enacted in 1923 to establish 12 Federal intermediate credit banks. The principal purpose of these institutions was to supply farmers with production and marketing credit for periods longer than those usually supplied by commercial banks. These institutions were not permitted to make direct loans to farmers but were only authorized to discount and purchase agricultural and livestock paper for and from banks, livestock loan companies, agricultural credit corporations, other Federal intermediate credit banks, and various classes of farmers' cooperative associations. They were also authorized to make direct loans to cooperative marketing associations.

Commercial banks made very little use of these rediscounting facilities because discounting institutions were not permitted to charge the borrower a rate in excess of 1½ percent above the discount rate. (This margin was subsequently raised and now stands at 3 percent.) By discounting paper with, or borrowing from, their correspondent banks or the Federal Reserve banks, country banks avoided having to lower their interest rates in accordance with the margin required

by the Federal intermediate credit banks.

The discounts for "other financing institutions" shown in table 7, therefore, represent primarily advances for agricultural credit corporations and livestock loan companies. As indicated in the table, the volume of outstanding loans to financing institutions did not show any great expansion until the production credit associations were established in 1933 and 1934. As the existence of a local discounting institution was required as a channel for the farmer's utilization of the Federal intermediate credit bank facilities, an expansion in lending operations was held in check by the limited number of agricultural credit corporations and livestock loan companies. The narrow margin that was permitted the discounting agencies, particularly in the earlier years of operation, made the investment of capital in local agricultural credit corporations relatively unattractive. Lending operations of agencies discounting agricultural paper with the Federal intermediate credit banks were largely concentrated in the cottongrowing areas and in the livestock-growing sections.

Following the establishment of the Federal Farm Board in 1929, that organization embarked on a program of making loans to cooperative associations which in turn advanced credits to farmer borrowers. With the liquidation of the stabilization loans of the Federal Farm Board, the volume of these loans has tended to decrease substantially. Following the establishment in 1933 of the banks for cooperatives, financing of cooperatives was also shifted to the new institutions. The various types of outstanding loans made from the fund of the

^{*}Some of these loans, chiefly facility loans, represent advances on fixed capital. This situation also prevails in the more recently established banks for cooperatives.

Agricultural Marketing Act, of the Federal Farm Board, are also

shown in table 7.

In 1932, 12 regional agricultural credit corporations were set up by the Reconstruction Finance Corporation to make loans direct to farmers and stockmen where the proceeds of such loans were to be used for an agricultural purpose. The lending operations of these corporations were confined to a relatively short period, from October 1932 to April 1934. Since the latter date, these institutions have been

in process of orderly liquidation.

The first loans of the regional agricultural credit corporations were made in October 1932. In the earlier months of operation, the demand for loans was largely from the livestock areas and, in particular, from the range sections. In the first part of 1933 the volume of crop production loans assumed considerable proportions. Livestock loans as well as all other loans reached a peak in August 1933 when the combined total of all outstanding loans was \$158,394,375. Livestock loans at that time represented slightly less than one-half of the total. During the period from date of organization to December 31, 1934, total loans disbursed, excluding renewals, amounted to \$284,796,430. Renewals during this period amounted to \$103,505,587.

By Executive order of the President dated March 27, 1933, which became effective as of May 27, 1933, the various Federal agencies that provided agricultural credit were transferred to the newly created Farm Credit Administration. This action was shortly followed by the enactment of the Farm Credit Act of 1933 which, in addition to broadening the lending facilities of institutions included under the supervision of the Farm Credit Administration, provided for a permanent system of production credit associations and a system of

cooperative banks.

As indicated earlier, one of the major handicaps in making the facilities of the Federal intermediate credit banks generally available to farmers was the luck of an adequate number of local discounting agencies. The Farm Credit Act of 1933 made provision for the establishment of local discounting agencies known as production credit associations to supply credit for sound agricultural purposes in all agricultural areas. About 560 production credit associations are now in operation and the volume of their loans has shown a rapid expansion, outstanding loans amounting to \$61,024,000 at the end of 1934. With the establishment of the new production credit associations the need for the continued operation of the regional agricultural corporations was removed and since April 30, 1934, the latter have been following an orderly liquidation of their affairs.

Twelve banks for cooperatives and a Central Bank for cooperatives were also established under the provisions of the Farm Credit Act of 1933. The lending operations of these institutions cover somewhat the same field as was hitherto served by the revolving fund of the

Agricultural Marketing Act.

AGRICULTURAL LOANS AND RURAL BUYING POWER

The policies of banks in advancing credits to farmers in the 20-year period from 1914 to 1934 have been characterized by two divergent trends. From 1914 to 1920 the proportion of their total loans advanced to agriculture increased, indicating that the buying power of

agriculture, as an industry, was relatively more rapidly augmented by bank loans than was that of other industries considered as a whole. Since 1920, each of the three bank surveys has indicated a decrease both in the absolute amount of agricultural loans and in the proportion which such advances bear to total loans of banks. Table 8 indicates the changes that have taken place since 1914.

Table 8.—Relation of agricultural loans to total loans held by banks in stated years

¹ Annual reports of Federal Reserve Board; includes national banks, State commercial banks and trust companies, mutual and stock savings banks, and all private and industrial banks included in abstracts issued by State banking departments.

At the end of 1934 the ratio of agricultural loans to total loans held by banks was the lowest shown in the six surveys, being only about one-third as high as the ratio indicated for 1920.

A part of the decline in the ratio of agricultural loans to total loans of all banks may be explained by developments that did not curtail the buying power of agriculture. Since 1920 a part of the reduction in agricultural loans held by banks has been accounted for by a refunding of such advances into long-term mortgage loans obtained from sources other than commercial banks, by writing-off uncollectible loans, and, in recent years, by a shift in new financing to Federal and federally-sponsored agencies.

The estimates indicate, however, a substantial reduction in agricultural loans of banks, accounted for by factors other than those listed above, which together with the loss of purchasing power resulting from the immobilized deposits of suspended banks in agricultural areas, influenced the demand of agriculture for the output of other industries.

The decline in the absolute amount of agricultural loans during a period in which, for the most part, total loans of all banks and national income were both increasing, indicates that farmers' incomes as a direct factor in the demand for the output of other industries were relatively reduced by such net repayments on indebtedness and the immobilization of deposits in closed banks. Seasonal changes in the volume of agricultural loans, resulting from the seasonal borrowing and repayment of funds varying in proportion to changes in farm income, do not result in any relative change in the buying power of farmers. When loans to farmers increase more rapidly than farm income, however, the buying power of farmers is relatively augmented. Likewise, if the level of agricultural loans is reduced when farm income is increasing or is reduced relatively more when income is declining, the buying power of farmers is relatively curtailed. In

the period prior to 1920, it appears that in many agricultural areas farm buying power was augmented by the bank-loan policy and that in the period since 1920 it has been relatively curtailed.

CLASSIFICATION OF AGRICULTURAL LOANS HELD ON DECEMBER 31, 1934, BY TYPE OF SECURITY

Turning from an analysis of the developments influencing the volume of agricultural loans held by commercial banks during the war and post-war period, an analysis of the agricultural loans held by commercial banks on December 31, 1934, is presented. This analysis is based on a classification of loans by type of security and also classifies the volume of agricultural loans held by banks in towns and cities of various population groups. A distribution of agricultural loans by type of bank is also presented.

TYPE OF SECURITY

Of the agricultural loans held by commercial banks on December 31, 1934, 38.2 percent consisted of loans on farm real estate; 8 percent of loans secured by livestock only; 12.2 percent of loans secured by crops, equipment, and livestock; 11.1 percent of loans secured by warehouse receipts; 4 percent of loans secured by other collateral; and 26.5 percent of loans not secured by collateral, including both endorsed and unendorsed notes. Table 9 shows the distribution of agricultural loans of the various types reported by commercial banks, by States and geographic divisions.

Agricultural loans constituted only 9 percent of total loans of commercial banks on December 31, 1934. Excepting for the New England and Middle Atlantic States, which together hold 52 percent of all commercial bank loans, all other geographic divisions had a higher ratio of agricultural loans to total loans than the ratio for the United States as a whole. The highest ratio of 39.1 percent is found in the Mountain States; the next highest in the West North Central States. Banks in the East and in the West South Central States have approximately one-fourth of their total loans classified as

agricultural. Table 10 shows total loans, total agricultural loans, and the ratio of agricultural loans to total loans by geographic divisions.

Table 10.—Total loans and total agricultural loans together with ratio of total agricultural loans to total loans, by geographic divisions, Dec. 31, 1934

In general, the proportion of the total agricultural loans held in various geographic divisions, corresponds closely with both the distribution of the total agricultural income and the value of farms in such geographic divisions. This is indicated in table 11.

Preliminary report of the Bureau of the Census.
 This total differs from estimated United States cash income because it includes only income from selected commodities and no deductions are made for the inshipment of livestock for feeding.

LOANS SECURED BY FARM REAL ESTATE

Loans secured by farm real estate represented 38.2 percent of total agricultural loans. This type of loan was heavily concentrated in the Pacific, East North Central, and West North Central States, these three geographic divisions having slightly more than 60 percent of the total. The largest amount in any one State was \$115,563,000 in California. This amount, which represented 23.2 percent of all farm real estate loans held by commercial banks in the United States, was primarily concentrated in the large branch-banking systems of that State. Table 12 shows the amount and percentage distribution of real estate loans of commercial banks by geographic divisions.

Table 12.—Distribution of loans secured by farm real estate, by geographic divisions
Dec. 31, 1984

Geographic division	Loans se- cured by farm real estate	Percontage of United States total	Geographic division	Louns se- cured by furth real estate	Percent- age of United States total
New England Middle Atlantic East North Central West North Central South Atlantic East South Central	1,000 dollars 17,600 42,214 108,336 76,258 43,520 42,077	Percent 3, 5 8, 5 21, 7 15, 3 8, 7 8, 4	West South Central Mountain Pacific United States	1,000 dollars 34, 194 13, 117 121, 520 498, 842	Percent 6, 9 2, 0 24, 4 100, 0

The highest ratio of farm real estate loans to total agricultural loans for any geographic division, 64.9 percent, was shown for the Pacific States and the lowest, 18.3 percent, for the Mountain States. Relatively high ratios were also shown for the Middle Atlantic and East North Central States. The highest ratio for any individual State was that of Vermont where 78 percent of total agricultural loans were represented by loans on farm real estate, in large part loans on farms in other States. California also had a high ratio of 70.7 percent, resulting from the policy of the larger branch banks of having a substantial amount of their assets invested in this type of loan. In the Southern States only Louisiana and Mississippi had farm real estate loans in excess of 50 percent of their total agricultural loans.

The decline in the volume of loans secured by farm real estate from \$1,447,483,000 at the end of 1920, to \$498,842,000 at the end of 1934, was less rapid than for all other types of agricultural advances. This probably was due largely to the fact that a part of the farmmortgage loans of commercial banks is not acquired directly as an investment but is acquired as security for an advance previously made. In a period of declining prices such as was experienced in 1920-21 and following 1929, the security for many loans, made when prices were higher, becomes impaired. In order to protect their advances, therefore, banks frequently obtain real estate mortgage security.

LOANS SECURED BY LIVESTOCK

Banks were requested to report their loans based on livestock security in two categories, those secured by livestock only and those secured by "crops, equipment, and livestock." The total amount of loans of the first type was \$104,153,000 and of the second type \$159,785,000. Loans of the latter type which also include loans for crop-production purposes were abnormally low because the seasonal accommodations for this purpose are usually repaid by the end of the year. If data had been obtained for the midyear, the total for this item undoubtedly would have been much higher. The amount and percentage distribution of these loans, by geographic divisions is shown in table 13.

Table 13.—Distribution of loans secured in whole or in part by livestock, by geographic divisions Dec. 31, 1984

The distribution of livestock loans follows in a general way the distribution of livestock numbers, being relatively largest in the West North Central, West South Central, and Mountain States. The Pacific Coast States also held a considerable volume of such loans, chiefly in California. Of the individual States, the largest volume was held by Texas with 18.4 percent of the United States total of loans secured solely by livestock and with 11.9 percent of the United States total of loans based in part on livestock security. Nebraska and Minnesota had the next largest volume, and Kansas, California, Oklahoma, and Iowa also had relatively large amounts of loans based on livestock security.

The volume of livestock loans held by commercial banks has been substantially reduced by the same factor that has influenced other types of agricultural loans, namely, the sharp decline in prices of farm commodities. The drastic decline in livestock prices from 1930 to 1932 necessitated a reduction in outstanding loans as a readjustment to the lower value of the livestock security, and, at the same time, curtailed the value of the security that farmers could offer for loans. Severe drought conditions in livestock areas, particularly in 1934, also brought about a considerable liquidation of loans through the reduction in livestock numbers. Losses encountered in feeding operations immediately prior to 1933 were a factor tending to make feeders curtail their operations. Lack of adequate feed supplies in many of the important cattle-feeding States also reduced the demand for feeder loans in the winter of 1934–35.

In addition to these factors affecting the volume of livestock loans held by commercial banks, there has been a shifting of this type of loan to other agencies, which has further influenced the reductions of such loans in the hands of commercial banks. Prior to 1920 livestock loan companies, making loans to livestock growers and feeders and selling their paper to banks throughout the country, were important factors in the field of livestock financing. The sharp drop in livestock prices that began in 1920 brought about heavy losses to these companies and many became insolvent and were liquidated. By the end of 1929 only a few of these companies remained and at the present time the livestock loan company which

operates on the basis of selling livestock paper to commercial banks

has virtually disappeared.

Following the passage of the Agricultural Credits Act of 1923 permanent agencies for the rediscounting of livestock loans, as well as for other types of agricultural paper, were provided in the establishment of the Federal intermediate credit banks. Some of the previously existing livestock loan companies began to use this new source of funds with which to continue their loan operations, and additional loan companies and agricultural credit corporations were organized. At the end of 1932 Federal intermediate credit banks were rediscounting about \$59,000,000 of livestock loans as compared with about \$35,000,000 at the end of 1929.

The establishment of the regional agricultural credit corporations in 1932 opened up another source of credit to livestock growers which resulted in a considerable shifting from banks of loans secured by livestock. The largest volume of outstanding livestock loans held by these corporations was \$78,223,000, reached in August 1933. In the same month they also held agricultural loans, a considerable proportion of which was in part secured by livestock, in the amount

of \$80,171,000.

Under the system of local production credit associations, set up under the supervision of the Farm Credit Administration in 1933 and 1934, loan operations have expanded rapidly and at the end of 1934 these associations had \$32,855,000 of livestock loans outstanding. This amount includes a portion of the loans previously financed by the regional agricultural corporations.

At the end of 1934 the various agencies operating under the supervision of the Farm Credit Administration had outstanding livestock

loans in the following amounts:

Regional agricultural credit corporations \$50, 379, 000
Federal intermediate credit banks:

Discounted for production credit associations 32, 855, 000
Discounted for other financing institutions 44, 514, 000

The growth in the volume of livestock loans by these federally-sponsored institutions explains, in part, the relatively low level of

livestock loans held by commercial banks at the end of 1934.

Commercial banks located in the leading livestock-marketing centers have usually played an important part in the financing of livestock, particularly in connection with the purchase of cattle for feeding. In most stockyard centers one or more banks have specialized in livestock loans, either in making loans directly to livestock growers and feeders or in rediscounting loans for livestock-commission firms.

To ascertain the relative importance of loans granted by banks in stockyard centers, a special tabulation was made of the livestock loans reported by banks in, or adjacent to, the 17 most important livestock markets.⁵ The amount of loans secured by livestock only, held by banks in these 17 centers on December 31, 1934, was \$18,764,500, or 28.4 percent of their total agricultural loans. The amount of their loans secured by crops, equipment, and livestock, was \$5,274,400 or 8 percent of their total agricultural loans.

¹ Chicago, Kansas City, Mo., St. Louis (including East St. Louis), St. Paul (including South St. Paul), Omaha, St. Joseph (including South St. Joseph), Sloux City, Oklahoma City, Denver, El Paso, Sult Lake City, Los Angeles, Portland, Oreg., Fort Worth, Indianapolis, Louisville, and Wichita.

In comparison with the total loans in these two classifications held by all banks in the United States, banks in these 17 centers held 18 percent of all loans secured by livestock only, and 3.3 percent of the total of loans secured by crops, equipment, and livestock.

LOANS SECURED BY WAREHOUSE RECEIPTS, BILLS OF LADING, ETC.

Loans secured by warehouse receipts, bills of lading, etc., constitute 11.1 percent of total agricultural loans and 17.9 percent of personal and collateral loans. Except in the southern cotton States, the amount of such loans, in comparison with other types of agricultural loans was relatively small. As indicated in table 14, 86 percent of the United States total were concentrated in the South Atlantic, East South Central, and West South Central States.

Table 14.—Distribution of loans secured by warehouse receipts, bills of lading, etc., by geographic divisions Dec. 31, 1934

In the cotton-growing States, loans of this category were substantially expanded as a result of the commodity-loan plan formulated in connection with adjustment or marketing programs of the Agricultural Adjustment Administration. Under this plan, the Commodity Credit Corporation 6 stood ready to purchase loans based on designated commodities, when such loans had been made on the prescribed form of note and when tendered on or before a specified date, usually 30 days prior to the note's maturity date. The rate of interest on these loans was 4 percent.

With the availability of this loan plan, eligible producers in the Southern States were able to obtain loans on cotton and on gum turpentine in the amount specified under the corporation's loan plan. The notes could then be forwarded to the Commodity Credit Corporation for disbursement of the loan proceeds, or local banks or other agencies could make disbursement of the loan proceeds and hold the note with a repurchase agreement by the Commodity Credit Corporation. As the interest rate of 4 percent on these loans was substantially higher than the rate of return on other short-term liquid paper, local banks exercised their privilege of holding these commodity loans in their portfolios.

^{*}This corporation was authorized by the President's Executive Order of Oct. 16, 1933. It was organized under the laws of the State of Delaware on Oct. 17, 1933, its entire capital stock being subscribed by the Secretary of Agriculture and the Governor of the Farm Credit Administration for and on behalf of the United States. 'The funds for the \$3,000,000 capital stock were obtained by the President's allocation of that sum from the \$100,000,000 appropriation authorized by section 220 of the National Industrial Recovery Act and by the Fourth Deficiency Act of the fixed year 1933, approved June 16. Additional funds for carrying on its loan operations have been obtained from the Reconstruction Finance Corporation.

Loans on cotton during the 1934 marketing season were made on the basis of 12 cents per pound for cotton that was Low Middling in grade and seven-eighths of an inch or better in staple, and 11 cents per pound on such grade of cotton with staple below seven-eighths of an inch. As of December 31, 1934, it was reported that loans in the amount of \$207,902,000 were held by banks and other lending institutions.7

Loans on gum turpentine and gum rosin during 1934 were made on the basis of \$50 per unit with a deduction of \$10 per unit for carrying charges. The loan limits were later raised (Sept. 6, 1934) to \$50 per unit with no deduction for carrying charges. As of December 31, 1934, it was reported that banks and other lending agencies (exclusive of loans held directly by the Commodity Credit Corporation) held loans of this character in the amount of \$2,457,000.8 Commodity Credit Corporation loans on gum turpentine and gum rosin, held by commercial banks, were chiefly concentrated in Florida, Georgia, and South Carolina.

Loans on corn in 1934 were made on the basis of 55 cents per bushel. Owing to the short crop in that year, corn prices were relatively high and farmers did not make nearly as extensive use of this loan plan as in the preceding year. As of December 31, 1934, it was reported that banks and other lending agencies (exclusive of the Commodity Credit Corporation) held loans secured by corn in the amount of \$6,026,000.8

It is probable that the total amount of loans secured by warehouse receipts, bills of lading, etc., as reported by commercial banks, is somewhat understated. Examination of the schedules from banks in cotton-growing States indicated that many banks, chiefly nonmember State banks, failed to classify their Commodity Credit Corporation loans under this group classification.

LOANS ON OTHER COLLATERAL

The proportion of loans secured by collateral, of a type other than that discussed above, totaled only 4 percent of total agricultural loans. The highest proportion of such loans to total agricultural loans was found in the Middle Atlantic and New England States—table 15.

Table 15 .- Distribution of loans secured by other collateral, by geographic divisions Dec. 31, 1034

^{*} United States Department of Agriculture, Agricultural Adjustment Administration. CULTURAL ADJUSTMENT IN 1634. A REPORT OF ADMINISTRATION OF THE AGRICULTURAL ADJUSTMENT ACT FEBRUARY 15, 1634 TO DECEMBER 31, 1634. 450 pm., Ilius. 1635. See p. 215.

1 UNITED STATES DEPARTMENT OF AGRICULTURE, AGRICULTURAL ADJUSTMENT ADMINISTRATION. See

p. 217 of reference cited in footnote 7.

Previous surveys have indicated that "other" collateral has been represented in large part by stocks and bonds, the proportion being 69 percent in 1920, 45 percent in 1923, and 53 percent in 1931. The use of stocks and bonds as security for agricultural advances has been more prevalent in the New England and Middle Atlantic States than in other geographic divisions.

UNSECURED LOANS

The practice of making loans to farmers on the basis of a promissory note without security other than endorsement is most prevalent in the northeastern section of the United States. In the Middle Atlantic States 49 percent of all agricultural loans were of this type. The lowest proportion of unsecured loans of any of the geographic divisions was in the West South Central States where only 10.6 percent of all agricultural loans were of this type.

Unsecured loans constituted 26.5 percent of total agricultural loans held by banks. By geographic divisions the largest amounts were concentrated in the Middle Atlantic, East North Central, and West North Central. Distribution of this type of loan, by geographic

divisions is shown in table 16.

Table 16.—Distribution of toans not secured by collateral, by geographic divisions Dec. 31, 1934

Geographic division	Loans not secured by collecteral	Percentage of United States total	Geographic division	Loans not secured by collateral	Percentage of United States total
New England		Percent 2. 3 15 1 26. 3 20. 0 1 10. 7 9. 7	West South Central Mountain Pacific	1,609 dollars 15, 442 10, 323 29, 215 340, 339	Percent 4.5 3.0 8.4 100.0

Although information as to the proportion of unsecured loans represented by notes with one or more endorsements was not obtained in 1934, data from previous surveys indicate that in 1920, 52.9 percent of such loans were made without endorsement, 49.6 percent in 1923, and 58.8 percent in 1931.

AGRICULTURAL LOANS HELD BY BANKS IN TOWNS AND CITIES OF VARIOUS POPULATION GROUPS

As the country banks form the main source of short-term credit for farmers, it is of interest to indicate the amount of agricultural loans held by banks in towns and cities in various population groups. Such a classification of loans tends to show clearly the extent to which commercial bank loans to agriculture are concentrated in banks in the smaller towns and cities.

Table 17 shows a distribution of agricultural loans of commercial banks in the United States, the towns and cities in which such banks are located having been classified in 11 different population groups.

Table 17.—Amount of agricultural loans held by banks in towns and cities of various population groups, Dec. 31, 1934

The classification in table 17 tends to understate the proportion of agricultural loans held by banks in smaller places because the loans of branch-banking systems are reported from the head office. If it had been possible to obtain reports from each branch and to classify its agricultural loans in the population group to which such branch bank belongs, the proportion of loans held by banks in smaller places would have been increased. The large percentage of real estate loans held by banks in places having a population of 500,000 and over is largely accounted for by the reports of branch-banking systems.

Table 18, showing the percentage distribution of agricultural loans by population groups, shows that 50 percent of the personal and collateral loans to farmers were held by banks in places of less than

2,500 population. Taking all banks in places of less than 15,000 population, this group of banks held 65 percent of the loans secured by farm real estate, 80 percent of the personal and collateral loans to farmers, and 74 percent of all agricultural loans. As the size of the population group increases the percentage of total agricultural loans held in each group decreases, with the exception of the last group, to which reference has already been made.

Not only do banks in the smaller places have a larger proportion of the total agricultural loans but they also have a higher percentage of their total loans represented by agricultural advances. The ratio of agricultural loans to total loans in the various population groups

was as follows:

Population:	Percent	Population—Continued.	Percent
Population: Under 1,000	49.9	25,000 to 49,999	7. 0
1,000 to 2,499	43. 1	50,000 to 99,999	
2,500 to 4,999		100,000 to 249,999	
5,000 to 9,999	19. 9	250,000 to 499,999	2. 7
10,000 to 14,999	14. 9		
15,000 to 24,999	9.8	All banks	9.0

Considerable variation is shown, as between geographic divisions, in the percentage of agricultural loans to total loans held by banks in the same population groups. In the West North Central States, banks located in places of less than 1,000 population had 76.3 percent of their total loans represented by agricultural advances. Middle Atlantic States the percentage in the same population group was only 14.5 percent and in the New England States 17.1 percent. In the New England and Middle Atlantic States the highest percentage of agricultural loans to total loans is found in banks located in places of 1,000 to 2,499 population. In all of the other geographic divisions the highest percentage is found in the population group representing places of less than 1,000. The Mountain States show a relatively higher percentage of agricultural loans in the higher population groups than do other geographic divisions, chiefly because of the financing of the livestock industry. The large-scale operations of range-livestock growers frequently involve financing on a scale that cannot be handled by the smaller institutions, hence these larger loans tend to be financed by banks in the larger cities. In the West South Central, East South Central, and the South Atlantic States, the percentage of agricultural loans held by banks in the larger population groups is influenced by holdings of Commodity Credit Corporation loans on warehoused cotton.

Table 19 shows the variations in the proportion of agricultural loans to total loans, by population groups, for each of the geographic

divisions.

AGRICULTURAL LOANS CLASSIFIED BY TYPE OF BANK

As reports covering all commercial banks were received by three different supervisory agencies, a classification was made to indicate the differences between the three types of banks. These types were: Nonmember State banks reporting to the Federal Deposit Insurance

Corporation, State banks that were members of the Federal Reserve System reporting to the Federal Reserve Board, and national banks reporting to the Comptroller of the Currency.

Of the three types of banks, national banks held the largest proportion of all the agricultural loans, having 48.4 percent of the total. Nonmember State banks held 43.8 percent and State member banks held 7.8 percent of all agricultural loans. Table 21 shows a classification of agricultural loans by States for each type of bank.

On the basis of the percentage of agricultural loans to total loans, nonmember State banks have the highest proportion of their total loans represented by agricultural advances. Such advances represented 22.7 percent of total loans for nonmember State banks, 2.3 percent for member State banks, and 8.5 percent for national banks.

The materially higher proportion of agricultural loans to total loans shown for nonmember State banks is largely accounted for by the heavy concentration of this type of bank in the smaller places. Seventy-one percent of all nonmember State banks were located in places of less than 2,500 population, as compared with 35.7 percent of all member State banks and 43.3 percent of all national banks. Table 22 showing the percentage distribution of the number of banks in various population groups, indicates the extent to which there is a relatively greater concentration of nonmember State banks in the smaller places.
