The state-contingent model

- ~ First developed by Arrow and Debreu
- ~ A consistent approach to product differentiation by:
 - ~ quality
 - ~ spatial location
 - ~ time
 - ~ state of nature
- ~ General equilibrium and missing markets

The case for the state-contingent approach

- ~ Analogy between state-contingent production and choice under uncertainty
- ~ Stochastic production functions as a special case
- ~ Consistency with general equilibrium and finance theory
- ~ Structural forms and reduced forms
- ~ Applicability of modern production theory

Production and choice

- ~ Risk premiums and production premiums
- ~ Homotheticity and constant risk aversion
 - ~ Absolute and relative
- ~ Flexibility and risk aversion

Stochastic production functions

- A restrictive special case
- No substitution between states of nature

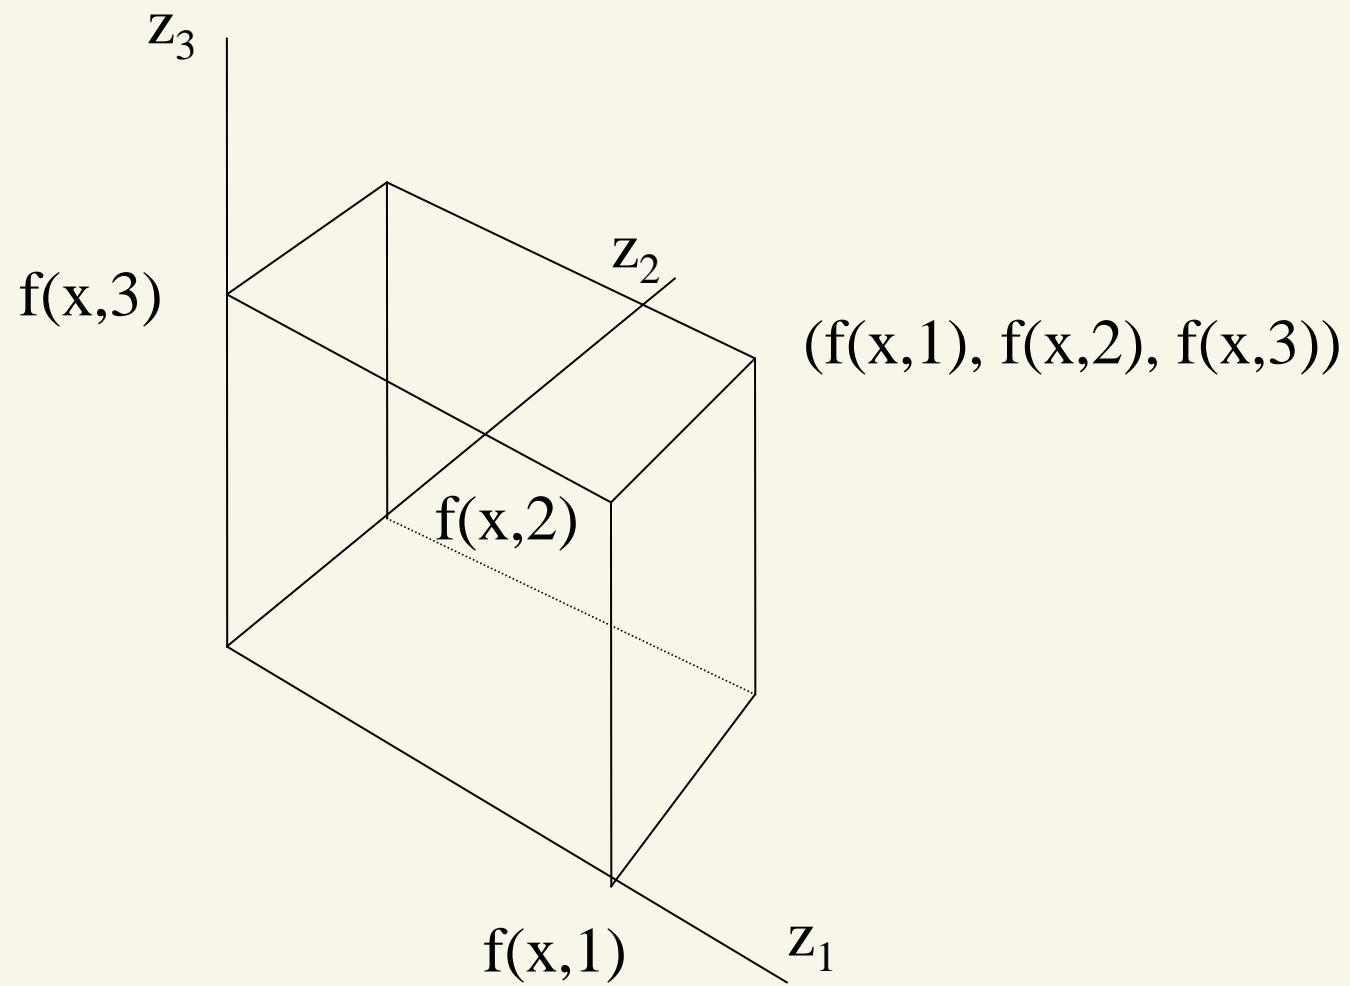

Figure 2: Stochastic production $S=2$
Output Cubical Output Set

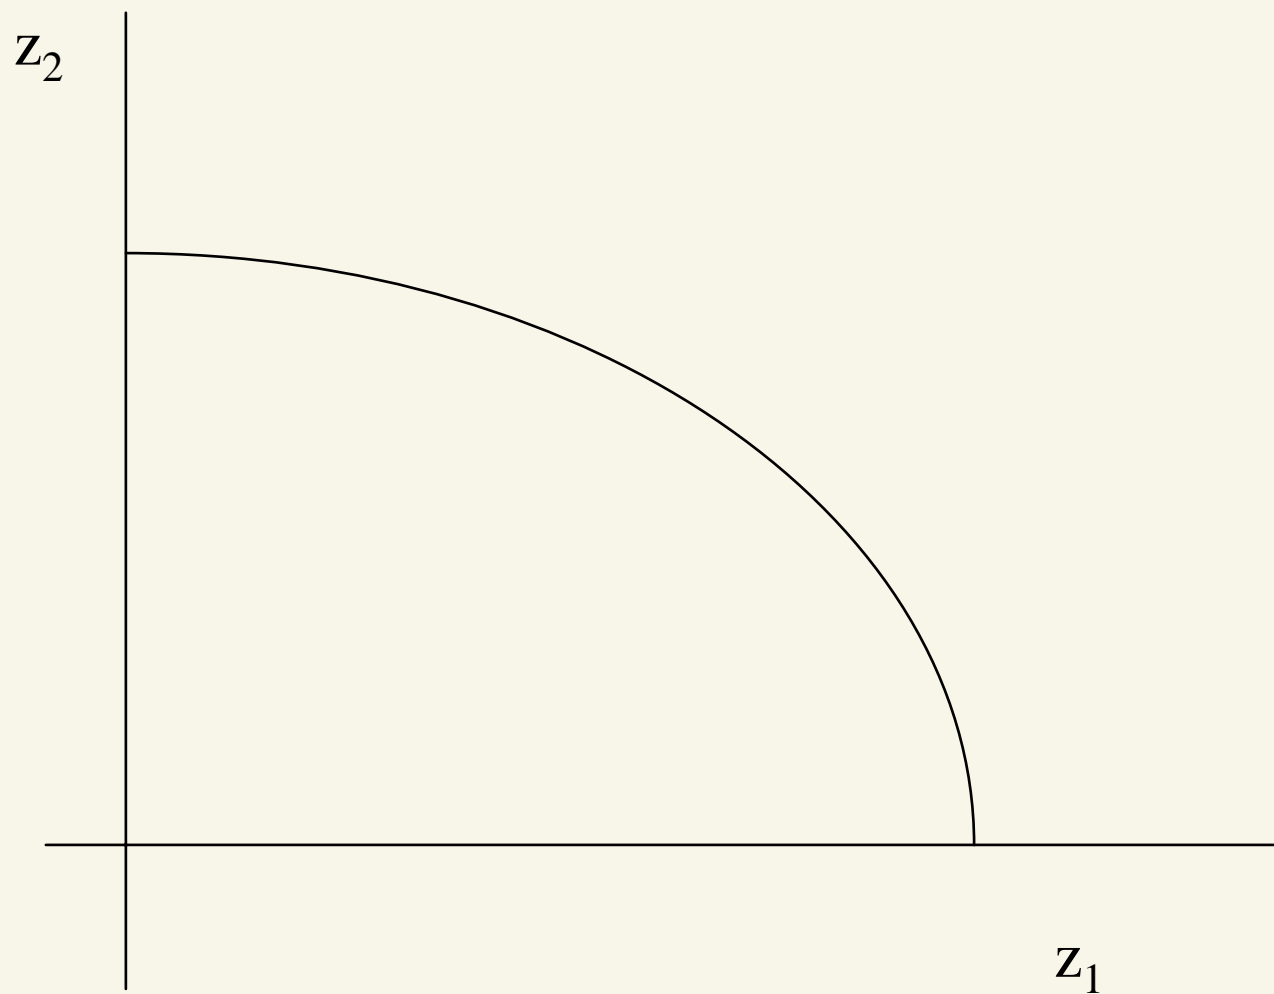

Figure 3: A smooth state-contingent product transformation curve

GE and finance theory

- ~ Original focus of Arrow and Debreu
- ~ Integrating production and finance decisions
- ~ Incorporating moral hazard

Structural forms and reduced forms

- ~ Parametrized distribution function is a reduced form
- ~ State-contingent representation is a structural form

Modern production theory

- ~ Duality
 - ~ Difficult to apply under uncertainty using existing representations
- ~ Convex sets
- ~ Distance and translation functions
- ~ All applicable in state-contingent framework

Policy applications

- Drought policy
- Contract design
- Price stabilisation

Drought policy

- Need to model drought preparation
- Stochastic production function model doesn't accommodate this
- Risk-reducing and risk-increasing policies

Contract design

- Problem is trivial with SPF technology
 - Output in one state determines output in every other state
 - Principal can get first best by ensuring minimum output
- State-contingent model gives a more realistic analysis

Price stabilisation

- Literature begins with a paradox
 - Waugh- price instability good for consumers
 - Oi - price instability good for producers
- Problem of interpreting supply and demand curves under uncertainty
- State-independent supply curves
 - Generalised Oi result

Empirical applications

- . Efficiency estimation
 - . Griffiths and O'Donnell
- . Stochastic productivity indicators
 - . Chambers analyses US aggregate data
- . Asset pricing
- . Simulation modelling
 - . Murray-Darling Basin

The state-contingent approach

- The best way to think about all problems in the economics of uncertainty, including problems of consumer choice, the theory of the firm and principal--agent relationships.
