J. P. HERTEL

E. M. HUGHES

P. A. HENDERSON

E. W. CAKE

Farm Cost-Account Project

Annual Report for 1935

History: Project started in 1913, and has been conducted continuously for twenty-three years.

Objects:

- a. To provide standards of comparisons useful in the analysis of a farm business (pounds of milk per cow, time spent per 100 hens, etc.).
- b. To determine the relative profitability of important farm enterprises.
- c. To indicate some of the farm management practices that have proved successful.

Procedure: Each farmer who cooperates in the project

- a. takes a complete inventory at beginning and end of year.
- b. keeps a daily record of receipts and expenses.
- c. keeps a daily record of time spent and equipment used on each enterprise.
- d. keeps various field, production and feed records.

A representative of the Farm Management Department spends from one to three days at the farm at the end of the year to help the farmer check the records for accuracy and completeness.

The clerical work of closing and analyzing the books is done at the College.

Not typical: The farms are not typical of New York State, but are larger and more productive than average.

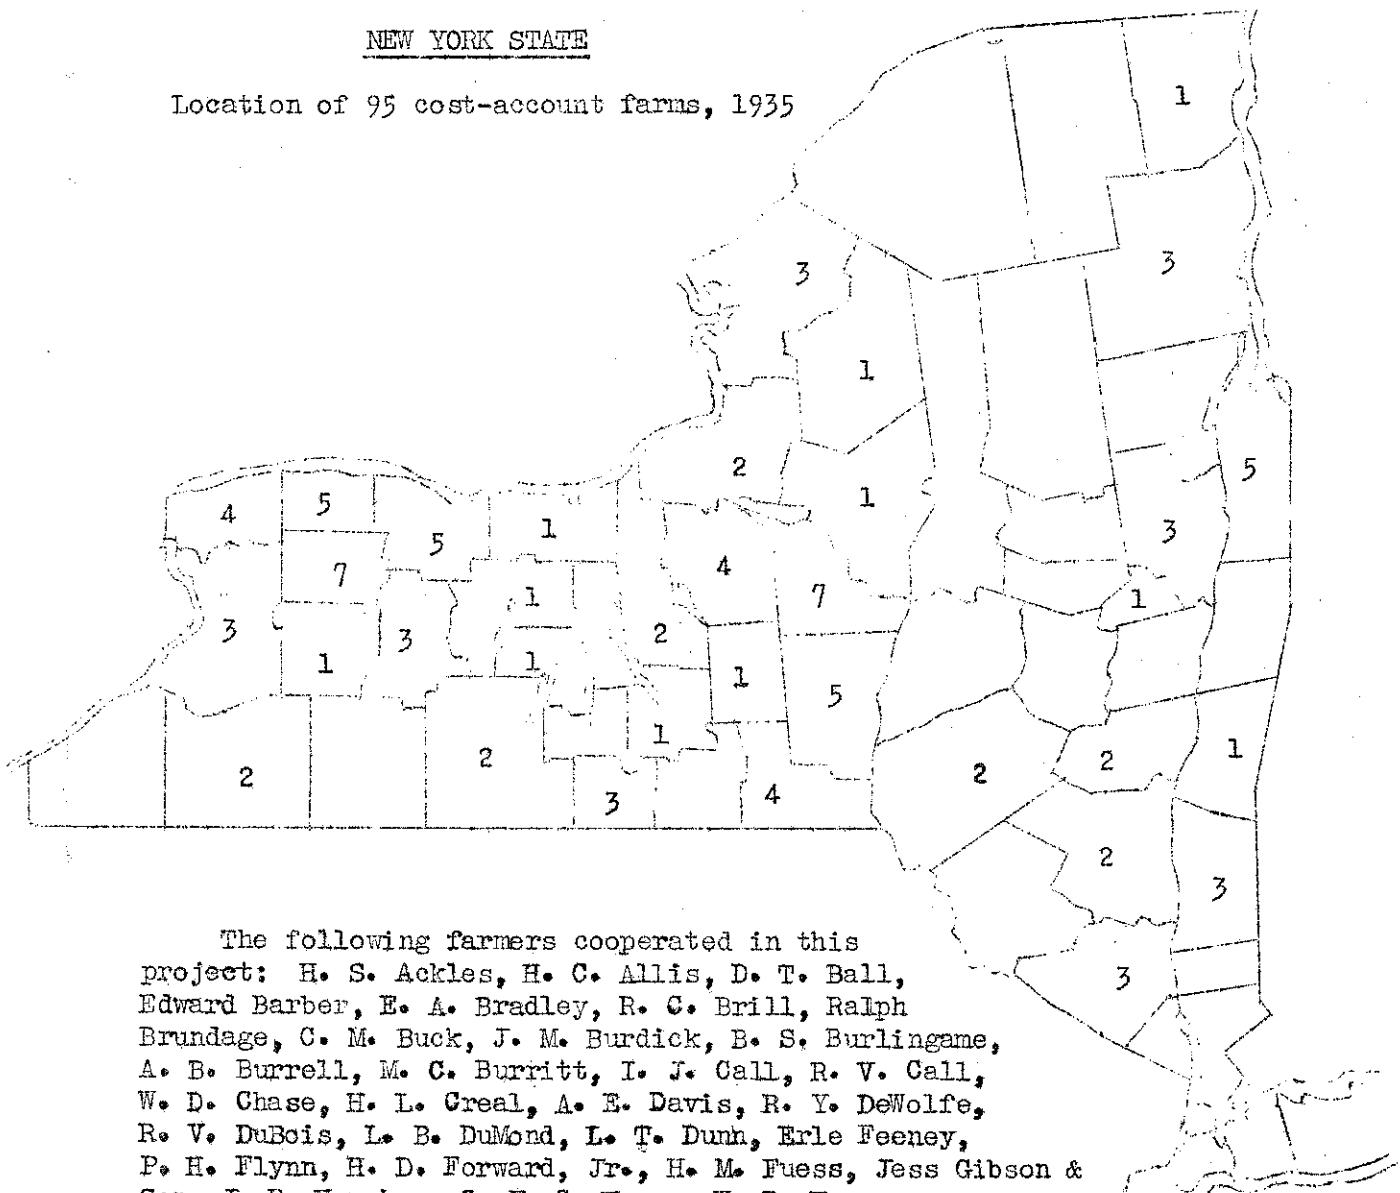

Acknowledgments: The work is made possible through the cooperation of the farmers who keep the records. Grateful acknowledgment is also made to the work of Mrs. M. B. Brown, Miss Louise Buell, Miss Frances Davis, Miss Pearl Russell, Miss Mary Shulman and Mrs. G. H. Stone in closing the books and tabulating the results.

- D. D. Whitson, A. L. Wilson, Charles Zefers.

## LABOR INCOMES

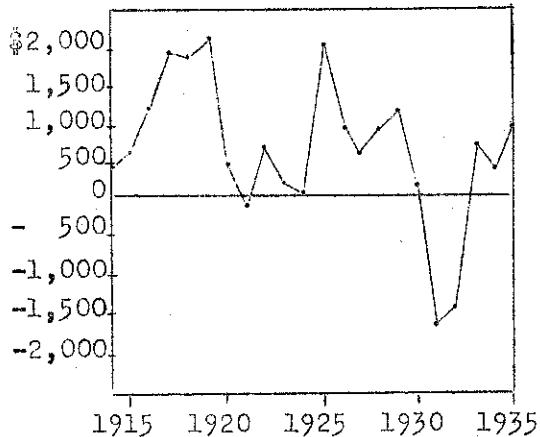

Average Labor Income,  
95 cost-account farms, 1935

Cash receipts	\$8,334
Increase in live- stock, equipment, etc.	<u>1,055</u>
Total farm receipts	\$9,389
Cash expenses	6,910
Value board furnished hired help	108
Value unpaid labor other than operator	<u>215</u>
Total farm expenses	7,233
Farm income (income from capital and from operator's labor)	\$2,156
Interest paid in cash	276
Income from operator's capital and operator's labor	\$1,880
Interest at 5% on operator's net worth of \$19,398	970
Labor income*	\$ 910

Cost-account farmers had a better year in 1935 than in other recent years. The average labor income\* of cost-account farmers was \$910, which is higher than in any year since 1929, and is \$600 higher than in 1934. This improvement was largely due to higher prices for milk, eggs, and potatoes - three important New York farm products.

Average Labor Incomes for 22 Years

## Cost-Account Farms

One farmer in four made a labor income of more than \$2000 in 1935, but on another fourth of the farms there was a minus labor income. The two farms making the highest labor incomes in 1935 made an average loss of \$2104 in 1934.

In the past twenty-two years, the average labor income on cost-account farms has been \$638. During the past six years, 1930 to 1935, labor incomes on cost-account farms have averaged minus \$175.

\* Labor income is what a farmer receives for his year's work and management, after all farm business expenses including interest on the investment have been deducted from farm receipts. In addition, the farmer has the use of a house and farm products for home use. It is comparable to the wages of a married hired man who is provided with a house, milk, wood, and other farm products for use in the household.

## LAND AND BUILDINGS

Land and buildings on cost-account farms were valued at \$17,579 per farm in 1935, or about three times the state average. The value per acre was \$94, one-half of which was represented by the value of the buildings. Cropland was valued at \$54 per acre, pasture and fences at \$15, woods at \$16, and bearing orchards at \$159.

The cost of repairs, insurance, taxes, depreciation and interest on the farm operator's dwelling averaged \$309, or \$26 per month. These "overhead" costs for the barns averaged \$581 per farm.

School, county and town taxes averaged \$236 per farm or 1.3 per cent of the value of the farm.

## Averages from 94 accounts - 1935

	<u>1933</u>	<u>1934</u>	<u>1935</u>
Number of farms	73	93	94
Acres per farm	185	185	187
Value per farm	\$20,166	\$18,317	\$17,579
Value per acre	\$109	\$99	\$94
Taxes (school, county and town):			
per farm	\$240	\$226	\$236
per acre	\$1.30	\$1.22	\$1.26
Value of all buildings per farm	\$9,571	\$9,051	\$8,774
Operator's houses:			
value per house	\$3,000	\$2,884	\$2,846
annual cost per house	\$292	\$295	\$309
annual cost in per cent of value	9.7	10.2	10.9
Buildings other than dwellings:			
value per farm	\$5,216	\$4,992	\$4,879
annual cost per farm	\$581	\$565	\$581
annual cost in per cent of value	11.1	11.3	11.9
Cropland:			
acres per farm	101	96	90
value per acre	\$60	\$53	\$54
annual cost per acre	\$4.27	\$3.77	\$3.74
annual cost in per cent of value	7.1	7.1	7.0
Bearing orchards:			
number of farms having orchards	20	23	24
acres per farm having orchards	48.2	48.6	47.4
value per acre	\$202	\$177	\$159
annual cost per acre	\$13.12	\$14.56	\$12.58
annual cost in per cent of value	6.5	8.2	7.9

## LABOR

Labor cost 28 cents an hour in 1935, which was the same as the previous two years.

The regular hired men were paid an average of \$46 per month in cash, and furnished with house, wood, milk, fruit and other farm products worth \$15 per month, or a total wage of \$61 per month. Hired men boarded with family were paid \$33 per month in cash and the board was valued at \$20. Those who worked for wages only were paid \$49. Day and hour help was paid 22 cents per hour, or 2 cents more than in 1934.

The operator valued his time at \$67 per month in addition to \$37 in farm privileges, or a total of \$1248 per year. The work of other members of the family who worked on the farm was valued at \$55 per month or \$660 per year.

The average number of hours of farm work per man was the equivalent of 327 nine-hour days, 294 ten-hour days, or an average of 8 hours for every day in the year. This annual average has not varied much during the twenty-two years in which cost accounts have been kept. However, it does vary on individual farms. The tendency is for men to work longer hours on small farms than on large farms. This is probably due to the fact that the operator does a larger proportion of the work on small farms than on large farms.

In the table on the opposite page, the labor costs for individual farms are arranged according to the number of men working on the farm. Twelve months of work are considered the equivalent of one man.

All cost-account farms are "family farms", i. e. - the operator works and directs the work of the men. The largest third of the farms had 4.4 men in addition to the operator. Operators on these farms considered their own time worth \$116 per month. The smallest third were "two-men" farms - one hired man and the operator. These farmers valued their own time at \$92 per month.

Cost of Labor, 95 farms - 1935

	Cost per farm <u>dollars</u>	Per cent of total <u>per cent</u>
<u>Labor operator:</u>		
Wage allowance	842	28.7
Privileges:		
house rent	206	7.0
other privileges	248	8.5
Total - labor operator	1,296	44.2
<u>Unpaid labor:</u>		
Wage allowance	190	6.5
Board or privileges	60	2.0
Total - unpaid labor	250	8.5
<u>Hired labor:</u>		
Cash wages	1,172	40.0
Privileges	135	4.6
Board furnished	72	2.5
Compensation insurance	7	0.2
Total - hired labor	1,386	47.3
Total - all labor	2,932	100.0

## WORK HORSES

The cost of horse work, including a charge for the use of harness, averaged 16 cents per horse hour. This was one cent per horse hour lower than in 1934, due mainly to lower feed costs.

The average value of the horses included in these accounts was \$116 per horse, or \$6 higher than in 1934.

The average cost of an hour's work for one man and a two-horse team was 60 cents.

On about one-tenth of the farms the cost of horse work was more than 30 cents per horse hour, while on another one-tenth, costs were below 10 cents per hour. Differences in the costs per hour of horse work were largely due to differences in the amount of horse work to be done. On most farms where there was at least 1000 hours of horse work per horse, costs were below average. On most farms with less than 500 hours of horse work per horse, costs per hour were higher than average.

## Cost of Horse Work, 85 accounts - 1935

	Quantity per horse	Value per horse	Per cent of total
		dollars	per cent
<u>Costs</u>			
Grain	2,028 lbs.	30.91	24.7
Hay	3.1 tons	29.49	23.6
Pasture and fences		3.32	2.7
Other feed and bedding		3.71	3.0
Total feed and bedding		67.43	54.0
Man labor	96.9 hrs.	27.83	22.4
Depreciation		7.77	6.2
Use of buildings		8.81	7.1
Interest		5.92	4.7
Shoeing		3.16	2.5
Veterinarian and medicine		1.14	0.9
Miscellaneous		2.74	2.2
Total cost to keep a horse		124.80	100.0
<u>Credits</u>			
Allowance for manure	8.2 tons	8.87	
Other credits		1.12	
Total credits		9.99

Harness cost		5.76	
Total cost of horse work		120.57	
Number of horses per farm	3.1	Hours worked per horse	736
Value per horse	\$116	Cost per hour	\$0.16

## TRACTORS

8 horse-power on drawbar, 16 horse-power on pulley. Tractors of this size (mainly Fordsons) were valued at \$206 per tractor. They were used only about half as many hours as the larger tractors. Costs averaged 58 cents per hour or 86 cents per hour for tractor and driver. A 2-horse team and driver cost 60 cents per hour on cost-account farms. The cost of operating an 8-16 tractor for one hour was equal to the cost of a team and driver for 1.4 hours.

10 horse-power on drawbar, 20 horse-power on pulley. The 10-20 was the most popular-sized tractor on cost-account farms. They were valued at \$389 and were used an average of about 400 hours. Because they were used more than the smaller tractors, the costs averaged 5 cents less than for the 8-16's, or 53 cents per hour.

15 horse-power on drawbar, 30 horse-power on pulley. Accounts were kept with 14 large tractors. They were valued at \$717. The average depreciation was \$102 per tractor, or 5 times as much as for the 8-16's. It is necessary to have a large amount of tractor work to make the ownership of a large tractor economical. The 3 accounts with the smallest amount of tractor work had an average cost of \$1.08 per hour, or 54 per cent more than the three accounts with the largest amount of tractor work to be done.

## FARM MOTOR TRUCKS

The cost of operating "pick-up" farm trucks averaged 5.7 cents per mile or one-half cent per mile less than the 1½-ton trucks. Small trucks were driven about 4500 miles compared with 6300 miles for the large trucks. Small trucks were driven 12 miles on a gallon of gas compared with 8 for the large ones.

Averages from individual accounts are arranged in the two tables here according to the number of miles driven. The cost of operating small trucks was kept below 5 cents per mile only on those farms where trucks were driven 5000 miles or more. Some farmers were able to operate 1½-ton trucks for less than 5 cents per mile but in most such cases, these trucks were driven at least 10,000 miles during the year.

The most important factor affecting the cost of hauling farm produce by truck is the number of miles the truck is driven. Many farmers are finding it economical to do some hauling for neighbors. Others find that they can save money by owning a small, cheap truck and hiring their produce hauled to market.

Factors from 19 accounts with Small TRUCKS (1 ton or less) - 1935

Farm number	Average value	Average per truck			Miles of use per truck	Miles per gallon of gas	Average cost per mile

## DAIRY COWS

Cost-account dairymen had a much better year in 1935 than in 1934. This improvement was due mainly to the following:

Milk prices up (\$1.90 per hundredweight in 1935; \$1.78 in 1934).

Cow values up (\$94 in 1935; \$87 in 1934).

Feed costs down (grain feed \$29 per ton or \$1 cheaper; hay \$10.50 or \$2 cheaper).

Calf values up (valued at \$2 more).

Returns per hour of labor in 1935 averaged 33 cents, or 17 cents higher than in 1934.

The average production of cost-account dairies is much above the average of the state (8137 pounds of milk per cow compared to about 5420 for the state). In spite of this high production, it cost 24 of these 60 dairymen more to produce their milk than they received for it.

The 20 farms with the highest profit produced milk for \$1.58 per hundredweight and sold it for \$1.95, leaving a profit of 37 cents per hundredweight. The low-profit group lost 37 cents per hundredweight. The average cost of producing milk on the 60 farms was \$1.81. The average returns was \$1.90 per hundredweight.

## INCUBATION

Hatching paid an average return per hour of labor of \$2.13. The median return per hour (one-half of the farms above and one-half below) was \$1.50. It cost about 8 cents to hatch a chick or 3 cents less than its value.

The average hatch was 62 per cent with a range of from 48 per cent to 68 per cent. Hatching eggs were valued at 38 cents per dozen, or 8 cents higher than commercial eggs. The cost of eggs amounted to two-thirds of the cost of the chicks.

## CHICKS

Brooding paid 34 cents per hour of labor in 1935, or 5 cents more than in 1934.

Chicks cost an average of \$11.36 per hundred. Out of 100 chicks put under the brooder:

- 6 were sold as chicks at 22 cents each;
- 8 pullets were sold at an average age of 6 weeks at 63 cents each;
- 25 pullets were raised and transferred to laying flock at \$1.02 each;
- 1 cockerel was sold at an average age of 10 weeks for 44 cents;
- 1 cockerel was transferred to the laying flock at \$1.83;
- 32 broilers were sold at 36 cents each; and
- 27 birds died.

Since some pullets and cockerels were sold before maturity, two birds sold at 10 weeks of age were considered equivalent to raising one bird to 20 weeks of age in calculating costs. Receipts from the sale of chicks and broilers were considered as reductions in the cost of raising birds for the laying flock. It cost \$1.04 to raise a pullet to laying age. It required 12 pounds of grain and 19 pounds of mash for each bird raised to maturity. Feed costs amounted to 46 per cent and the cost of the chicks to 25 per cent of the cost of raising pullets.

If a poultryman could reduce the mortality from 27 to 15 per cent by buying healthy, sturdy chicks he would thereby reduce his costs more than enough to justify his paying \$1.50 per hundred more than average for his chicks.

Costs and Returns from 38 accounts - 1935

	Quantity per bird raised*	Value per bird raised*	Per cent of total

## HENS

Cost-account poultrymen had a better year in 1935 than in 1934. This improvement was due mainly to better egg prices (30 cents in 1935, 26 in 1934 and 23 in 1933).

Returns per hour of labor averaged 48 cents in 1935. This is the best showing since 1930. Forty of the 41 farmers made something for the time spent on the laying flock, but 11 of them did not make as much as the cost of wages on those farms.

It cost 27 cents to produce a dozen eggs in 1935, or 2 cents less than in 1934. This reduction in cost, together with the 4-cent improvement in price, made it possible for these poultrymen to make an average profit of 3 cents per dozen.

Production on cost-account farms averaged 146 eggs per hen, or about 44 eggs more than the average for the state.

The number of birds that died or were lost or stolen during the year was one-fourth of the average inventory by months. High mortality is one of the most important causes of failure in the poultry business.

## FEEDER LAMBS

Four of the 6 cost-account farmers who fattened lambs in 1935 lost money on the enterprise. Returns per hour of labor averaged minus 10 cents as compared with minus 1 cent in 1934, and plus \$1.03 in 1933.

Feeder lambs cost \$5.79 per lamb, or 9.8 cents per pound. The average gain was 27 pounds per lamb. The sale price averaged \$9.13 per lamb or 10.6 cents per pound.

It required an average of 165 pounds of grain and 198 pounds of hay, in addition to the pea ensilage and other feed, for each lamb sold. Although the feed was charged to the lamb accounts at \$3.04 per lamb sold, much of it did not have a ready market value.

## Factors from 6 accounts - 1935

1932	71	3.2	-1.04

Sheep are a side-line on New York farms. Of the 95 cost-account farms, 10 had small flocks ranging from 4 to 151 sheep. It required an average of 4.6 hours of labor per sheep to care for the flock. Returns per hour averaged 25 cents.

Mutton and wool have a high value per pound, so they can be shipped long distances economically. The abandoned farm lands of New York cannot compete in sheep production with the range lands of the West because of the high cost of winter feed in New York. On good New York farms sheep cannot compete with dairy cows. However, small farm flocks do have a definite place on farms in western New York to make use of feeds, pasture, and barn space that might otherwise be wasted.

1935	11	0.44	21
1934	6	0.21	- 9

On 18 of the cost-account farms, pork was produced for home consumption. Some farmers kept a few sows and sold weaned pigs to the neighbors. Most of them bought from 2 to 5 weaned pigs to fatten.

It paid these farmers to produce their own pork. After charging the pig fattening enterprise with the market price for feed and a share of the overhead cost of running the farm, there was 44 cents per hour left as pay for the time spent on it. This was 16 cents more than the average farm wage.

## CABBAGE

Cabbage sold for \$3 per ton more in 1935 than in 1934 on cost-account farms. Higher prices and better yields resulted in an average return of \$89 per acre, or \$42 more than in 1934.

Returns per hour on cabbage averaged 42 cents, as compared with 5 cents in 1934. On only 2 of the 22 farms were returns too low to pay costs other than labor while one-third of the cabbage accounts made more than 50 cents an hour.

Cabbage yields averaged 9.3 tons per acre and ranged from 4 to 20 tons.

## CANNING-FACTORY PEAS

Good yields, combined with a price about as high as in 1934, resulted in relatively good returns from canning-factory peas in 1935. The yield was a little less than one ton of shelled peas per acre as compared with about one-fourth ton in 1934. The average price was \$57 per ton or only \$4 less than in 1934.

Every farm with yields of one ton per acre or more made a profit on the canning-factory pea enterprise in 1935.

Returns for labor averaged 54 cents per hour, which is the best return made by canning-factory peas on cost-account farms since 1930.

The cost of seed is almost 40 per cent of the total cost of growing peas. It is becoming a general practice for canning factories to share the risk of growing peas by guaranteeing the seed. If this is not in the contract, the grower may find himself in debt for the seed in years of crop failures.

## SWEET CORN

Sweet corn paid 21 cents per hour of labor in 1935 as compared with 42 cents in 1934. Yields and prices were each 18 per cent below 1934.

It cost about 10 cents to grow and harvest a dozen ears of sweet corn.

## Factors from 10 accounts - 1935

## DRY BEANS

Bean prices as well as yields were low on cost-account farms in 1935, resulting in a loss of about \$9 per acre. Returns per hour of labor on beans averaged minus 4 cents as compared with plus 44 cents in 1934.

Although growing costs were about the same as in 1934, the lower yield (11 bushels in 1935, 14 bushels in 1934) resulted in a greatly increased cost per bushel (\$2.63 per bushel, or 85 cents more than in 1934). Prices averaged \$1.83 per bushel or 29 cents below the previous year.

## CANNING-FACTORY TOMATOES

The tomato enterprise made a better showing in 1935 than in 1934, due mainly to the improvement in tomato prices.

The crop sold to the canning factory graded 76 per cent No. 1, 23 per cent No. 2, and 1 per cent culs. Prices per ton averaged \$14 for No. 1, \$6 for No. 2, \$20 for the small proportion (total of 4 tons) sold for market, or \$11.68 average for the total crop.

Yields were lower than in 1934 (7.5 tons per acre, or 1.1 tons below 1934).

The average returns per hour of labor was 37 cents, or 4 cents higher than in 1934.

Plants, set at the rate of 3000 per acre, cost \$15 per acre of one-fifth of the total. It required 109 hours of labor to grow and harvest an acre of tomatoes, which accounts for one-third the total cost.

## POTATOES

Potato prices in 1935 were double 1934 prices on cost-account farms (55 cents per bushel in 1935, 28 cents in 1934). This gave growers with good yields a chance to recover some of the money they lost the previous year.

Returns per hour averaged 52 cents as compared with minus 8 cents in 1934.

Yields averaged 155 bushels per acre or 37 bushels less than in 1934. This is the lowest yield on cost-account farms since 1927. The highest yield in 1935 was 297 bushels per acre and the lowest, 29. Even with the relatively high prices received for potatoes in 1935, no farm with less than 100 bushels per acre made any profit on the potato enterprise.

## APPLES

In spite of better yields (180 bushels of marketable apples in 1935, 131 in 1934), apple growers keeping cost accounts made less money in 1935 than in 1934. This was due mainly to the decline in price from 75 cents to 50 cents per bushel. (These prices are net, after deducting cost of packages, commission, storage and transportation. Gross prices averaged 67 cents in 1935 and 86 cents in 1934.)

Returns per hour of labor averaged 34 cents in 1935, 52 cents in 1934.

It cost an average of 48 cents to grow, harvest and market a bushel of apples that sold for 50 cents.

The two growers who made the most money from the apple enterprise obtained very high yields and kept their costs down. Although they got but little more than the average price for their apples, their large acreage and efficient methods enabled them to make an excellent profit.

Only 7 of the 24 apple accounts failed to show some return for the time, after paying all costs other than labor. About one-half paid better than the average farm wage.

Costs and Returns from 24 accounts - 1935

## HAY

Hay yields in 1935 were higher but prices were only about one-half the abnormally high prices of 1934. Alfalfa paid all costs of production but accounts with other types of hay showed an average loss.

Costs of producing an acre of alfalfa were relatively high (higher taxes and interest because better land is used, high seed cost, lime, etc.) but because of better yields the costs per ton were not so high as for stands of mixed clover and alfalfa, clover and timothy, or straight timothy.

	Alfalfa	Mixed leguminous	Clover and timothy	Non-leguminous

## HAY

Alfalfa, in 1935, cost \$8.44 per ton, was valued at \$8.49 per ton, which left a profit of 5 cents per ton. Returns per hour averaged 30 cents, or slightly more than the cost of wages. On 3 of the 51 farms, alfalfa produced 4 or more tons of hay per acre and 1.2 tons was the lowest yield.

Mixed leguminous hay accounts were kept with fields which had some alfalfa in the mixture. It cost \$8.55 to produce a ton of this hay which was valued at \$7.54 or \$1.01 less than cost.

Clover and timothy yields averaged 1.5 tons per acre and in no case exceeded 3 tons per acre.

Non-leguminous hay, usually timothy, averaged 1.3 tons per acre, ranging from 0.6 to 3.4 tons.

Costs and returns from mixed leguminous hay (some alfalfa in the mixture) on 24 farms are shown in the above table. The acreage of hay varied from 2 to 118 acres per farm, with an average of 29 acres. Yields varied from 0.8 to 5.1 tons per acre. Most of the farms making a profit on mixed leguminous hay had yields of more than 2 tons per acre. It required an average of 11 man hours to mow, rake, load and draw the hay produced on an acre but this varied with the yield, equipment used and distance from the barns. The highest returns per hour of labor was \$1.00 and the lowest, minus \$1.10. The average return per hour was 10 cents. One farmer made \$505 profit on 85 acres of mixed leguminous hay while another lost \$399 on 29 acres.

During the past four years (1932 to 1935) the average yield of clover and timothy hay on cost-account farms has been between 1.3 and 1.6 tons per acre. The cost of growing, harvesting and marketing a ton has been \$10 or \$11 each year but the market value of the hay at the barn, has varied from \$7 to \$14. Returns per hour varied from minus 47 cents in 1932 to 73 cents in 1934.

1932	40	1.6	18	12	11	8	7	- 3	-0.49	-229

Timothy hay (shown in the table above) usually costs more than it is worth. On 22 of the 24 farms, the costs of growing, harvesting and storing were more than the value of the hay. It does not necessarily follow that these farmers should stop growing timothy hay. Perhaps some fields are adapted to nothing better. Perhaps the hay is worth more than the amount that could be saved by plowing up an old seeding since in that case some of the costs have already been incurred. It does mean that farmers usually lose money by growing timothy on land adapted to the production of alfalfa.

Yield per acre	9.3 tons	Acres per farm	13.4

## CORN

Corn silage costs averaged \$4.18 per ton or 50 cents less than in 1934. Yields averaged 9 tons per acre, or about the same as in other recent years.

It is common practice to manure heavily before planting corn silage. The average charge for manure was \$7.80 per acre or about one-fifth of the total cost of growing and harvesting corn silage. Labor of growing and harvesting amounted to one-fourth of the total cost.

Corn for grain was grown on 15 of the 95 cost-account farms. The average yield was 37 bushels per acre as compared with 22 in 1934. It cost \$1.04 to grow and harvest a bushel of corn valued at 85 cents. The returns per hour for time spent on corn was 14 cents.

1933	5	28	38	19	1.28	0.58	60	-0.10 - 99
1932	6	41	48	31	1.07	0.66	62	0.02 -105
1931	6	35	57	46	1.51	1.18	63	0.15 - 63

The yield of shelled corn on the 15 farms varied from 19 to 86 bushels per acre. The lowest cost of growing and harvesting a bushel of shelled corn, 56 cents, was on a 1-acre field producing 86 bushels per acre. The highest cost, \$1.85 per bushel, was on a 9-acre field producing 25 bushels per acre. A small error in measuring the area on such a small field results in a large error in the averages per acre.

New York farmers can grow corn and get fairly good yields of grain but they cannot, as a rule, make any money from it. In each of the twenty-two years from 1914 to 1935, there was an average loss on this enterprise.

## GRAIN

Grain yields on cost-account farms were about the same in 1935 as in 1934 but prices were much lower. Returns on most grain crops were too low to pay costs other than labor.

1932	18	28	24	18	0.77	0.55	12	-2	-0.13	-110
1931	19	35	32	21	0.84	0.52	16	-5	-0.33	-204

## Summary of Profit from Farm Enterprises - 1935

Enterprise	Number of accounts	Average size	Average profit
<u>Livestock</u>			
Dairy cows	60	21 cows	\$ 152
Incubation	10	36,166 eggs	731
Chicks	38	2,673 chicks	22
Hens	41	760 birds	276
Sheep	10	71 sheep	- 15
Feeder lambs	6	552 lambs	-248
Hogs	18	11 pigs	21
<u>Fruit crops</u>			
Apples	24	36 acres	137
Cherries	12	5 acres	321
Peaches	9	7 acres	80
Pears	10	11 acres	14
<u>Grain crops</u>			
Barley	13	13 acres	- 85
Corn	15	4 acres	- 28
Oats	29	14 acres	- 85
Oats and barley	34	14 acres	- 89
Oats, barley and peas	5	18 acres	-114
Wheat	35	17 acres	27
<u>Hay crops</u>			
Alfalfa	51	22 acres	3
Mixed leguminous	24	29 acres	- 62
Clover and timothy	28	27 acres	-111
Non-leguminous	24	25 acres	- 81
<u>Cash crops</u>			
Beans, dry	9	16 acres	-143
Cabbage	22	10 acres	160
Corn, sweet	10	6 acres	- 20
Peas, canning-factory	11	11 acres	96
Potatoes	28	22 acres	389
Tomatoes, canning-factory	9	10 acres	129

## Summary of Returns per Hour of Labor
