COSTS AND RETURNS FOR THE TURKEY ENTERPRISE, 1943

By E. G. Misner

This bulletin is a report of turkey enterprise costs and returns on 32 farms for the year ended January 31, 1944. A record of the feed and of the other expenses, and of the number, weight, and the receipts from turkeys sold, was taken from account books as far as possible. The costs for which no records were kept were carefully estimated by the growers. Maximum prices established by the Office of Price Administration of the Federal Government were used in computing the returns for the turkey enterprise in 1943.

In 1943, the turkey enterprise was only part of the farm business of some of the farms, while on others it comprised the entire business of the operator. The average number of turkeys raised on the 32 farms was 1840 per farm, and the live weight 16.7 pounds per turkey. The dressed weight, considered to be 88 per cent of the live weight, averaged 14.7 pounds.

COSTS AND RETURNS IN RAISING TURKEYS

The costs of raising turkeys and the returns from them for 1943 are given in table 1.

The net cost of raising a turkey was \$6.27 in 1943. The cost per pound of live weight was 37.6 cents. Feed comprised about one-half and the labor charge about one-fifth of the cost of raising a turkey. The cost of poults represented about one-sixth of the cost of raising a turkey. Feed, labor, and poults together represented about 85. per cent of the cost of raising a turkey.

In 1943, the Office of Price Administration ceiling price for live turkeys was 35.3 cents per pound. At the O.P.A. ceiling price in 1943, the average price for dressed turkeys was 41.9 cents per pound. At these prices, the average value of a turkey was \$6.28. The return averaged 37.7 cents per pound of live weight at O.P.A. ceiling prices in 1943.

In 1943, after other costs were met, the return for labor amounted to only 7.3 cents per pound of live weight. In this computation, however, the turkeys raised and kept for breeding are credited to the young stock account at the value placed on them for breeding purposes which was higher than ceiling prices. If all turkeys had been credited at the ceiling prices in 1943, the return for labor per pound of turkey produced would have been 6.0 cents.

COSTS AND RETURNS FROM BREEDERS

In 1943, there were 12 of the 32 farms studied that kept turkey breeders at the beginning of the year with an average number of 280, including toms, per farm that kept breeders. The largest flock of breeders was 1505 and the smallest 16 at the beginning of that year.

The cost of keeping turkey breeders and of producing turkey eggs is given in table 2.

[#] Computed at 3 per cent.

^{*} Per hen breeder at beginning of year.

While breeders cost more than market stock per head because they are selected birds and are kept a few months longer than market stock before the mating season, the extra cost is probably not as much as the inventory value given is above the cost. When breeders are inventoried at a high value, the growing account profits by receiving credit for them at a high value, but the cost of hatching eggs and therefore of poults produced is increased correspondingly. Since breeders are disposed of for meat, their inventory value should be kept near to this value in accounting work, but the growers insisted on higher values and these were accepted and used.

The cost of producing hatching eggs in 1943 was 21.7 cents each, but when all of the toms, both at the beginning and at the end of the year, were inventoried at 312 and all of the hens at \$6, the cost was 20.8 cents. The average number of eggs produced per hen breeder at the beginning of the year was 52.

COST OF INCUBATION

The cost of incubating turkey eggs and of producing poults is given in table 3.

In 1943, 15 farms had incubation costs, and one purchased an incubator after the hatching season. Some of them had the eggs custom hatched. A total of 156,016 eggs were incubated from which 81,543 poults were hatched, an average of 52.3 per cent hatch of the eggs set. Excluding the value of the eggs, the net cost of incubation was \$50.02 per 1000 eggs or 9.5 cents per poult hatched in 1943. With the value of eggs incubated included at their cost of 22.6 cents each, the net cost of producing a poult was 52.8 cents in 1943. The net cost of incubation, excluding the value of the eggs, amounted to 9.5 cents per poult, or approximately 10 cents per poult hatched.

COSTS AND RETURNS FOR THE TURKEY ENTERPRISE FER FARM

In 1943, the turkey enterprise cost was \$6369 per farm for feed, \$2484 per farm for labor, \$993 per farm for purchased poults, and \$3205 for all else, a total of \$13,051 per farm. Computed at 0.P.A. ceiling prices, the total returns were \$13,364, the gain was \$313 per farm, and the return for labor \$2797 per farm from the turkey enterprise.

The costs and returns for the turkey enterprise per farm for 32 farms are given in table 4.

^{*} Hatching eggs charged at value given by growers.

* All returns, gains and returns for labor were computed at 0.P.A.
ceiling prices in 1943.

[&]quot;One farm sold a few started poults.

In 1943, the return for labor from the breeding flock was \$540 per farm with breeders. When the breeders were inventoried at \$12 per tom and \$6 per hen, at both the beginning and at the end of the year, the return for labor from breeders, using the value placed on the hatching eggs by the growers, was \$623 per farm with breeders.

The return for labor from the incubation account, in 1943, using the value given by the growers for hatching eggs and for poults, was \$549 per farm that hatched poults.

The return for labor on the young stock reared was \$2253 per farm. It has been estimated that an average of about two hours of labor is required to raise and market a turkey. On this basis the return per hour of labor would be 61 cents for 1943. Data on the hours of labor spent were not obtained.

The costs and returns per farm having turkey breeder accounts, and per farm growing market turkeys are given in table 5.

In 1943, the gain on incubation was \$384 per farm having incubation accounts, \$214 per farm having a breeding flock, while the gain on the growing flock at C.P.A. ceiling prices amounted to only \$20 per farm. The labor return on the growing flock was \$2253 per farm at ceiling prices, \$540 per farm on breeding flocks and \$549 per farm on the incubation accounts.

[·] Hatching eggs charged at value given by grower.

[&]quot; One farm sold a few started poults.

^{*} All returns, gains and returns for labor were computed at O.P.A. ceiling prices in 1943.

BUSINESS ANALYSIS FACTORS FOR THE TURKEY ENTERPRISE

A summary of the business analysis factors for the turkey enterprise, including the rearing, the breeder and the incubation accounts, is given in table 6.

VARIATION IN THE SIZE OF THE TURKEY ENTERPRISE

In 1943, of the 32 farms studied, 12 reared less than 800 turkeys, 10 from 800 to 2000, and 10 more than 2000 turkeys. The total pounds of turkey raised on a dressed equivalent basis ranged from 3362 to 117,762. Five farms produced from 20 to 30 thousand pounds each and 9 farms more than 30 thousand pounds each of dressed equivalent weight of turkey.

NUMBER, BREED AND VALUE OF TURKEY BREEDERS KEPT

All of the turkey hens and toms kept for breeding were only one year old. Higher egg production, better hatchability, a saving of feed and labor, saving in the use of buildings and equipment, and lower mortality results when turkey pullets, rather than yearling hens, are used for breeders. There is no advantage in using breeders more than one breeding season.

In 1943, there were 12 farms at the beginning of the year, and 16 at the end of the year that had turkeys on hand for breeding purposes. On the 12 farms, the average number of toms at the beginning of the year was 30 and of hens 250, or a ratio of one tom to 8.3 hens.

Of the breeding toms on hand at the beginning of the year, 251 were Bronze, 98 White Holland, 13 Bourbon Red, and 2 Black Spanish.

Of the hens on hand at the beginning of the year, 2112 were Bronze, 730 White Holland, 135 Bourbon Red and 22 Black Spanish.

In 1943, at the beginning of the year, the average value of toms was \$13.79 and at the end \$16.28. The average value of hens at the beginning was \$7.09, and at the end \$8.75. The average live weight per tom at the beginning of the year was 29.6 pounds and of hens 16.4 pounds.

In 1943, on 16 farms there were 3927 breeder hens and 573 breeder toms at the end of the year. Of the hens, 69 per cent were Brenze, and 30 per cent White Helland. There were only 36 Beurbon Red and Black Spanish turkeys found on these farms. There has been a shift from the White Helland to the Brenze breed. The average live weight reported for toms was 30.9 pounds and for hens 16.6 peunds at the end of the year. The weights were higher for Brenze than for White Hellands. Larger strains of Brenze turkeys have been developed along with a shift from White Helland to Brenze for commercial production.

There was a total of 2982 old turkey breeders sold for meat from the 12 farms that had breeders at the beginning of the year in 1943. The average live weight was 15.4 pounds; dressed equivalent 13.5 pounds. The price received was 39.3 cents per pound dressed equivalent, resulting in a return of \$5.31 each for meat from the breeders after the hatching season was over.

The numbers, average weights and values per bird by breeds of the turkeys kept for breeding purposes on hand at the beginning and at the end of the year are given in table 7 for 1943.

EGGS LAID, INCUBATED, SOLD FOR HATCHING, AND USED

The average number of eggs laid per hen breeder on hand at the beginning of the year was 52; the average value placed on eggs incubated was 24.9 cents, but the few eggs sold for hatching brought only 19.7 cents each. The value placed on the eggs for hatching was about 5 cents higher than the price at which they could have been disposed of for hatching. Small numbers of hatching eggs from select strains resulted in the high average price of 41.9 cents for hatching eggs purchased in 1943.

Practices of handling breeders are more intensive now than formerly. Birds are confined, protected from inclement weather, encouraged to eat and drink more, and given electric lights to encourage earlier production. These practices, together with improved breeding stock, have resulted in eggs earlier in the season and in more eggs per turkey hen breeder.

On 15 farms in 1943 an average of 9936 eggs produced, valued at \$2399 were incubated. As the turkey industry expands in New York, the average number of turkey breeders kept per farm that produces poults increases.

POULTS HATCHED AND POULTS SOLD

In 1941, the average percentage hatch was 52.3 per cent of the total ergs incubated. The average value placed on poults hatched was 64.4 cents. Of the total poults hatched, 3.7 per cent were hatched in March, 23.0 per cent in April. 35.9 per cent in May, 23.6 per cent in June, 7.6 per cent in July, and 0.2 per cent in August.

A total of 27 per cent of the poults were hatched in March and April in 1943. Earlier hatching has resulted in heavier weights of birds sold for meat. Not only has it resulted in heavier weights, but the growers now have a larger proportion of heavy-weight turkeys ready for the Thanks giving market than formerly. In this state, gains are more economically made on early-hatched turkeys sold at Thanksgiving than on later hatched birds which have to endure hotter weather when started and more inclement weather when being finished for the Christmas trade.

full 28 weeks growth before Thanksgiving, it is necessary to start poults in April. The number of poults hatched after June comprised only 8 per cent of the total in 19k3.

A total of 41,633 poults, or 51.1 per cent of those hatched were sold from the 15 farms at an average price of 65.3 cents each. The price of poults was about the same in each of the months. The cost of producing poults was 52.8 cents in 1943.

An average of 26.0 poults was produced per hen breeder on hand at the beginning of the year.

NUMBER, BREED AND VALUE OF POULTS STARTED

in April and May and a large number in June. More poults were started in March than in July.

The two leading breeds are Bronze and White Holland. A rember of growers claimed to have broad-breasted Bronze turkeys, but it was impossible to ascertain how many were of this type.

A total of 90,009 poults were started on the 32 farms in 1943, an average of 2813 per farm. The average value of the poults was 63.4 cents each. Of the total, 39,910 were home-hatched and 50,099 purchased, an average of 1566 or 55.7 per cent purchased.

Of the 90,009 poults started, 57 per cent were Bronze, 41 per cent White Holland, 2 per cent Bourbon Red. Of the poults purchased 58 per cent were white Holland, and 39 per cent Bronze. Of the home-hatched poults 80 per cent were Bronze and 18 per cent White Holland.

MORTALITY OF YOUNG AND CLD STOCK

Turkeys that disappeared on the range from foxes, owls or theft were included in mortality. Mortality represents the difference between the number of poults started and the number of birds recovered. Crowding is one of the most important causes of high mortality. It is good practice to expand the rearing facilities as rapidly as the size of the flock is expanded. It is not to be expected that the mortality of turkeys on farms that started 4000 or more poults would be as low as on those that started 400. The physical difficulties of tending to the brooders, of maintaining sanitary conditions and of preventing loss with a large number, naturally lead to higher mortality in the larger flocks. Most of the growers start their birds in confinement and later transfer them to the range.

In 1943, the mortality was higher on farms that started a large number of poults. It was slightly less on farms that purchased all or a large proportion of the poults started, partly because the average number started was less than on the others, and partly because home-hatched poults are not as carefully culled as those purchased.

The mortality of the breeding flock was about 16 per cent of the total number of breeders on hand at the beginning of the year. Mortality among breeders is mostly due to injuries to the hens from mating, and by toms to each other.

COSTS FOR YOUNG STOCK

Feed

In 1943, the feed cost was 3.24 per turkey raised and represented 60.6 per cent of the total cost per young turkey reared when the cost of poults was not included; 51.3 per cent of the cost when the cost of poults was included. The young stock used 103 pounds of feed per bird reared, costing 3.14 per 100 pounds. This amounted to 6.2 pounds of feed per pound of live weight, or 7.0 pounds per pound of equivalent dressed weight. More feed is required to produce a pound of turkey on farms in large flocks than in experimental trials with a few birds with low mortality and meticulous attention. About 5 pounds are required per pound of live weight under very favorable conditions with low mortality.

In 1943, prepared mashes were generally used for starting and growing turkeys. Many growers would have preferred using corn but it was not available that year. Most growers use a combination of grain and mash in raising turkeys. One grower who kept an accurate record used the mash pellet system throughout the entire period and produced an average live weight on Bronze of 18.46 pounds in 25.1 weeks on 4.8 pounds of feed per pound of live weight.

Dressed weight	\mathbf{X}	7.03	X

Litter

The litter charge amounted to 4 cents per bird. Staz-dry - a shredded/cane litter - was the most common kind of litter used for turkeys, altho some sand was used.

Human labor

The average labor charge per young turkey reared was 1.21. It represented 19.2 per cent of the total cost.

No record was obtained of the hours of labor spent in the rearing of turkeys. Specialized turkey growers are occupied directly with turkeys only from the time the poults come until they are disposed of at Thanks-giving or Christmas. If they are not keeping breeders, time is used for repairing brooders and equipment, cleaning and getting ready for the next flock.

Horse labor

The charge for the use of horses was less than 1 cent per turkey raised in 1943.

Use of tractor

The charge for the turkeys' share of the use of the tractor, including the interest, depreciation, insurance, housing and miscellaneous costs was 3 cents per turkey.

Use of automobile and truck

The charge for the use of automobile and truck amounted to 16 cents per turkey raised.

'Use of land

The charge for use of land amounted to 98 per farm for breeders and young stock.

The use of land charge to the growing flock represented 5 cents per turkey raised or 0.8 per cent of the cost in 1943.

TABLE 15. USE OF LAND FOR TUNEYS, 32 FARMS, 1943

Per form having breeders.

Use of buildings

The charge to turkeys for the use of buildings comprises interest, taxes, insurance, repairs and depreciation and other expenses on buildings. The total charge for use of buildings for the entire turkey enterprise averaged 426 per farm.

The use of buildings charge to the growing flock was 19 cents per young turkey raised or 3.0 per cent of the cost of raising a turkey.

TABLE 16. USE OF BUILDINGS FOR TURKEYS, 32 FARMS, 1943

o an di

Interest on stock

Interest was charged to the young stock account at 3 per cent of the value of the poults started. To the breeding account, it was charged at 3 per cent on the average inventory value of turkey breeders on hand at the beginning and the end of the year 1943.

The interest on the value of the poults amounted to 3 cents per young turkey reared of 0.5 per cent of the cost in 1943.

Interest on costs

Interest on costs, including the cost of feed, litter, human labor, horse labor and miscellaneous charges, was computed at 1.5 per cent, and amounted to 7 cents per bird or 1.1 per cent of the cost in 1943.

Cost of poults

The average cost of poults was 97 cents per turkey raised. This was 15.3 per cent of the total cost of raising a turkey.

Miscellaneous

The miscellaneous expenses for young turkeys reared, such as fuel and electricity for brooding, disinfectants, supplies, stationery, bags, cord, boxes for the market stock, telephone, and other minor items of expense were charged under miscellaneous costs. The charge for custom hatching of eggs was included in the miscellaneous charges to the incubation account. The miscellaneous charges amounted to 25 cents per turkey reared or 3.9 per cent of the cost in 1943.

On some of the farms, watch dogs were kept on the range, and a share of the expense for their keep was charged to the turkoy enterprise. On other farms, although dog served as a watch over the flock, no expense was charged for the dog tax or for his keep.

NUMBER AND VALUE OF TURKEYS RAISED

In 1943, a total of 13,481 birds or 25 per cent of the total were sold alive and 40,930 or 75 per cent were sold dressed. At C.P.A. ceiling prices, the average value of turkeys sold dressed was \$6.11 and of turkeys sold alive \$1.92. The average live weight equivalent of turkeys sold dressed was 16.5 pounds; the average price on a dressed basis \$41.9 cents a pound. The average live weight of birds sold alive was 16.8 pounds; the average price 35.3 cents a pound of live weight. Dressed birds at ceiling prices returned only 19 cents each more than birds sold alive. Obviously there was no profit in dressing turkeys to be sold at ceiling prices.

In 1943, the feed used for the production of 972,879 pounds of turkey and of 149,456 hatching eggs and 41,633 poults sold averaged 6.7 pounds per pound of live weight of turkey.

CAPITAL USED FOR THE TURKEY ENTERPRISE

The capital required for raising turkeys is so large that credit is necessary if a large number is raised.

In 1943, the total capital used by the turkey enterprise was \$9943 per farm, \$5.44 per turkey produced, \$0.37 per peund of dressed turkey, \$0.88 per dollar of turkey produced and \$81 per \$100 receipts from the turkey enterprise. The value of the grower's dwelling and the value of much of the idle land and of other buildings not used by turkeys was not included in the capital. When these are included, the capital used exceeds the receipts. The objective should be to develop sufficient size of enterprise so that the annual receipts exceed the capital used by the enterprise.
