INTRODUCTION

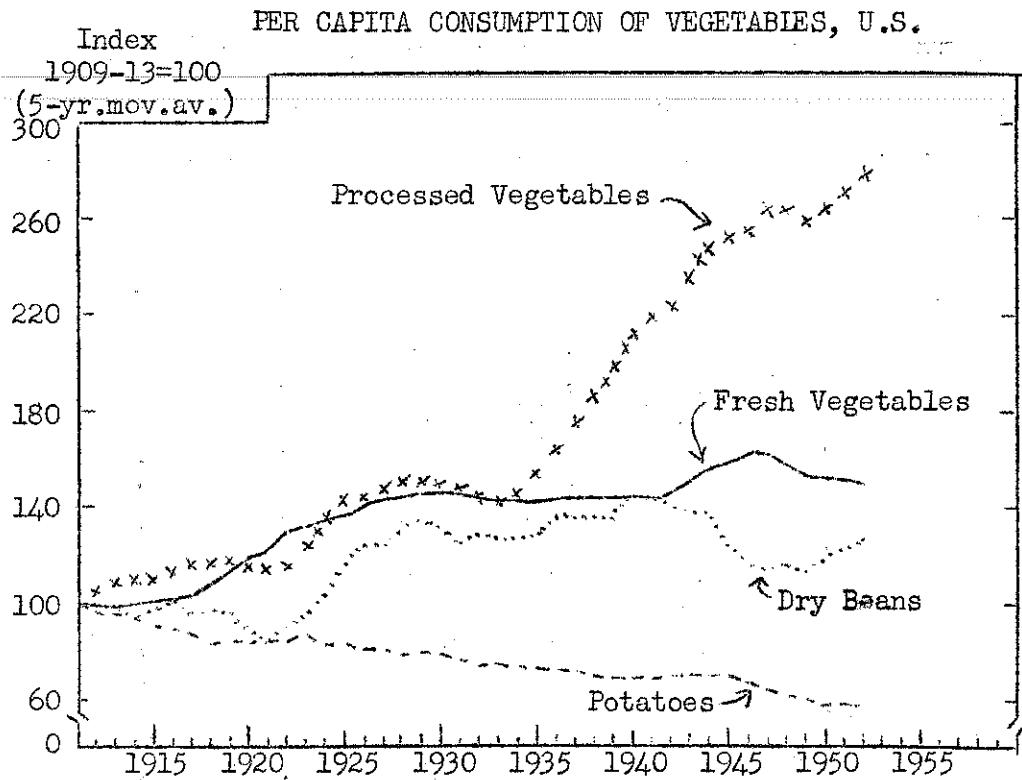

The purpose of this mimeographed report is to bring together information previously appearing in two mimeographed A.E. reports and to bring the material up-to-date -- A.E. 664 and A.E. 442.

The dot distribution maps from township data of the United States Census of Agriculture of 1950 show the location of total acreage, both for market and for processing, of the more important vegetable crops plus dry beans, potatoes and strawberries.

Annual estimates of acreage, yield, production and price show the trends of each of these over the period from 1918 to 1953 to the extent that information is available for the full 35 years.

Change is one of the most certain things in our agriculture. The information contained in this publication reports some striking changes made by farmers over the period of a generation. Some of these changes reflect change in management on the farm -- specialization, the use of more and better fertilizer, improved varieties, better control of insects and disease, and more efficient use of machinery, labor and other facilities on the farm. These changes also reflect changes in utilization and consumption of these commodities, for example, we are eating far less peas from the pod and many more frozen by the processor. The acreage of green peas for market in the United States reached more than 100,000 acres in the 1930's and dropped to less than 20,000 acres in the early 1950's. In the same period the acreage of peas for canning and freezing increased from less than 300,000 to more than 400,000 acres.

Changes of this sort are shown graphically for each vegetable for which the figures are available.

Source: U.S. Censuses of Agriculture.

From the Census of Agriculture we get a clue as to the changes in the number of farms raising different kinds of crops and livestock and in the acreage devoted to each crop. This table shows a decline of 56% in 30 years of the number of farms reporting "vegetables for harvest." The acreage, on the other hand, in the same 30-year period showed an increase of 57%.

The figures from the 1950 Census of Agriculture showing the acreage of vegetables by townships provided the basis for the enclosed commodity dot distribution maps showing the location of the production of vegetable crops in New York.

Although the production of vegetables for market in New York increased during the past two and a half decades, the increase has not been as consistent as the average for the United States. In the late 1940's and early 1950's, average annual tonnage was only a little greater in New York than for the prewar years whereas the United States production was up about a third.

New York production of vegetables for processing showed more consistent gain in the late 1940's and early 1950's than vegetables for market. But, the production of vegetables for processing in New York also fell behind the increase for the entire country.

ACREAGE OF VEGETABLE CROPS HARVESTED IN NEW YORK

Commodity	Prewar Average 1937-41	5-Year Average 1947-51	% Change 1947-51 Av. from Prewar Av.	1953
For Market:				
Lima Beans	3,460	2,860	- 17	1,500

Tomatoes	19,320	21,460	+ 11	16,600
Total for Processing	96,806	110,854	+ 15	114,770
Total for Market & Processing	211,364	222,314	+ 5	213,970
Other:				
Dry Beans	148,000	153,000	+ 3	132,000
Potatoes	203,000	125,000	- 39	106,000
Strawberries	4,700	3,780	- 20	3,900
Grand Total	567,064	504,094	- 11	455,870

In the 5-year period, 1947-51, acreage of market vegetables in New York was slightly smaller than in the prewar years, 1937-41. The acreage of vegetables for processing was 15% larger than before the war.

The total acreage in vegetables, dry beans, potatoes and strawberries showed a decline of 11% from prewar. This change was due largely to the 39% decrease in the acreage of potatoes.

*1929-32 average, earliest years reported.

**1923-27 average, earliest years reported.

Yields of vegetables during the 5-year period, 1947-51, were greater than 30 years earlier except for carrots, cucumbers and tomatoes for market, and snap beans, cucumbers and green peas for processing.

The most spectacular increase in this three decade comparison is the 147% increase in the average yield of potatoes.

Average yields in New York were above the United States average for the mid-century 5-year period except for cantaloupes and celery for market, lima beans, snap beans, cucumbers and green peas for processing. The New York yield of dry beans is about the same as the average for the entire country.

The most striking increase in vegetable production from the late 1930's to the late 1940's occurred in lima beans and snap beans for processing and snap beans for fresh market.

Total production of potatoes was about one-fifth greater than prewar even though acreage showed a decline of 39%.

New York production was more than 10% of the country's supply of snap beans (11%), sweet corn (15%), onions (17%), cabbage (19%), lima beans (20%), and cauliflower (26%) for market. Among the vegetables for processing New York produced more than 10% of the snap beans (17%), beets (25%) and cabbage (42%).

DRY BEANS

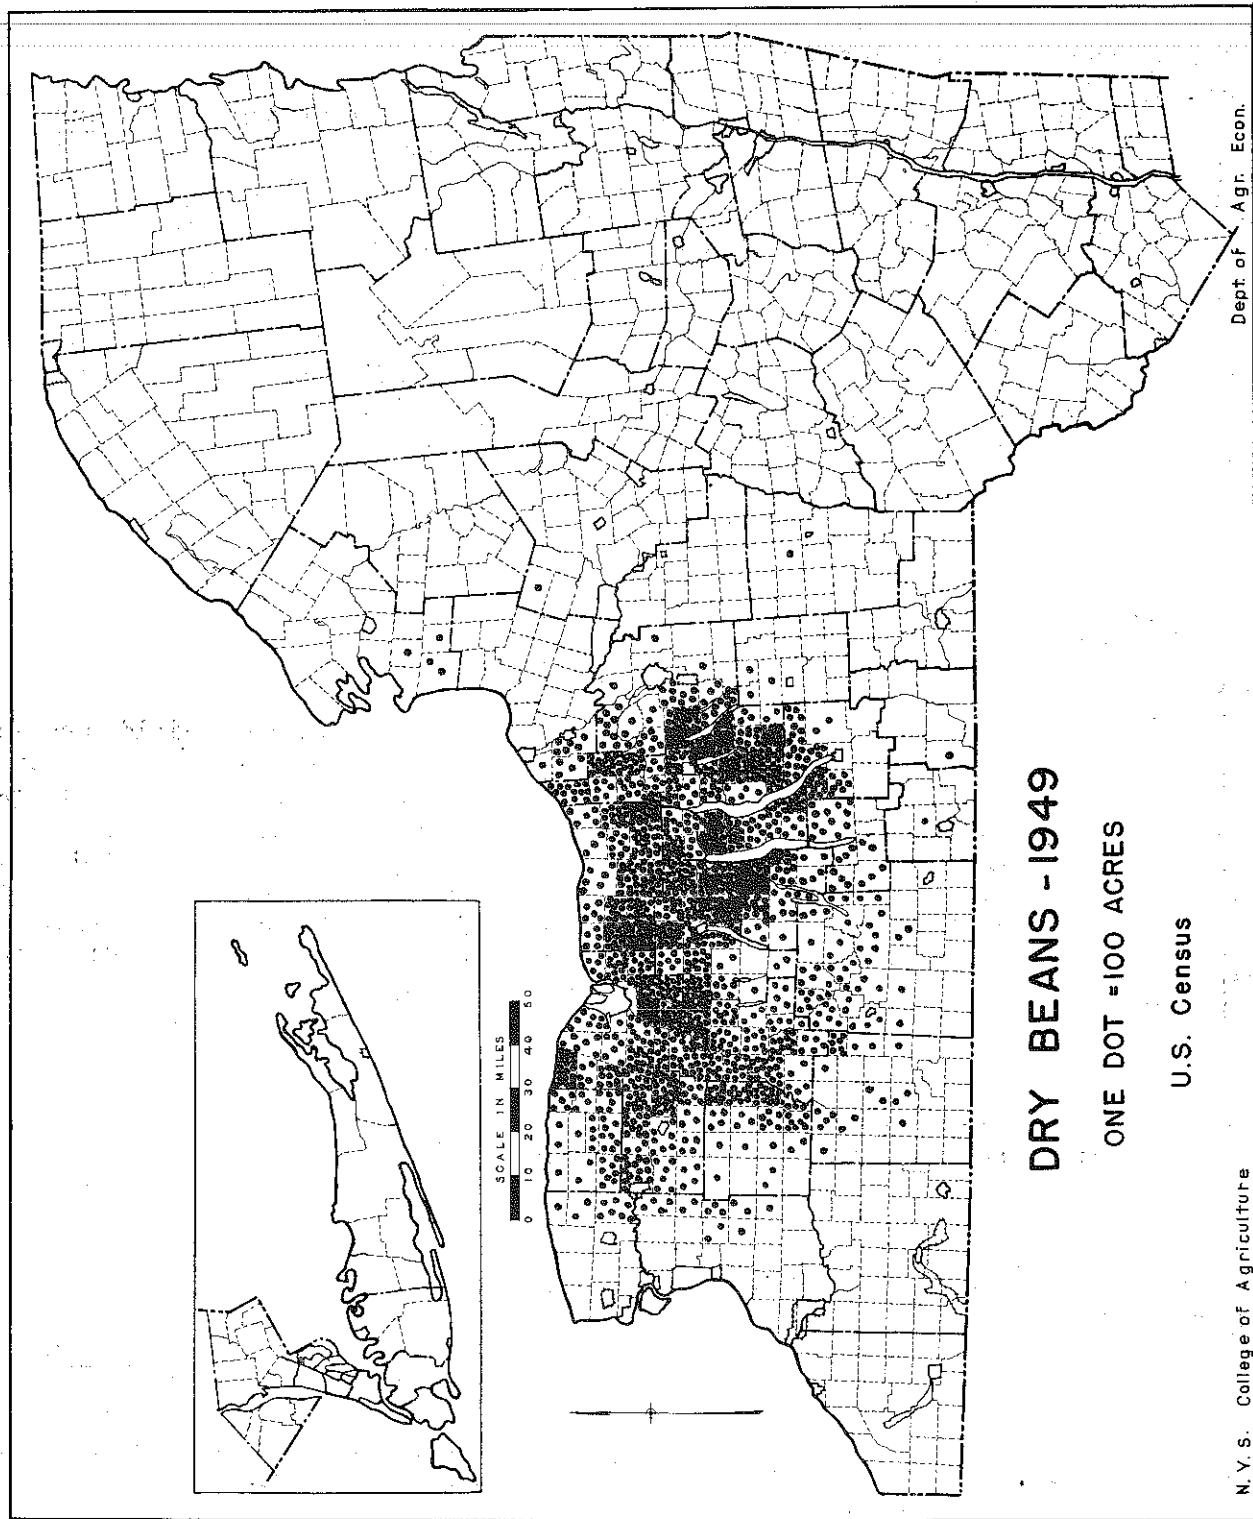

The dry bean acreage of New York State was reported as 165,575 acres in the 1950 Census of Agriculture. Annual estimates of acreage around this Census period showed variations from 130,000 to 179,000 acres each year. New York farmers produce less than 10% of the beans raised in the United States.

Most of the dry beans produced by New York farmers are raised in the west-central counties of the State. This means from Syracuse west and from Lake Ontario south to the mountainous areas of the Southern Tier counties.

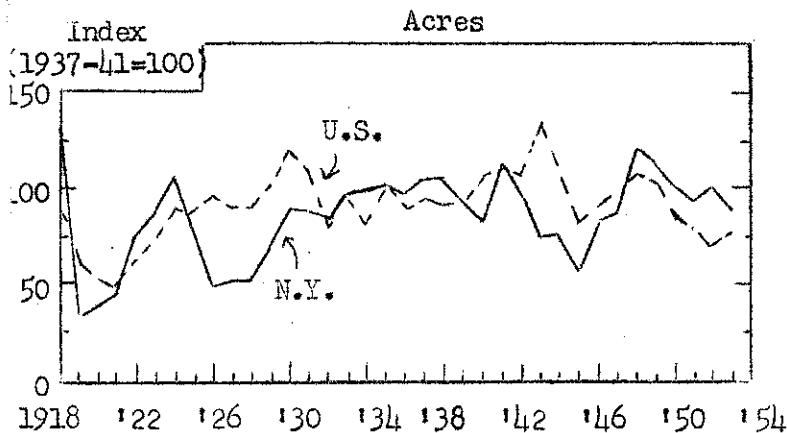

A.B. 951

41-

DRY BEANS

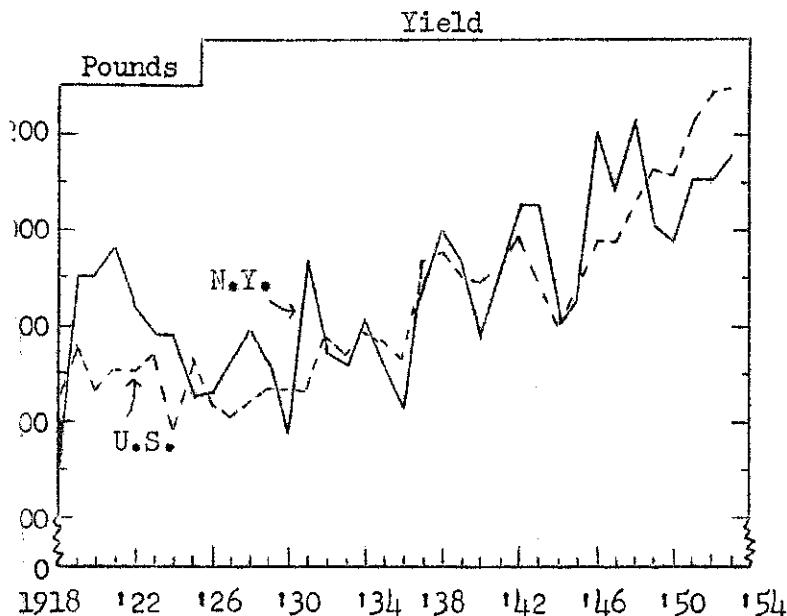

DRY BEANS

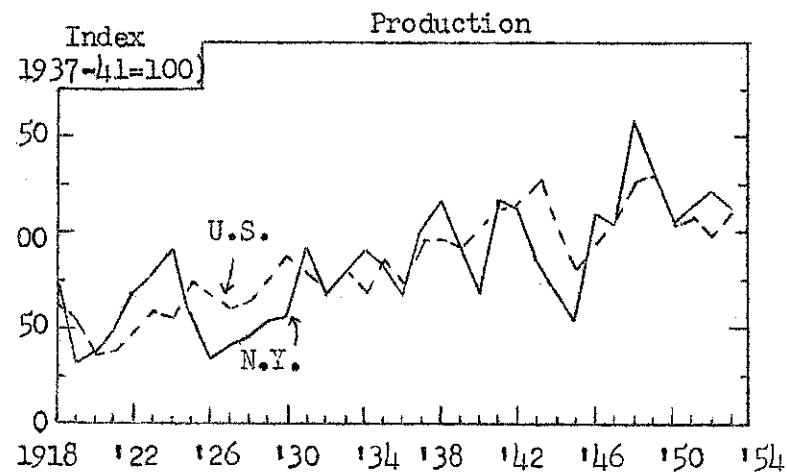

The United States acreage of dry beans showed a tendency to increase slightly from World War I to World War II. The acreage in 1951 to 1953 was smaller than at any time since 1920.

In New York, the long-time trend has been upward with sharp drops in the mid-1920's and mid-1940's.

The average yield per acre of dry beans in both New York and the United States has been upward. The increase was fairly steady from the mid-1930's to the mid-1950's. Average yields above 1,000 pounds per acre were common in the late 1940's and 1950's.

The trend in the production of dry beans has been gradually upward. This increase has been about in line with the increase in population. High support prices immediately after World War II encouraged large production and resulted in heavy government purchases of dry beans. Price support levels were reduced and acreage and production returned to a more normal trend.

LIMA BEANS

Township data on the acreage of lima beans from the Census of 1950 indicates the heavy concentration of lima beans on Long Island, particularly the "Northern Fork." The next most important area of lima bean production is in Cayuga County with additional rather intensive areas in Madison and Wayne Counties.

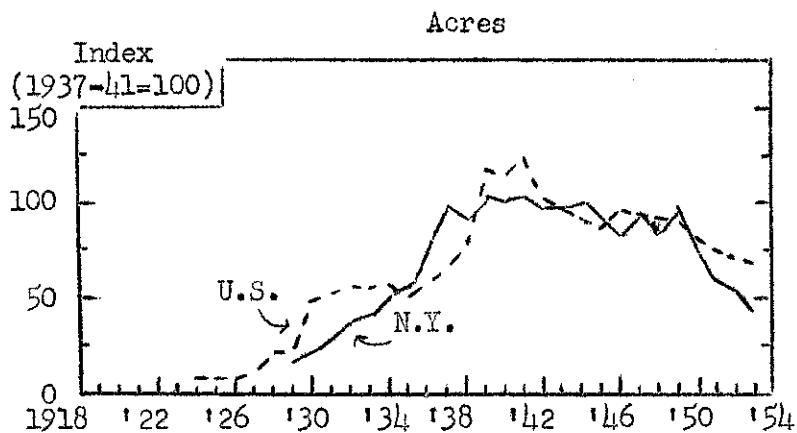

In the years from 1929-1932 only 65 acres of lima beans were reported for processing and 938 for fresh market. After expanding up through World War II gradually the acreage of lima beans for fresh market has declined in recent years while the acreage of lima beans for processing has increased.

In the years 1947-51 the annual average acreage was 2,400 for processing and 2,860 for fresh market. For the ten-year period, 1942-51, 38% of the lima bean acreage in New York State was grown for freezing and canning.

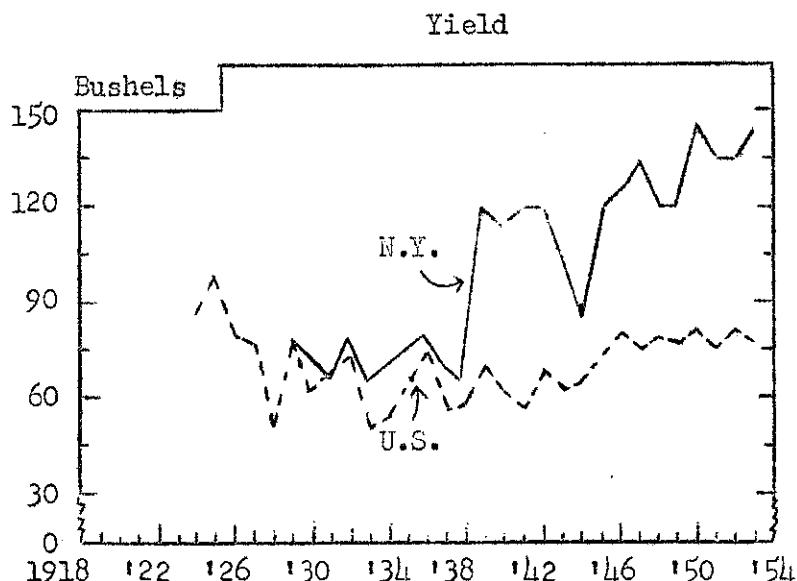

LIMA BEANS

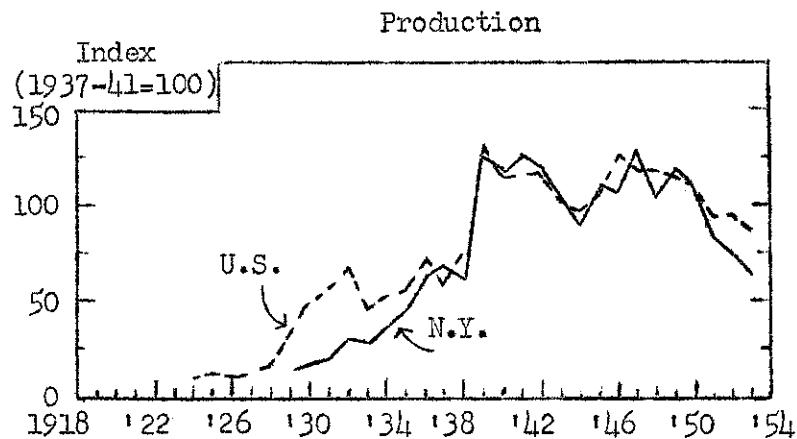

FOR MARKET

The acreage of lima beans for fresh market increased from the mid-1920's to the early 1940's. During the next decade the acreage of market lima beans declined in New York State and the country as a whole.

The U. S. average yield of lima beans per acre was slightly higher in the late '40's and the early '50's than in the previous two decades. Average yield of market lima beans in New York which is well above the U. S. average continued to increase during the 1940's and early 1950's.

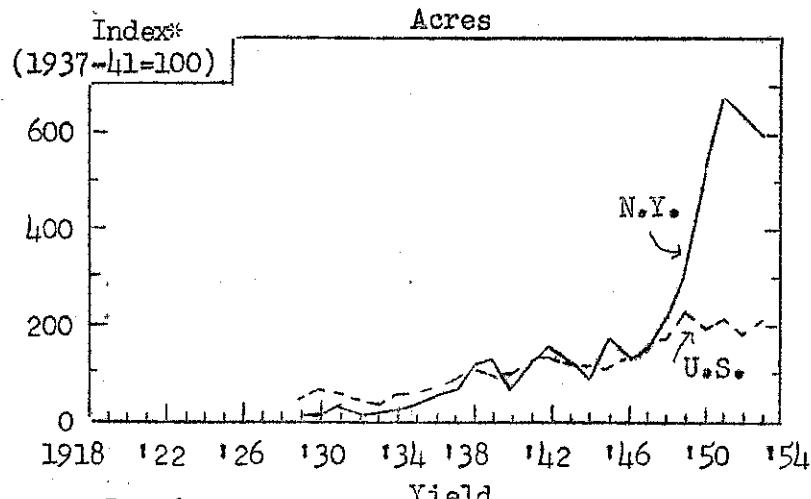

Lima bean production for market sale increased sharply from the late 1920's to the late 1930's and declined following World War II. The trend was similar in New York to that of the United States.

LIMA BEANS

FOR PROCESSING

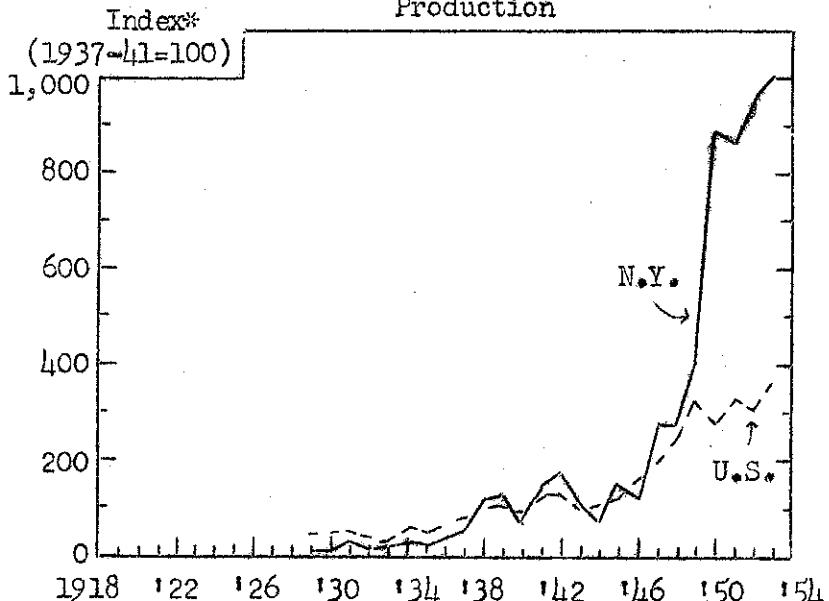

The U. S. acreage of lima beans for processing expanded gradually from 1930 to the end of World War II. Little change in acreage occurred from 1949 to 1953.

In New York, the acreage of lima beans for processing increased sharply following 1947.

After World War II, the yield per acre of lima beans for the U. S. increased steadily up to 1953. Yield per acre in New York also averaged higher than in earlier years for the period 1946-1953.

The production of lima beans for processing increased gradually from 1930 to the end of World War II and then expanded rapidly to provide beans for the growing frozen food market. The expansion in production in New York was much more spectacular than for the country as a whole.

* Note quadruple scale used.

SNAP BEANS

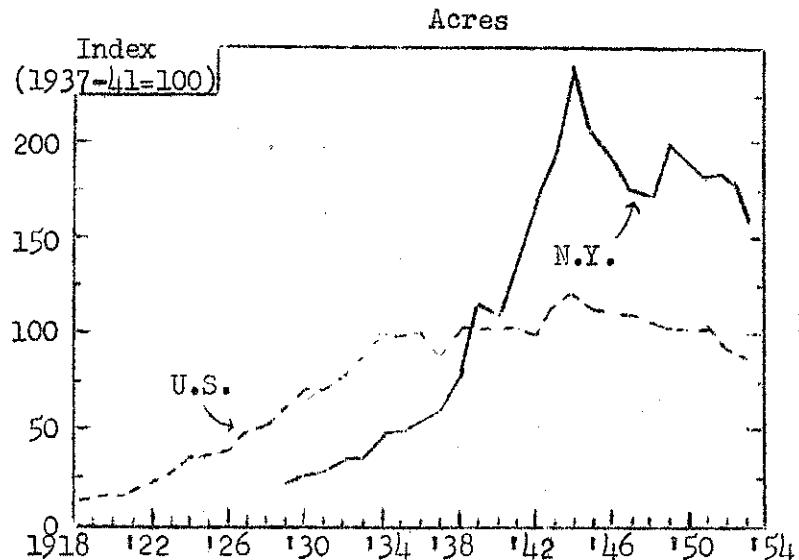

The intensive areas of snap bean production in New York State are in Oneida, Madison, southern Herkimer and Chenango Counties, in Cayuga County, and in southern Erie and northern Chautauqua Counties. Some of the snap beans raised near the large metropolitan areas are sold for fresh market consumption and some of those raised in the more rural areas are also shipped to market. A large proportion of the acreage goes to processors for freezing and canning.

In the ten-year period, 1942-51, about 15,000 acres were reported for the fresh market and 20,570 acres for processing. Of this total of about 36,000 acres, 58% was used for freezing and canning.

The phenomenal expansion of this crop in New York is indicated by the increase in the acreage of market beans from 2,250 acres in 1929-32 to 14,540 acres for the years 1947-51. An even greater increase has occurred in the acreage of snap beans for processing from 8,134 acres annually for the years 1928-32 to an annual average of 23,620 acres in the years 1947-51.

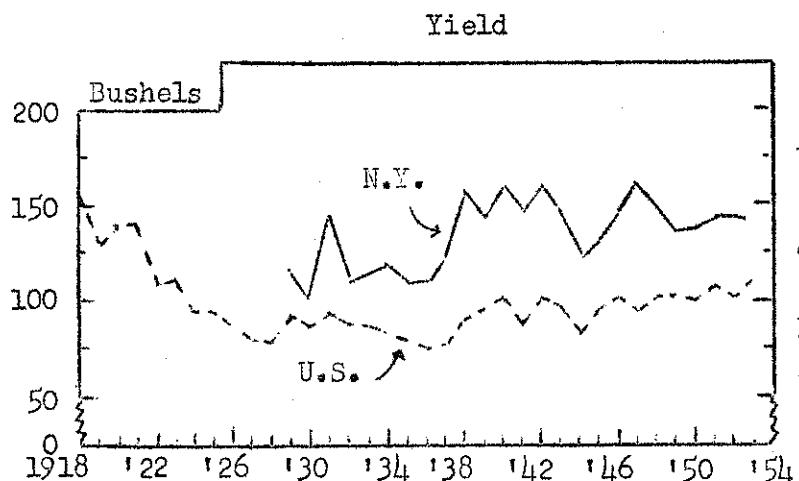

SNAP BEANS FOR MARKET

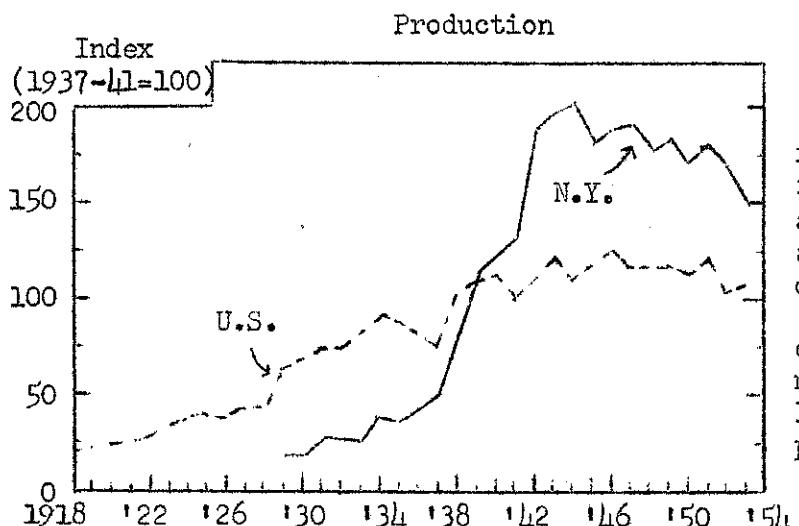

The acreage of snap beans for market in the United States expanded from 1918 to 1944. The market acreage of these beans declined gradually over the next ten years.

In New York, market snap bean acreage increased sharply from 1930 to 1944 and tended to decline somewhat over the next ten years.

The yield per acre of snap beans for market tended to decline in the United States from 1918 to the mid-1930's as acreage expanded. The average yield remained fairly constant at around a 100 bushels per acre over the next decade.

In New York, yields per acre have continued fairly constant around 140 bushels per acre.

The production of snap beans for market in the United States increased gradually from 1918 to about the end of World War II. A slight downward trend in total production followed.

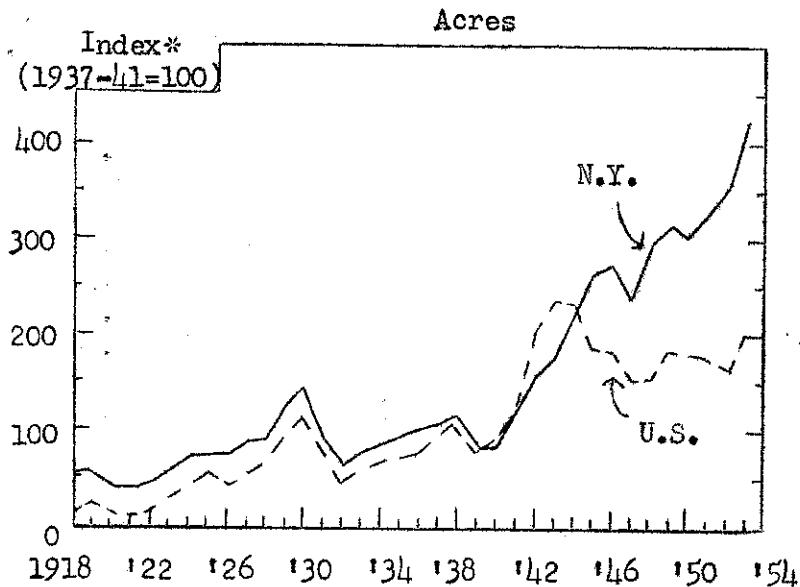

In New York, market bean production expanded sharply from the mid-1930's to 1944. This was followed by gradual decline in total production.

SNAP BEANS

FOR PROCESSING

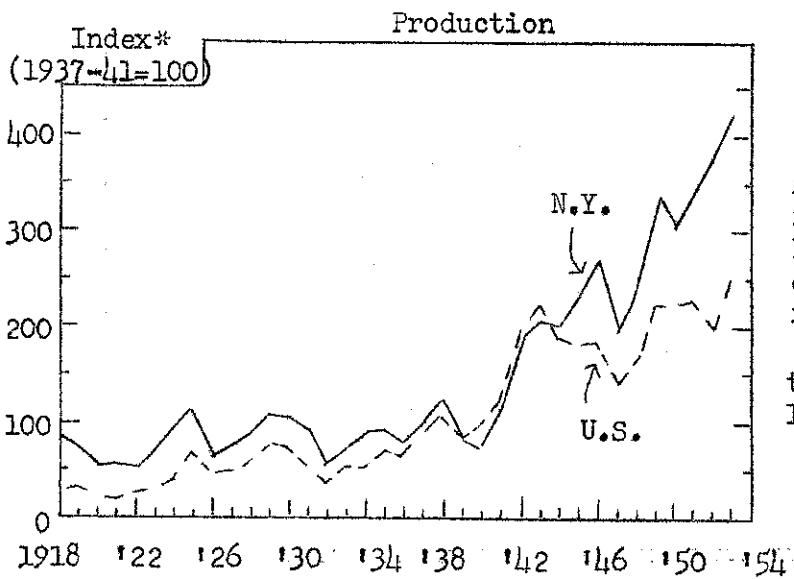

The acreage of snap beans for processing has expanded greatly over a period of 35 years. The trend in New York and the United States was similar from 1918 to 1943. During the next ten years the U. S. acreage did not expand but acreage of beans for processing in New York continued to grow.

* Note double scale used.

The average yield per acre tended to decline from 1918 to 1930 and gradually increased over the next 25 years. The average yield in New York showed less improvement than the average for the United States.

The production of snap beans for processing in the United States increased gradually from 1918 to 1940. A marked increase occurred during World War II and some further expansion followed the War.

The New York trend in production continued upward from 1931 to 1953.

* Note double scale used.

BEETS

The acreage of beets around the metropolitan areas goes mainly to the bunch and fresh beets for market. This is true of the acreage on western Long Island, in south-eastern New York and around the larger upstate cities.

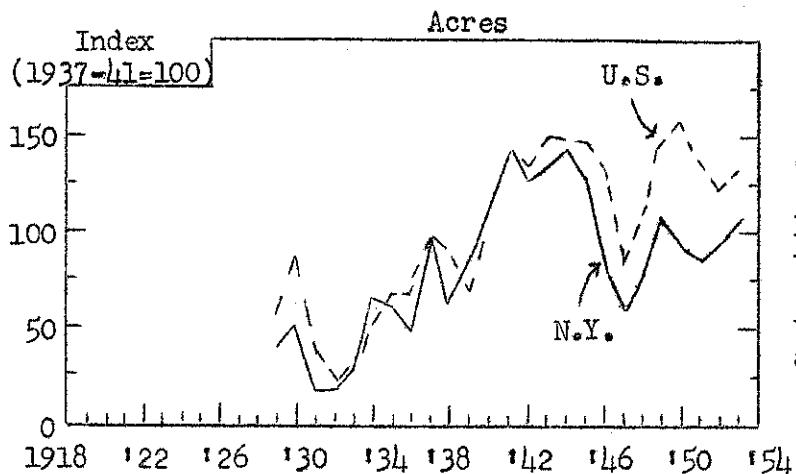

The great concentration of acreage for beets in Ontario County, in Wayne County and in the western part of Livingston County goes to canners. Most of these beets are raised on upland soils suitable also for carrots and cabbage.

Total Acreage for Market and Processing

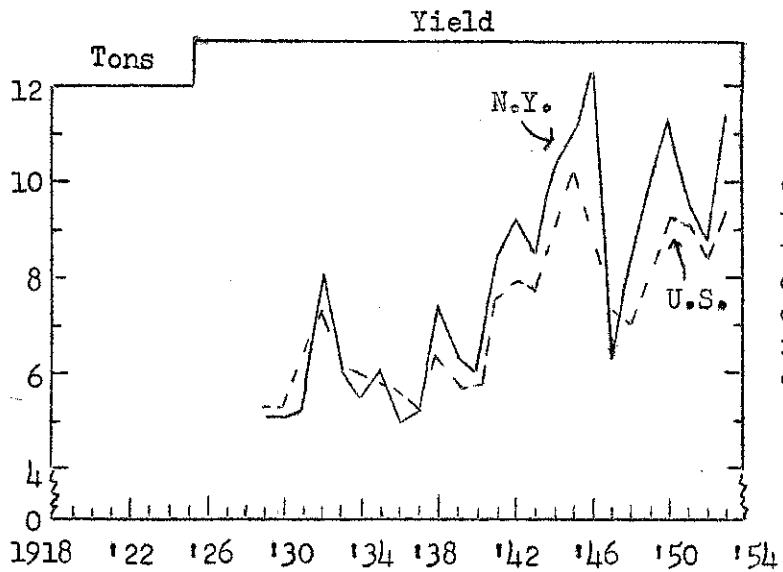

BEETS

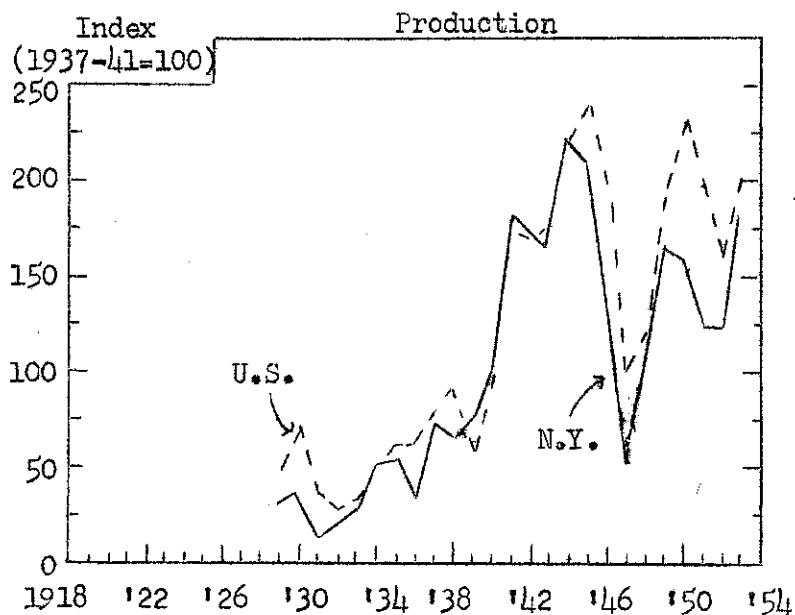

FOR PROCESSING

The acreage of beets for processing has fluctuated over the past 20 years from a low in 1932 to a high during the War years of about three times the acreage in years earlier. New York acreage amounts to about one fourth of the U. S. acreage of beets for processing.

The yields of beets for processing show considerable fluctuation from year to year and some upward trend over the past two decades. The very high yield during World War II may be explained in part by the unusually large size of beets accepted by processors.

The total production of beets for processing increased sharply from 1932 to the mid-war years of World War II. Production dropped sharply for the country as a whole and for New York in 1946 but expanded again to around 50% above prewar during the next few years. The New York production of beets for canning amounts to from one fourth to one third of the U. S. total.

CABBAGE

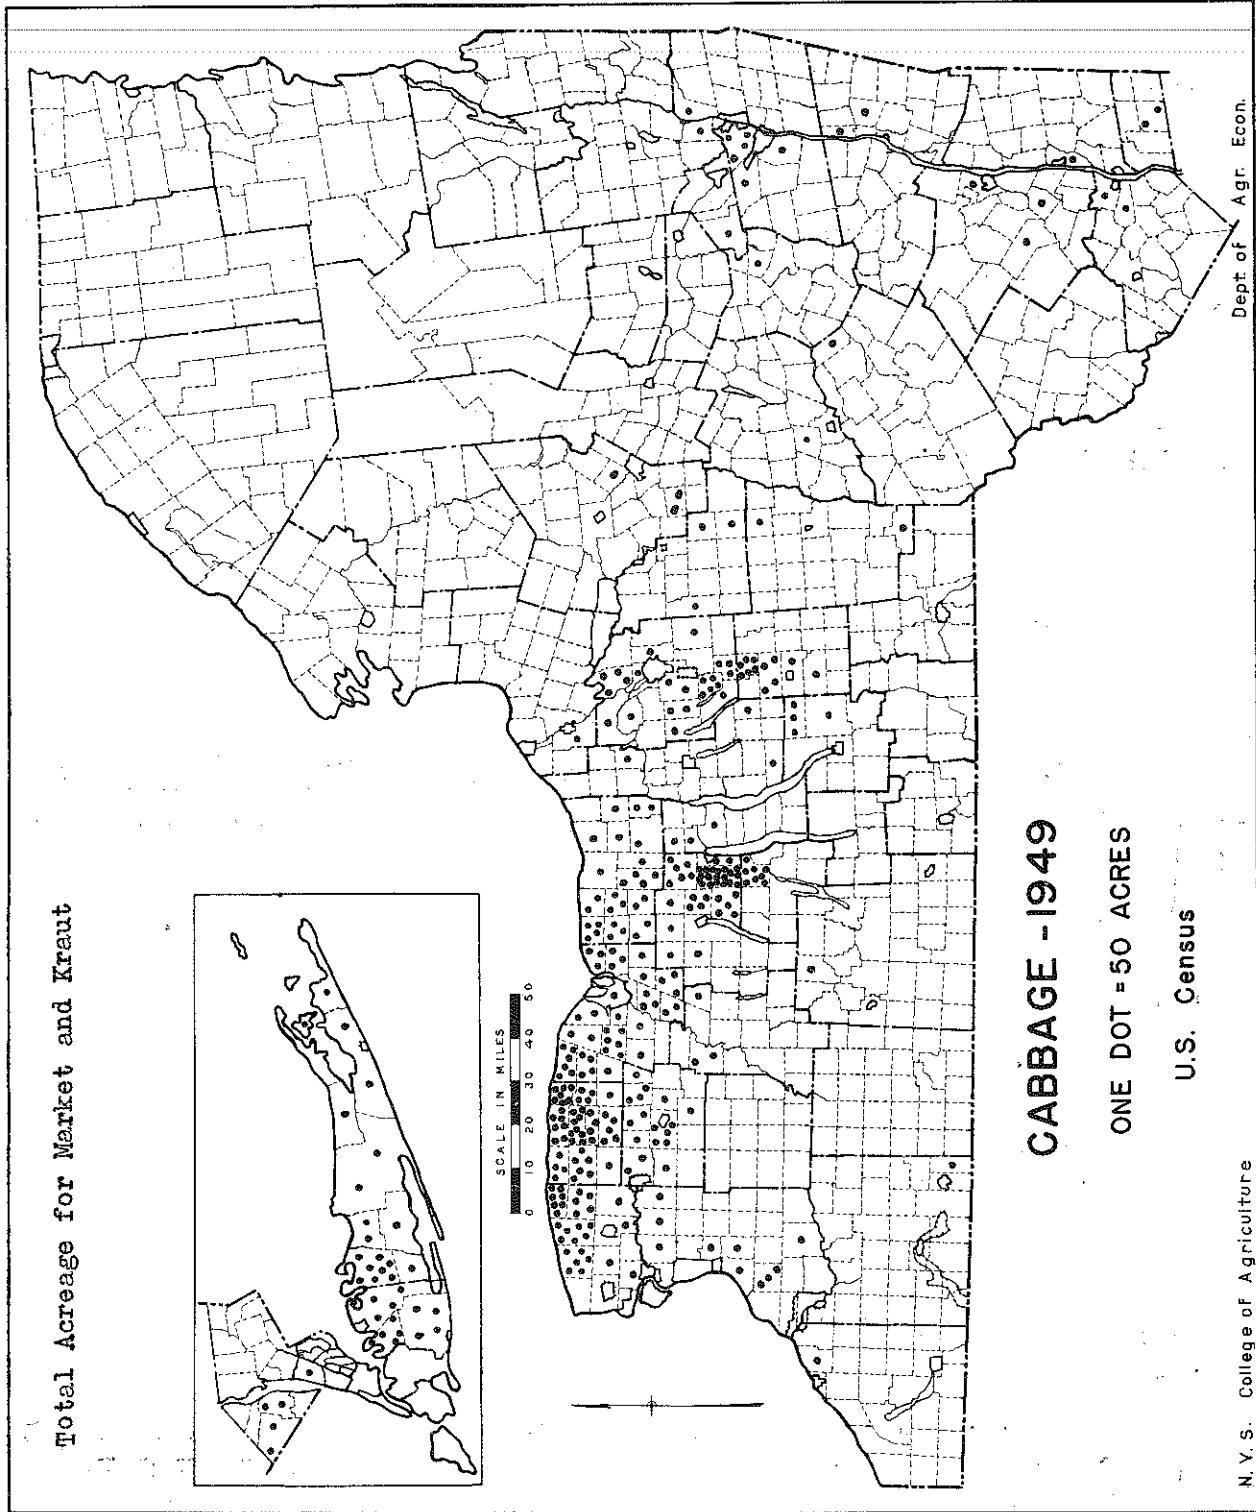

The most intensive cabbage producing area is in Ontario County. In this area several large sauerkraut plants cut cabbage and make sauerkraut. Cabbage for market and for kraut is raised extensively in the counties along Lake Ontario. Cabbage provides a cash crop for many fruit growers. About 29% of the acreage of cabbage in New York during the ten-year period from 1942-51 was used for manufacturing sauerkraut.

Cabbage has been an important cash crop on western New York farms for many years. Five-year interval averages from 1918-1951 show the acreages to vary from about 24,000 to 34,000 a year.

A.E. 951

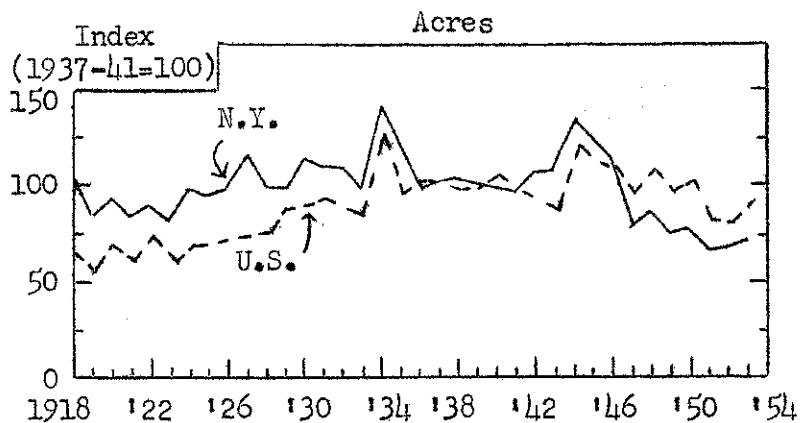

-31-

CABBAGE

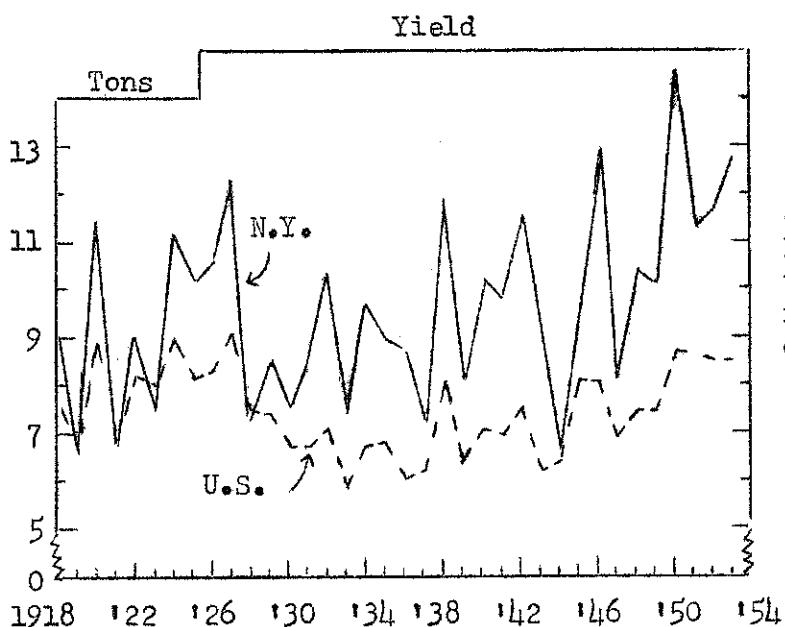

CABBAGE

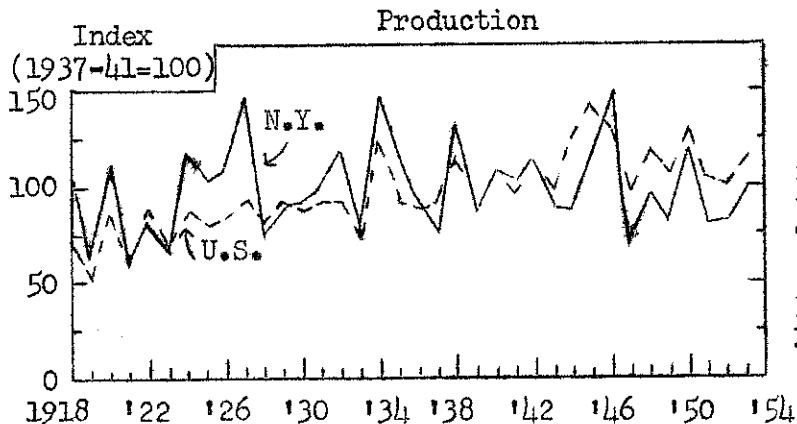

FOR MARKET AND SAUERKRAUT

The combined acreage of cabbage for market and for sauerkraut shows a long-time trend of a gradual increase from 1920 to about 1940 and a gradual decline during the next 15 years. New York shared in the same trend with a little more indication of gradual decline in the total acreage of cabbage from about the mid-1940's to 1953.

The U. S. average yield of all cabbage tended to decline from the late 1920's to the mid-1930's and then improved somewhat over the next 20 years. A similar trend occurred in New York.

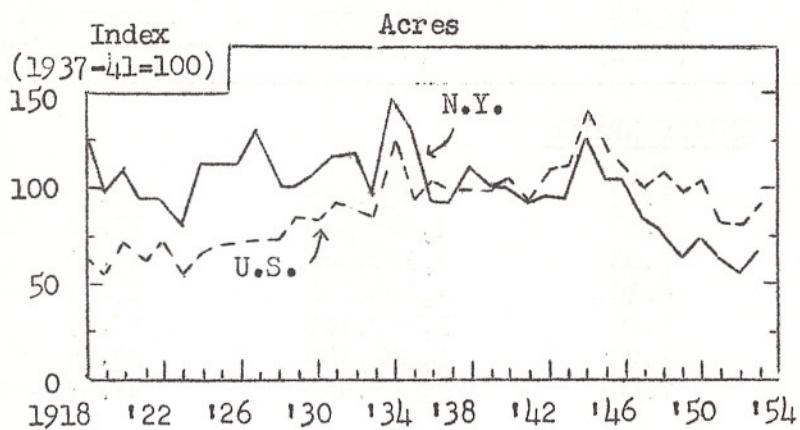

The total production of cabbage in the United States increased gradually over a period of 25 years. The trend in New York was for less increase or a more nearly constant production through a period of 20 years.

CABBAGE

FOR MARKET

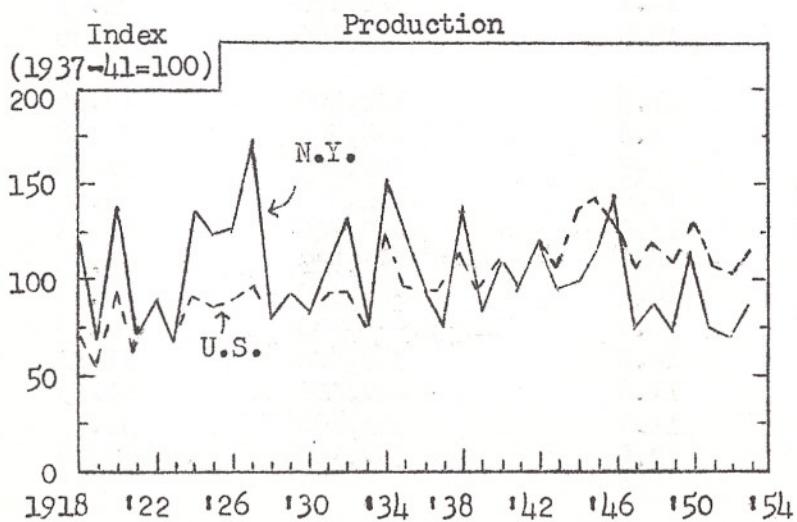

Market cabbage acreage for the United States increased from 1918 to 1944 and declined during the next ten years but not as much as for New York State.

The New York acreage of cabbage for fresh market sale fluctuated from year to year but showed little trend from 1918 to the end of World War II. Following the War the acreage of market cabbage declined to about 60% of that reported for the prewar years.

The long-time trend in the yield of market cabbage in the United States indicates a gradual decline from the 1920's to the 1930's and then some increase during the next 20 years.

The average yield of market cabbage in New York is somewhat above the United States average. Market cabbage yields tended upward from 1930 to 1950.

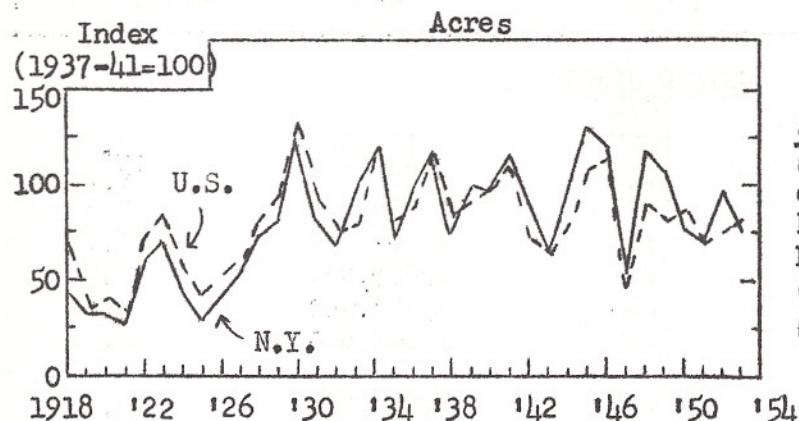

The U. S. production of market cabbage increased gradually from 1920 to the mid-1940's. Cabbage production tended to level off during the last part of the 1940's and the early 1950's.

CABBAGE

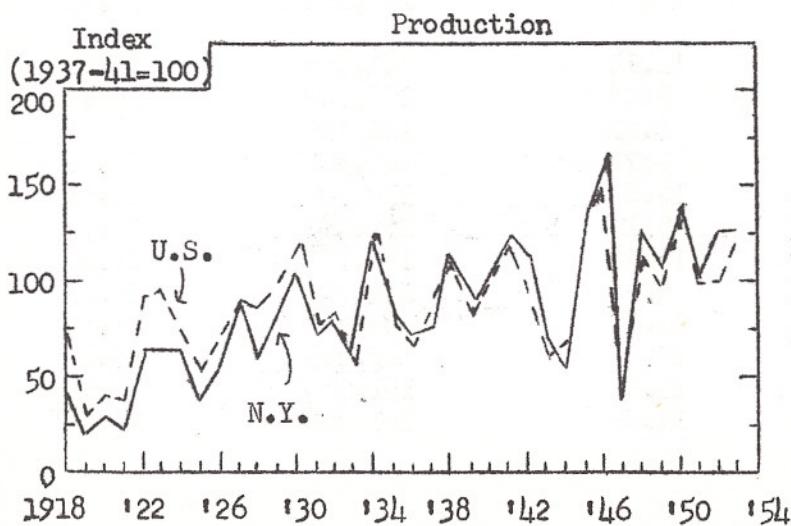

FOR KRAUT

About 25% of the New York acreage of cabbage is used for sauerkraut and more than one third of the U. S. acreage of cabbage for kraut is produced in New York State. From 1930 to 1953 the acreage of cabbage for kraut tended to decline gradually.

The yield per acre of cabbage for processing tended to increase gradually from the early 1930's to the early 1950's.

The production of sauerkraut has expanded gradually over the years. Production in New York amounts to about one half of the total sauerkraut manufactured in the United States.

CANTALOUP

Most of the cantaloup produced in upstate New York is grown in the areas near the larger centers of population - in the Capital District around Albany, north of Syracuse, around Rochester, and in Niagara and Erie Counties near Buffalo.

A.E. 951

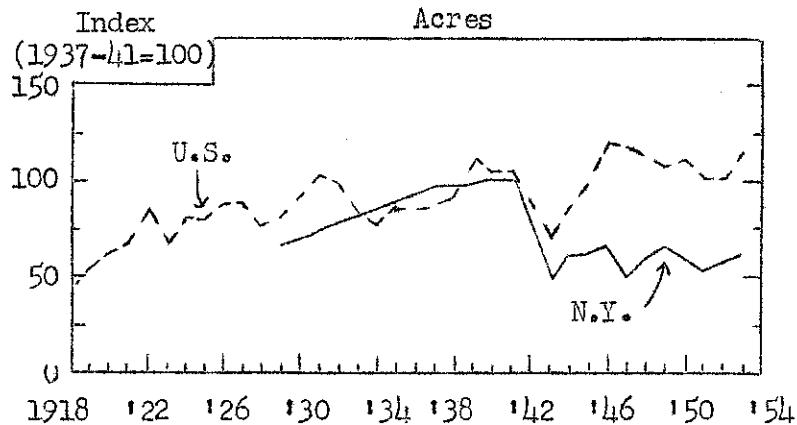

-39-

CANTALOUP

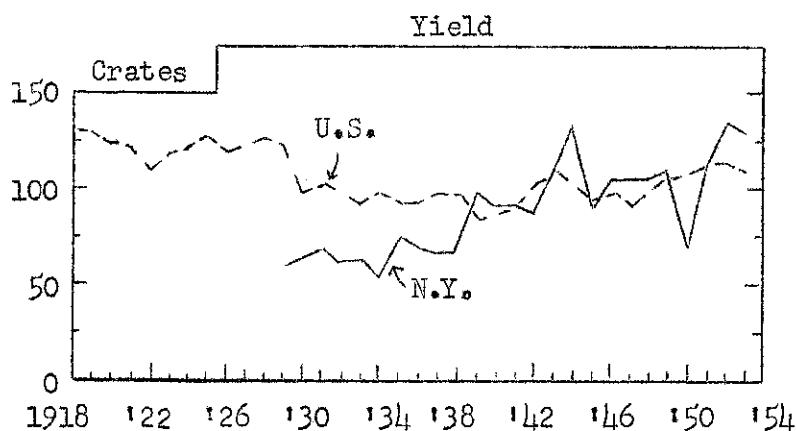

CANTALOUP

FOR MARKET

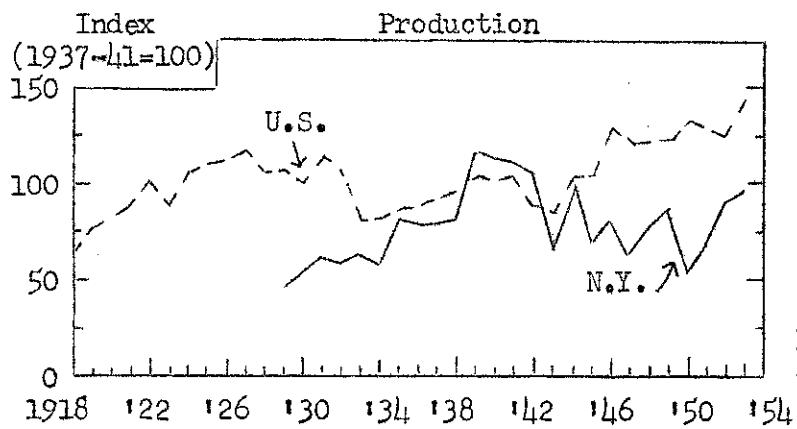

The U. S. acreage of cantaloups has increased gradually over a 35-year period.

In New York, cantaloup acreage expanded from 1928 to the beginning of World War II. For the ten-year period beginning with 1943, acreage in New York was about 60% of that in the prewar years (1937-41).

The U. S. average yield per acre of cantaloup declined gradually from about 1918 to about 1940. During the next ten years yield showed a slight increase.

In New York the acre yield of cantaloup tended to increase from the early 1930's to the early 1950's.

The production of cantaloup has tended to increase in the United States over a period of 35 years. The production was relatively high in the 1920's, low in the 1930's and again high in the late 1940's and early 1950's.

Production was highest in the late 1930's and tended to decline during the next 15 years in New York.

CARROTS

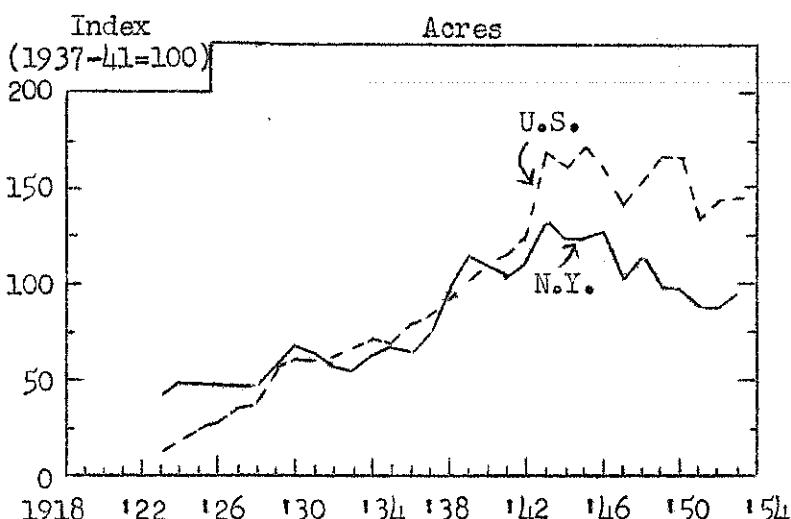

Carrots are produced on both upland and muck soils. The upland area of greatest concentration is in Ontario County in the section where beets are produced for canning. Rather extensive acreages of carrots are also produced in the areas of muck soils which also grow lettuce, celery and onions. This explains the concentration in the Orange County muck section of southeastern New York and in the muck areas of Madison, Oswego, Wayne, and Genesee-Orleans Counties.

The acreage of carrots in the five-year period, 1947-51, (4,560) was more than double the acreage in the five-year period, 1923-27 (2,152).

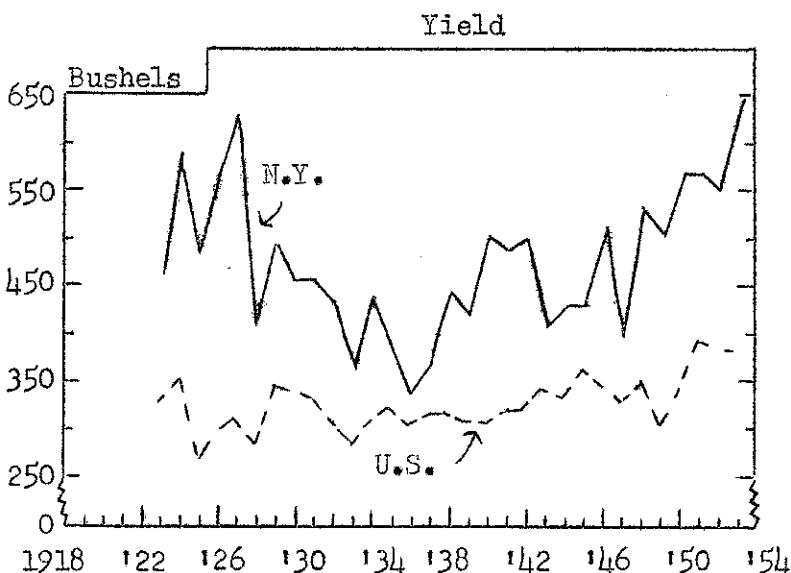

CARROTS

FOR MARKET*

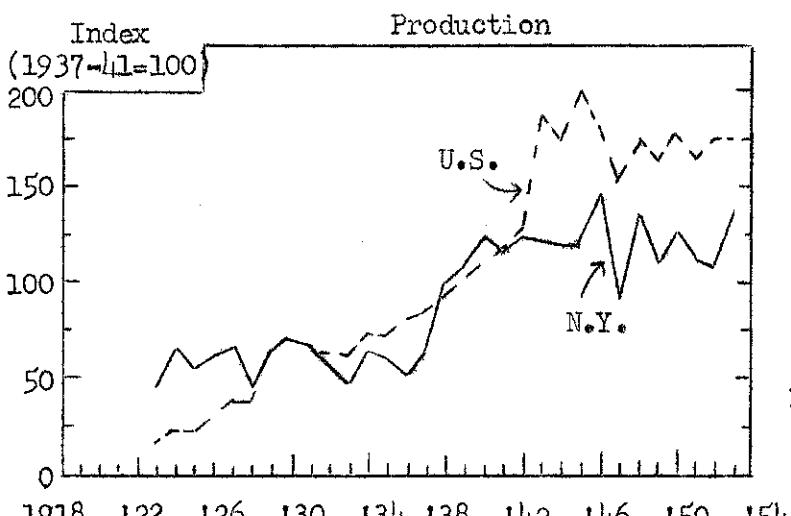

The expansion in carrot acreage in the United States from 1921 to 1951 was larger than for most vegetable crops.

In New York, the acreage increased from 1921 to 1943 and declined somewhat over the next ten years. A considerable portion of the New York carrot acreage is processed.

The U. S. average yield of carrots increased slowly during the past 30 years. In New York yields tended to decline to the mid-1930's and then showed substantial increase. The yield reported for 1953 was the largest on record for New York.

The production of carrots has shown a surprisingly constant increase over the past 30 years. In the early 1940's it was about four times that of the late 1920's.

In New York production expanded rapidly during the late 1930's and early 1940's and then remained fairly constant for the next ten years. A substantial portion of the New York carrot crop goes to processors.

* Includes some production used for processing.

CAULIFLOWER

The most intensive production area for cauliflower is on Long Island particularly the "Northern Fork." The crop in this area is harvested during the period from late September to December and is widely distributed throughout the eastern part of the United States.

Another important producing area is in the Catskill Mountain section, Delaware and Schoharie Counties. This crop comes to market during August and early September.

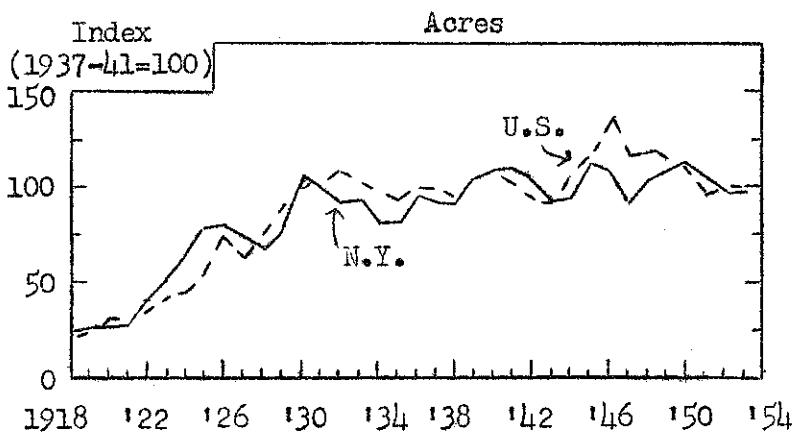

Cauliflower also is raised in the market garden sections around the larger centers of population.

By early 1950's an increasing quantity of cauliflower was going to processors for freezing.

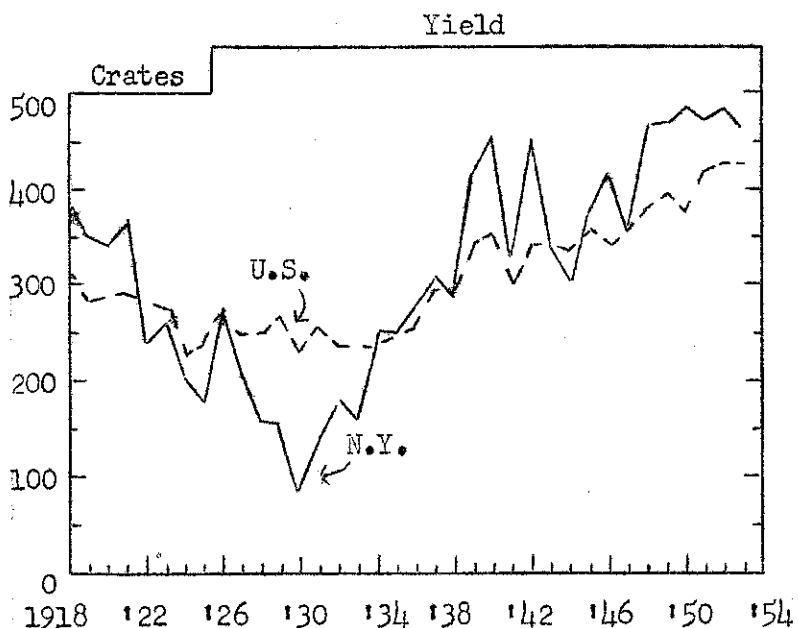

CAULIFLOWER

FOR MARKET*

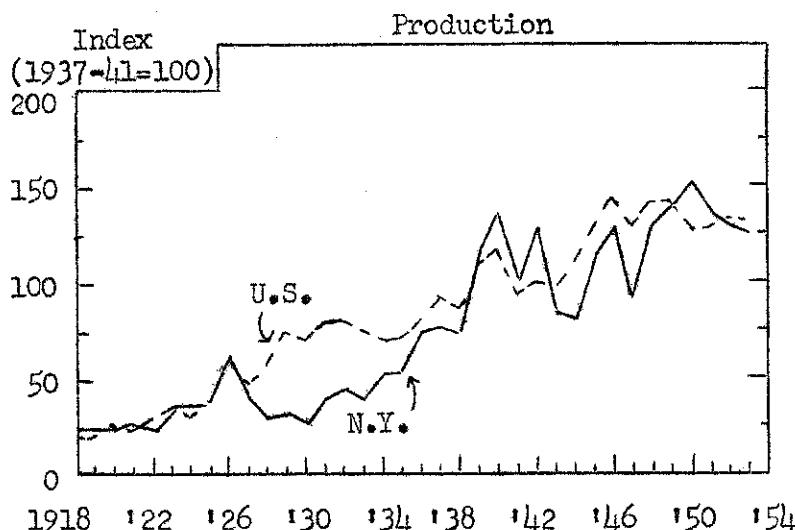

The trend in cauliflower acreage in the United States rose sharply upward from 1918 to 1930. The increase from 1930 to 1953 was more gradual.

The trend in acreage expansion in New York was similar to that for the United States. Long Island is the most important producing cauliflower area. The second most important area is in the Catskill Mountain section.

The average yield of cauliflower in the United States tended to decline from 1918 to the mid-1930's. During the next 20 years yield improved rather consistently.

In New York cauliflower yields declined rather sharply from 1918 to 1930 and then increased as sharply during the next five years. Average yields in New York have been somewhat higher than the average for the United States during the past decade.

U. S. production of cauliflower has continued to expand rather steadily over a period of 35 years.

In New York production lagged in the late 1920's and early 1930's and then moved upward in line with the trend for the United States.

* Includes some production used for processing.

CELERY

Nearly all of the celery raised in New York State is to be found on muck soil. This explains the heavy concentration in Orange County in southeastern New York and in the muck areas of Wayne County. Celery acreage in New York has been declining and the quantity represented on the accompanying map is probably only about one half the acreage reported by farmers around 1930.

A.E. 951

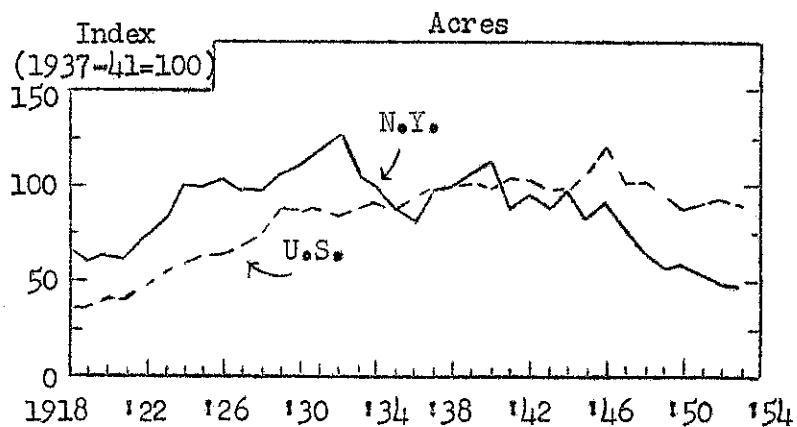

-51-

CELERY

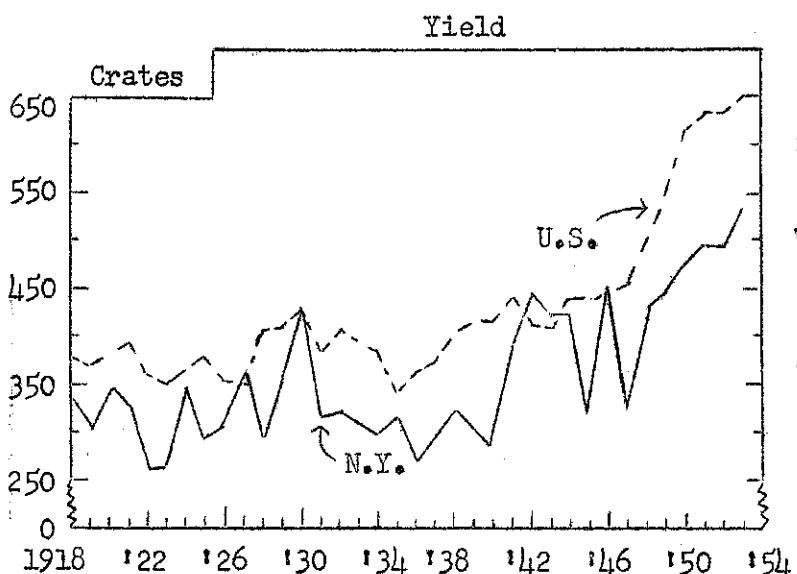

CELERY

FOR MARKET*

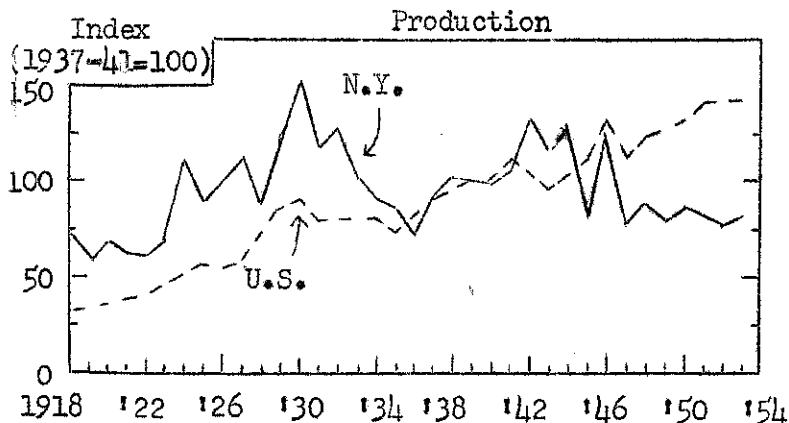

The United States acreage of celery expanded rather steadily from 1918 to 1946, then declined gradually over the next five years.

In New York celery acreage reached its peak in 1932 and tended to decline over the next 20 years.

Relatively little change occurred in the average yield per acre of celery for the United States from 1918 to about 1940. Following World War II celery yields increased sharply.

In New York the yield per acre of celery changed but little during the first 20 years but improved somewhat during the last ten years shown in the graph.

The U. S. production of celery has risen rather constantly over a 35-year period.

In New York celery production reached its peak in 1932, declined until 1936, increased again to the early War years, and declined further with little change in the early 1950's.

* Includes some production used for processing.

SWEET CORN

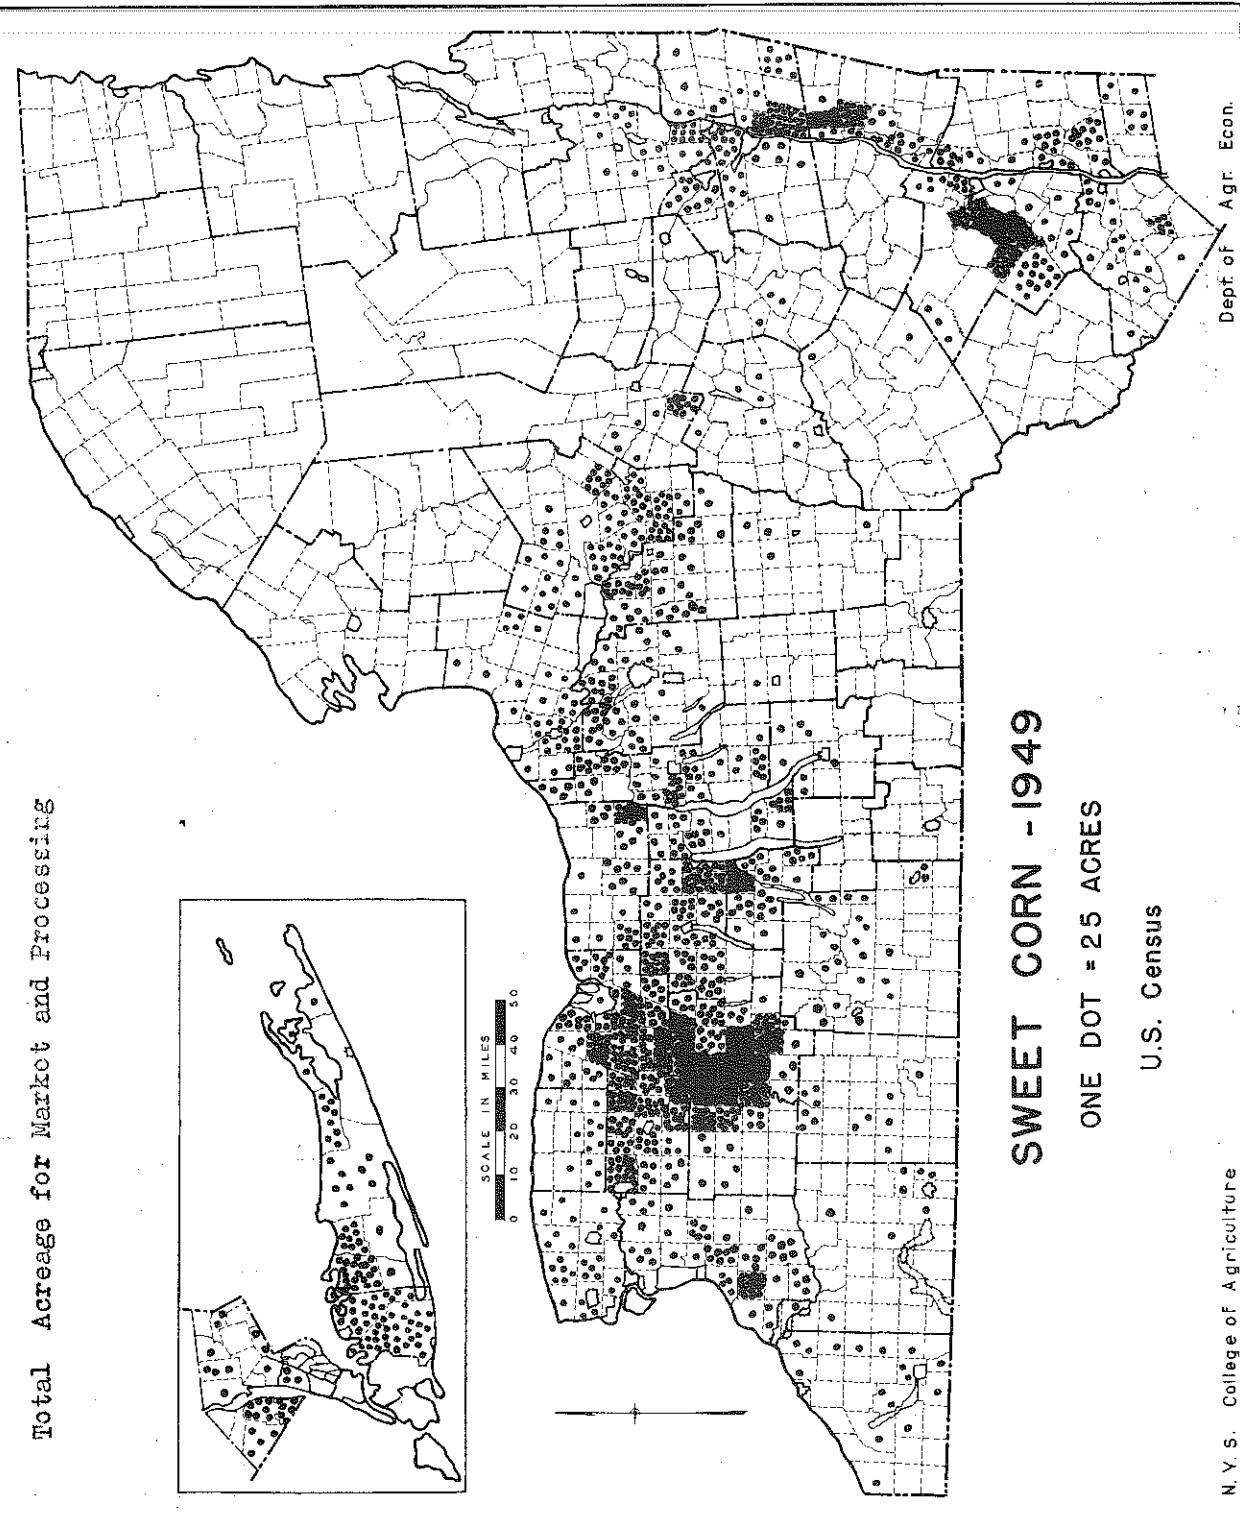

The accompanying map represents the location of the acreage of all sweet corn which for the ten-year period 1942-51 was better than 48,000 acres. About 52% of this acreage was produced for canners and freezers. The sweet corn acreage on Long Island and in the Hudson Valley goes very largely to the fresh market. Most of the acreage through the central counties of New York State goes to canners and freezers.

U.S. Census

SWEET CORN

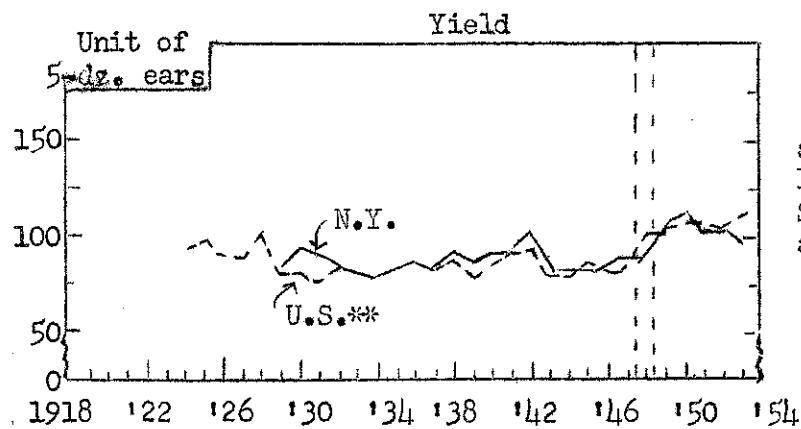

FOR MARKET

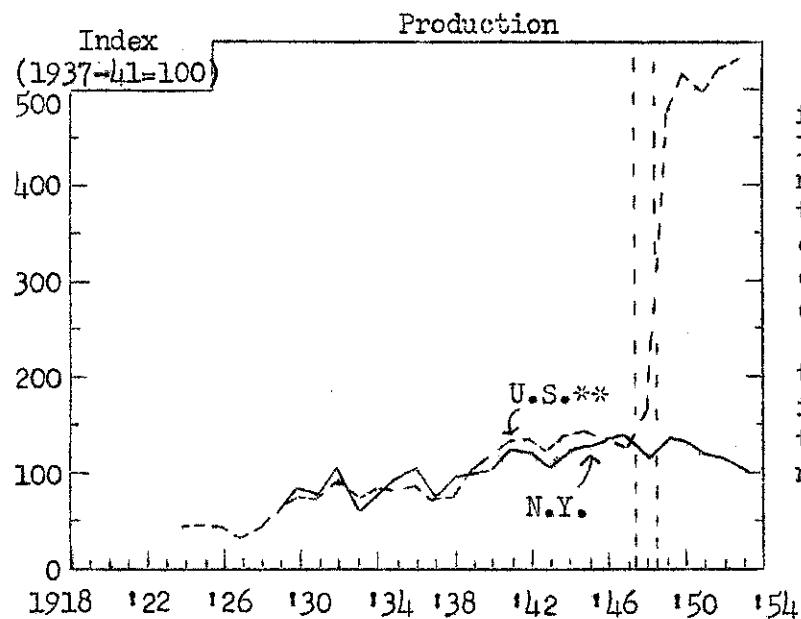

Note double scale used.

The U. S. acreage of sweet corn for market increased gradually from 1924 to 1946. A very sharp increase occurred immediately after World War II as the production of sweet corn in Florida and other southern states was reported for the first.

In New York the upward trend in sweet corn acreage was similar to that for the country as a whole until the postwar years when acreage declined somewhat.

The average yield of sweet corn showed little change during the 1920's, 1930's and early 1940's. Some improvement in yield occurred after World War II.

The production of sweet corn for market increased from the mid-1920's rather steadily until the mid-1940's. A sharp increase in total production occurred with the expansion in sweet corn from southern states for sale during the early spring months.

In New York sweet corn production reached its upward peak immediately after World War II and total tonnage tended to decline over the next eight years.

** U.S.--see table on next page for states included in U.S. total.

Note double scale used.

* Prior to 1948 the U.S.D.A. reported only three states, N.J., Pa., and N.Y. with sweet corn for market; for 1948 Fla. and Mass. also were reported; from 1949 to date 26 states were reported as having sweet corn for market.

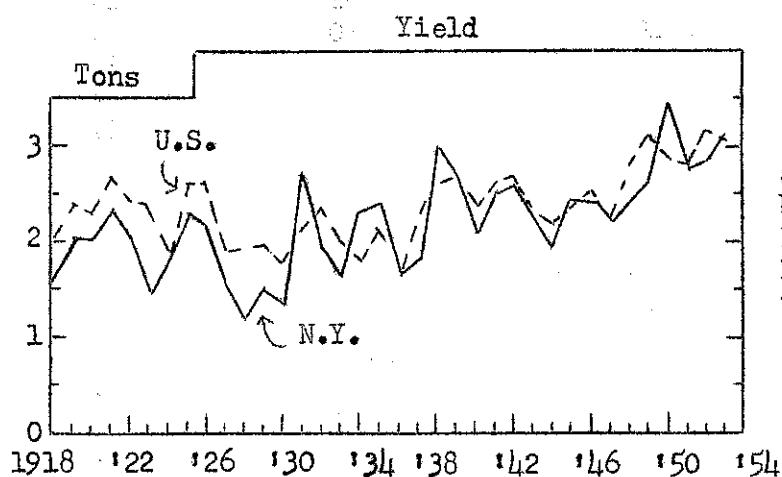

SWEET CORN

FOR PROCESSING

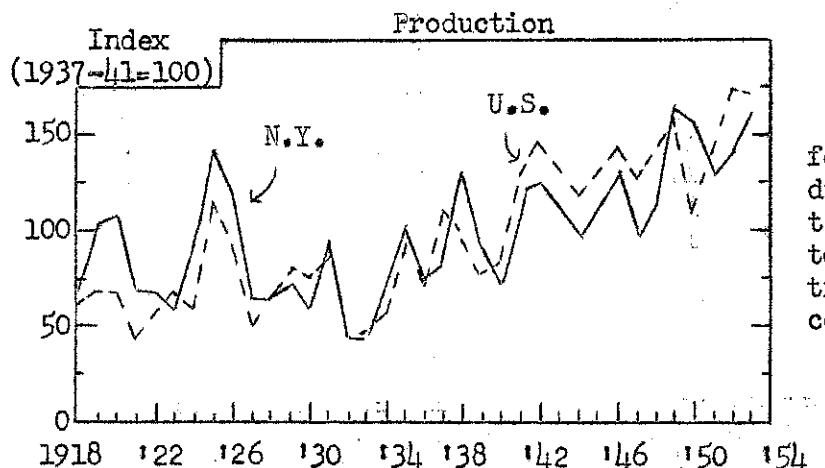

U. S. acreage of sweet corn for canning and freezing fluctuated sharply from year to year but showed a steady increase from the 1920's to the 1940's. The acreage remained fairly constant during the ten-year period following the mid-1940's.

The New York acreage trend is similar to that for the United States except that the acreage was larger in early years, relatively low in the mid-1930's and fairly constant during the last ten-year period.

The average yield per acre of sweet corn for processing changed but little during the 1920's and 1930's. Some tendency toward higher yields per acre occurred in the early 1950's.

The production of sweet corn for canning was relatively constant during the 1920's and until about the mid-1930's. From the mid-1930's to 1953 there was a steady upward trend in the production of sweet corn for canning and for freezing.

A.E. 951 - Cucumber acreage in New York State - 60 -

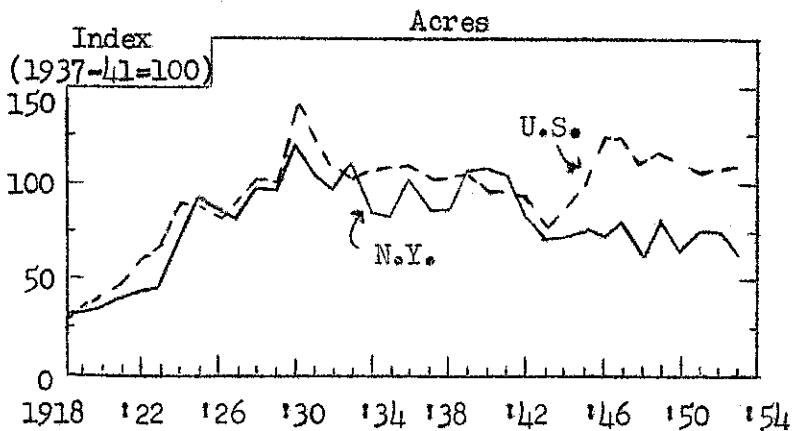

CUCUMBERS

The annual average acreage of cucumbers in New York is around 4,700. About one fourth of this acreage goes to pickle manufacturers, the other is sold in the market as fresh cucumbers throughout the harvest season. Orleans County leads the other areas. Much of this cucumber acreage is raised on fruit farms.

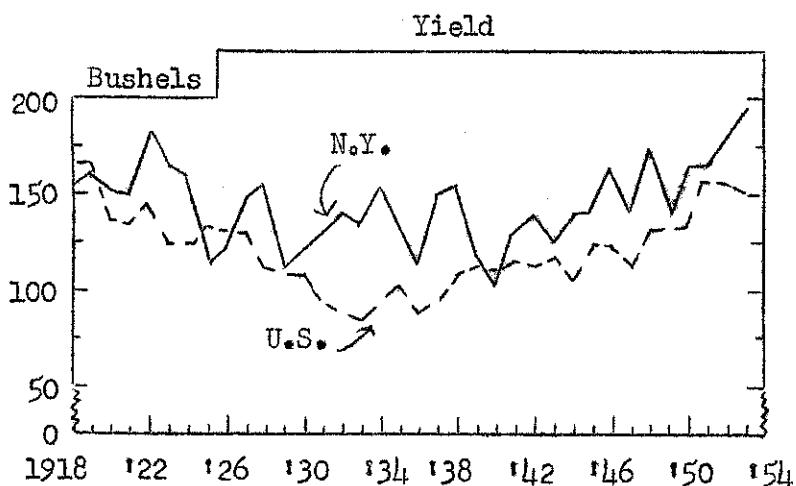

CUCUMBERS

FOR MARKET

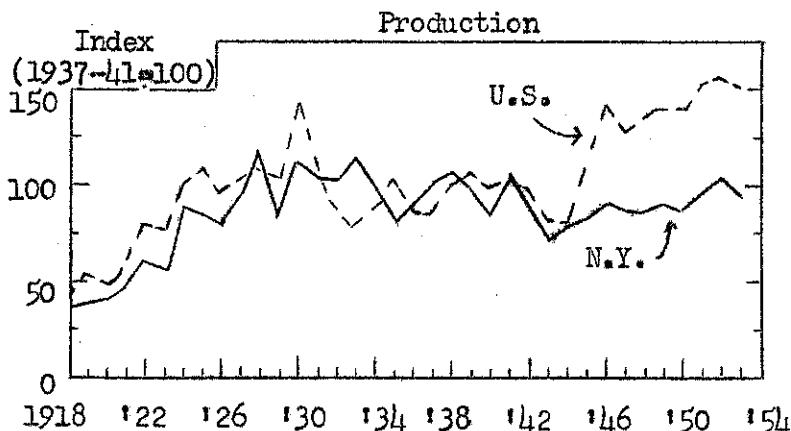

The U. S. acreage of cucumbers for market reached its peak in 1930 following a sharp increase during the previous decade. For the 20-year period following 1930 acreage showed relatively little change.

In New York, the acreage trend was similar with more of a tendency for a reduction of acreage of cucumbers for market over the past two decades.

The average yield of cucumbers for market declined from 1918 to about mid-1930's and then showed a similar trend upward. The average for the years of 1951, 1952 and 1953 was about the same as at the end of World War I.

The New York trend in yield was about the same as for the U.S.

The U. S. and New York production of cucumbers increased sharply from 1918 to about 1930. Total production showed no increase during the late 1930's and early 1940's but was considerably higher following World War II.

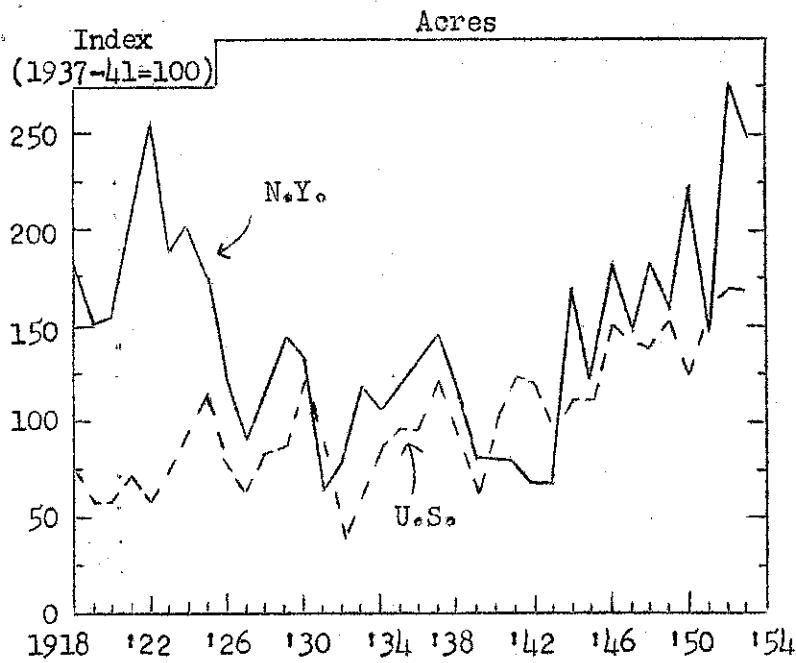

In New York the trend was similar to that for the United States except that production following World War II was about the same as in the previous decade.

CUCUMBERS

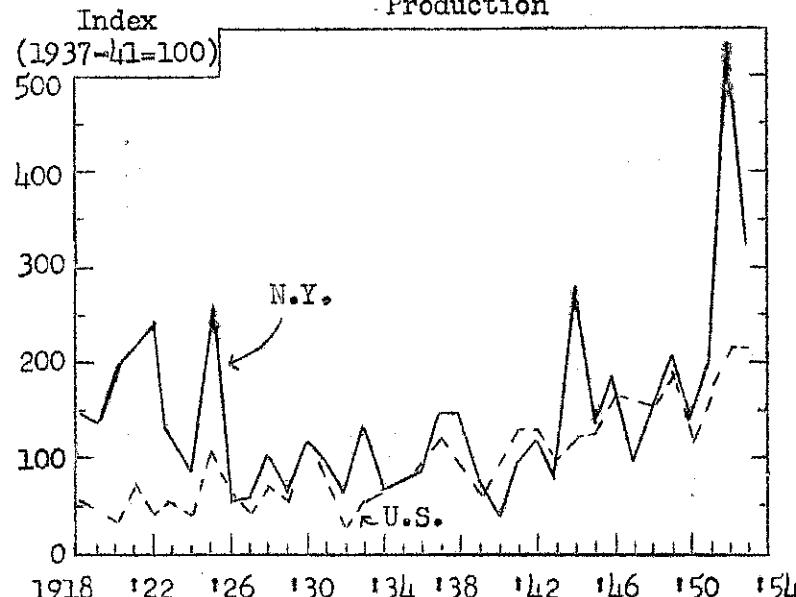

FOR PICKLES

The U. S. acreage of cucumbers for pickles has increased gradually over a period of 35 years. In New York, the acreage declined from 1920 to the early 1940's and regained the losses by the early 1950's.

Over a 35-year period there has been only a gradual increase in the yield per acre of cucumbers for pickles. For the United States the five-year average, 1947-51, was 79 bushels compared with a five-year average, 1918-22, of 55 bushels. In New York, the average yield for the last five years (1947-51) of 73 bushels was slightly less than the average during the first five years, 1918-22 (77 bu.). Yields per acre in New York varied widely from year to year.

The production of cucumbers for pickles has increased moderately over a 35-year period. In New York much higher production, mostly as a result of increased acreage, occurred during the years 1952 and 1953.

LETTUCE

Some market garden lettuce is raised on farms on western Long Island. This crop is sold in New York City. Most of the lettuce raised for commercial shipment is in the muck areas in Orange County and in Oswego County. Some also is produced in the Genesee-Orleans muck section.

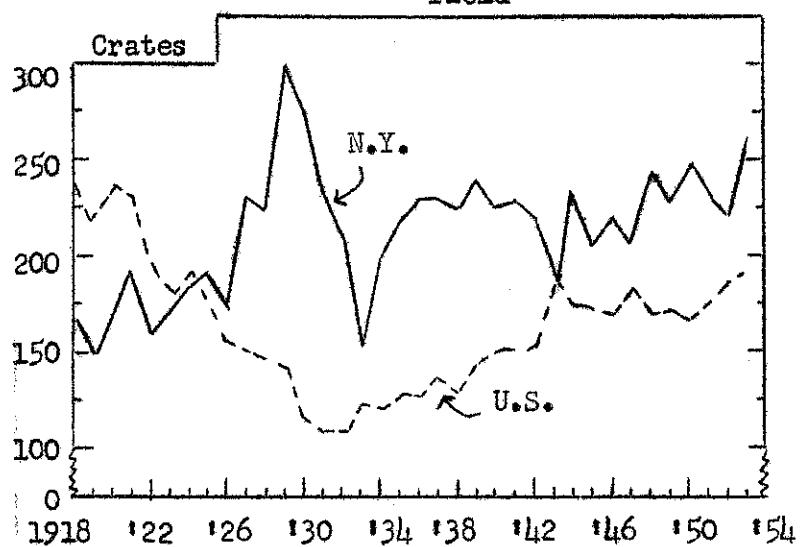

LETTUCE

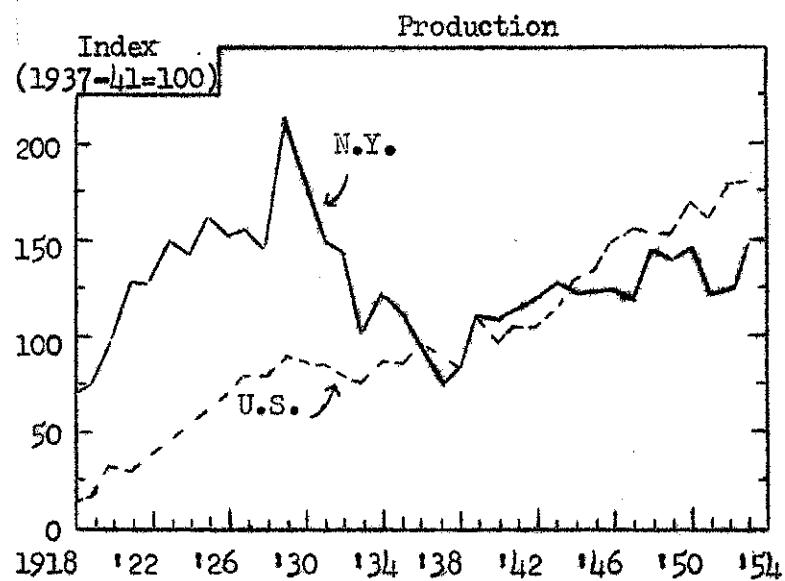

FOR MARKET

The U. S. acreage of lettuce increased rapidly from 1918 to 1930 as refrigerated transportation became available for moving lettuce from the Pacific coast to eastern markets. Little change occurred in lettuce acreage over the next ten years. Some further expansion began in 1940 and continued through the decade. In New York, lettuce acreage declined as acreage expanded in other parts of the country. Little change has occurred in the acreage of lettuce during the decade of the 1940's.

The average yield per acre of lettuce declined from 1918 to 1932 and then followed a gradual upward trend. In New York the average yield of lettuce has continued to increase gradually over a period of 35 years with some sharp increases and sharp declines.

The over-all production of lettuce has shown a rather continuous upward trend over a period of 35 years. The rapid increase in production during the 1920's was followed by several years with relatively little change of total output and then a continuation of a steady increase to 1953. In New York, lettuce production reached its peak in 1928, declined to 1937 and then increased over the next 15 years.

ONIONS

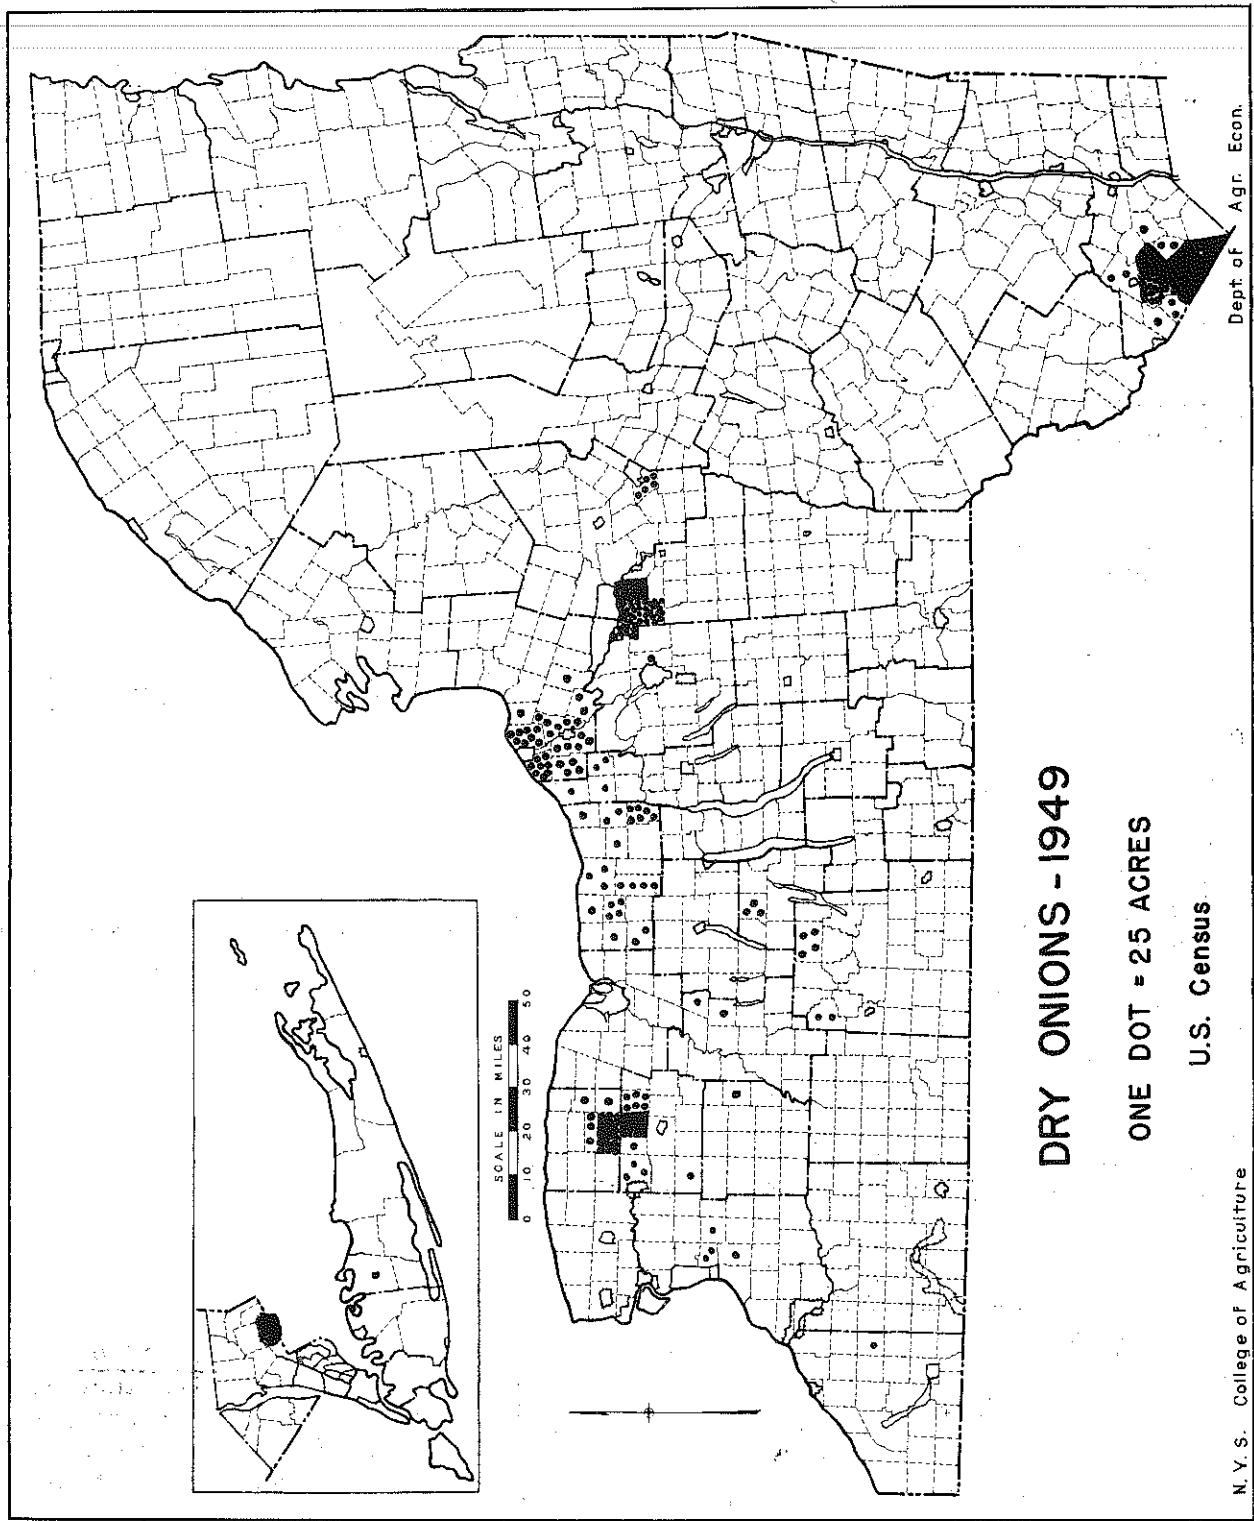

Most of the onions produced in New York State are raised on the muck lands with heavy concentration in Orange, Madison and the Genesee-Orleans muck areas followed by onions produced on muck in Oswego and Wayne Counties.

For about 15 years following 1937 the annual average acreage was around 15,000 acres.

A.E. 951

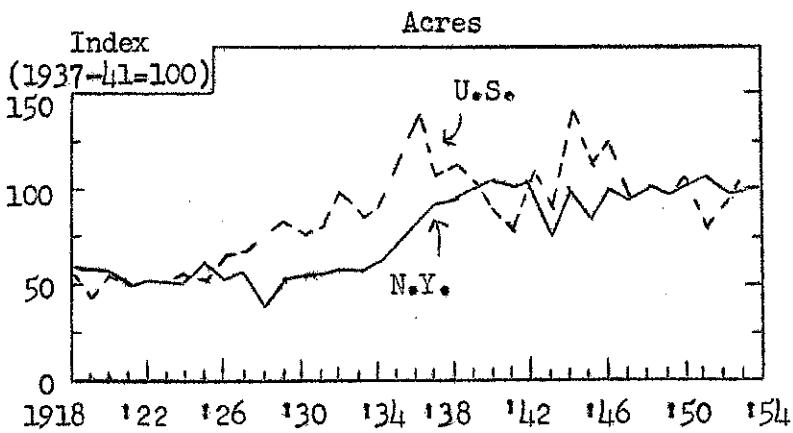

-71-

DRY ONIONS

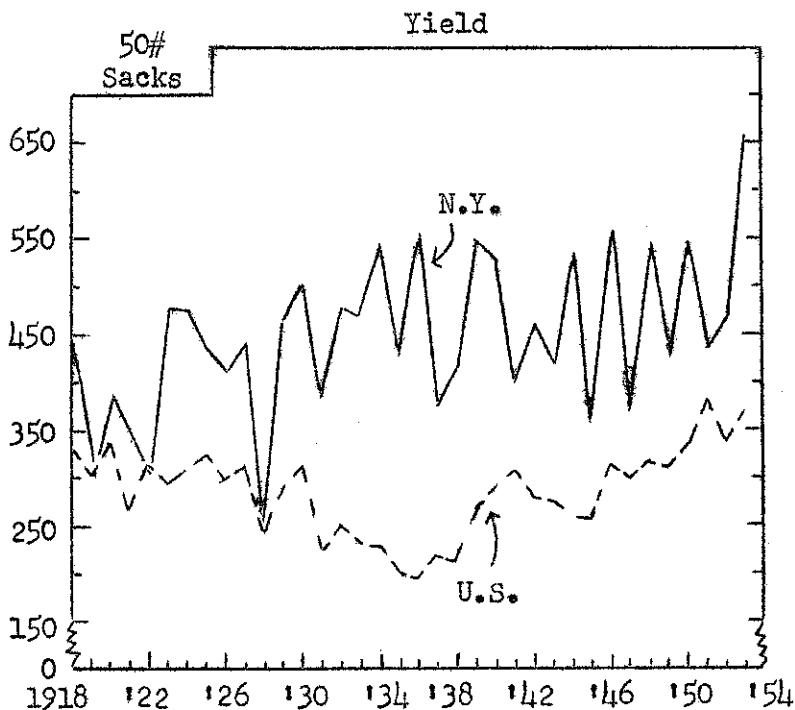

ONIONS

FOR MARKET *

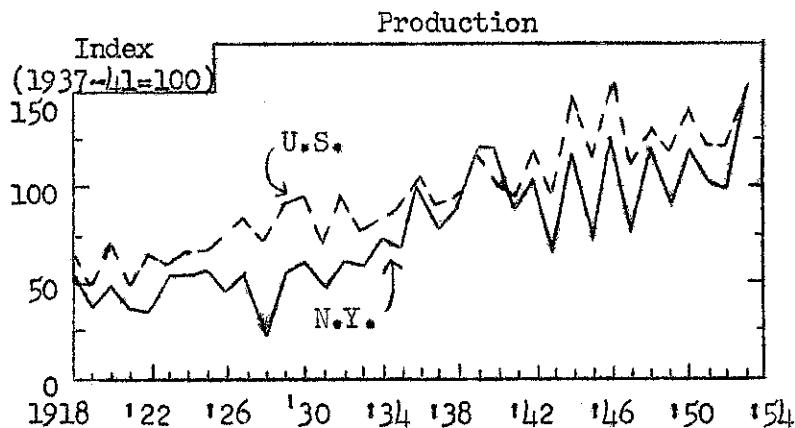

The U. S. onion acreage increased from about 63,000 acres in 1920 to more than double that acreage in 1936. There then followed some decline in onion acreage and another peak of 160,000 in 1946. For the past 20 years the acreage of onions has fluctuated rather violently around 125,000 acres.

The trend in New York has been similar to that for the country as a whole.

The average yield of onions in the United States continued to decline from 1918 to the mid-1930's and then recovered the losses with yields above those of the earlier period in the first years of the 1950's.

In New York, yields have fluctuated widely from year to year but have tended to increase over the 35-year period.

The total production of onions in the United States increased rather steadily over the 35-year period. A similar trend is shown for the production of onions in New York.

* Includes some production used for processing.

GREEN PEAS

About 95% of the pea acreage shown on the accompanying map of New York State produced peas for freezing and canning. The rather large fresh market pea acreage of the 1920's had almost disappeared by 1950.

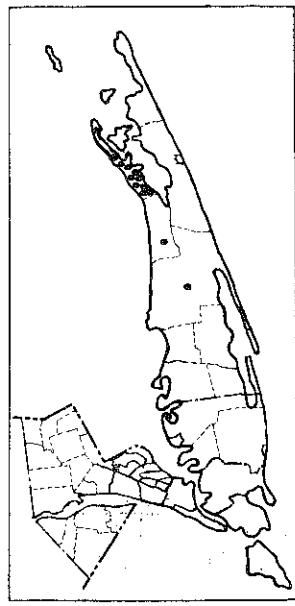

Central and western New York farmers raised most of the peas for processing with the heaviest concentration of acreage in Genesee, Wyoming, Livingston and Orleans Counties.

GREEN PEAS

FOR MARKET

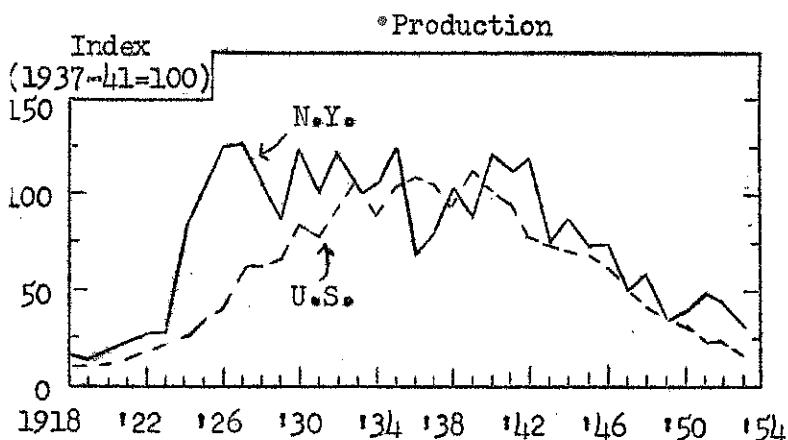

The U. S. acreage of peas for market increased rather steadily from 1918 to 1936 and then followed a decline which brought the acreage back by 1953 to about where it was in 1920.

In New York the peak of market pea acreage occurred in 1926 at 50% above the average of the prewar years, 1937-41. By 1951 the acreage had dropped to about the level of 1920.

The average yield per acre of peas for market gradually increased throughout the 35-year period. Yields in New York increased somewhat more than the average for the country as a whole but showed wide variations from year to year.

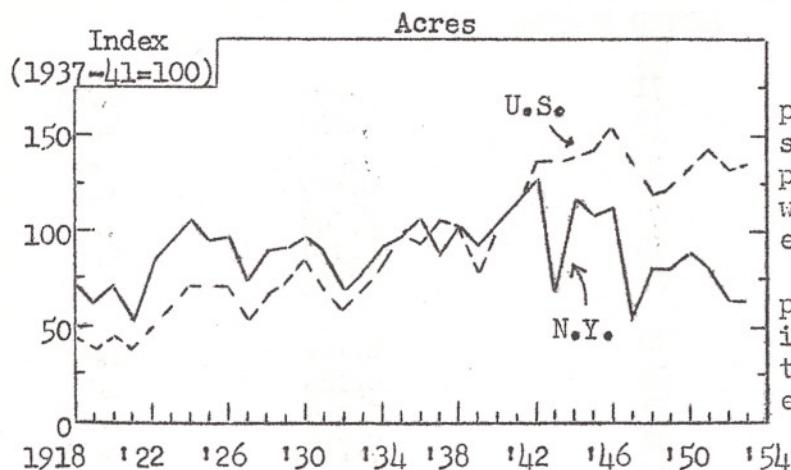

Production of peas for market increased from 1918 to the mid-1930's and then fell off gradually by 1950 to about the level of 1924.

GREEN PEAS

FOR PROCESSING

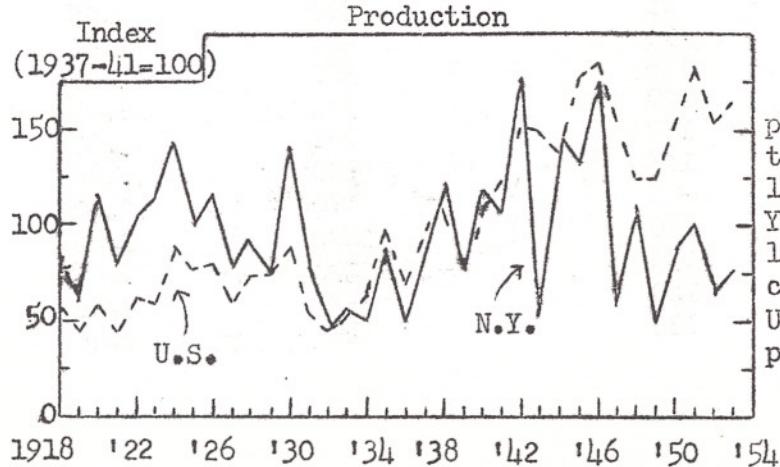

The U. S. acreage of peas for processing has shown a rather steady increase over a 35-year period. The peak acreage of 1946 was not repeated during the next eight years.

In New York the acreage of peas for processing continued to increase somewhat from about 1920 to the early 1940's and then tended to fall off.

The U. S. average yields of peas for processing declined from 1918 to the early 1930's then regained the loss by 1950. A similar trend occurred in New York State with the average yield per acre lagging below the increase for the United States during the 1940's and the early 1950's.

Total production of peas for processing expanded slowly during the 1920's, sharply during the late 1930's and early 1940's. In New York, the production during the late 1940's and early 1950's was considerably below that of the prewar years.

POTATOES

During the decade of the 1940's very substantial changes occurred in both the location of potato production and in the yield per acre. Some of these changes were induced by the need for food during the War and the high level of price supports for potatoes. Other economic factors also exerted strong influence on potato growers. The rapid rise in the cost of labor stimulated the mechanization of potato production. These specialized machines were expensive and neither suitable nor economically sound for growers customarily planting only a few acres. Steep and stony fields were quickly diverted to the production of other crops. Furthermore, the per capital consumption of potatoes continued the longtime decline.

The pie charts (Figure 2) show some of the overall effects of these changes from the five-year period before the War (1937-41) to the year 1948. In the pre-war years, the late potato crop, mostly harvested after the first of September, amounted to nearly three-fourths of the total potato production of the country. In 1948, this late crop was 71% and the crop from the intermediate and early areas was 29% of the total.

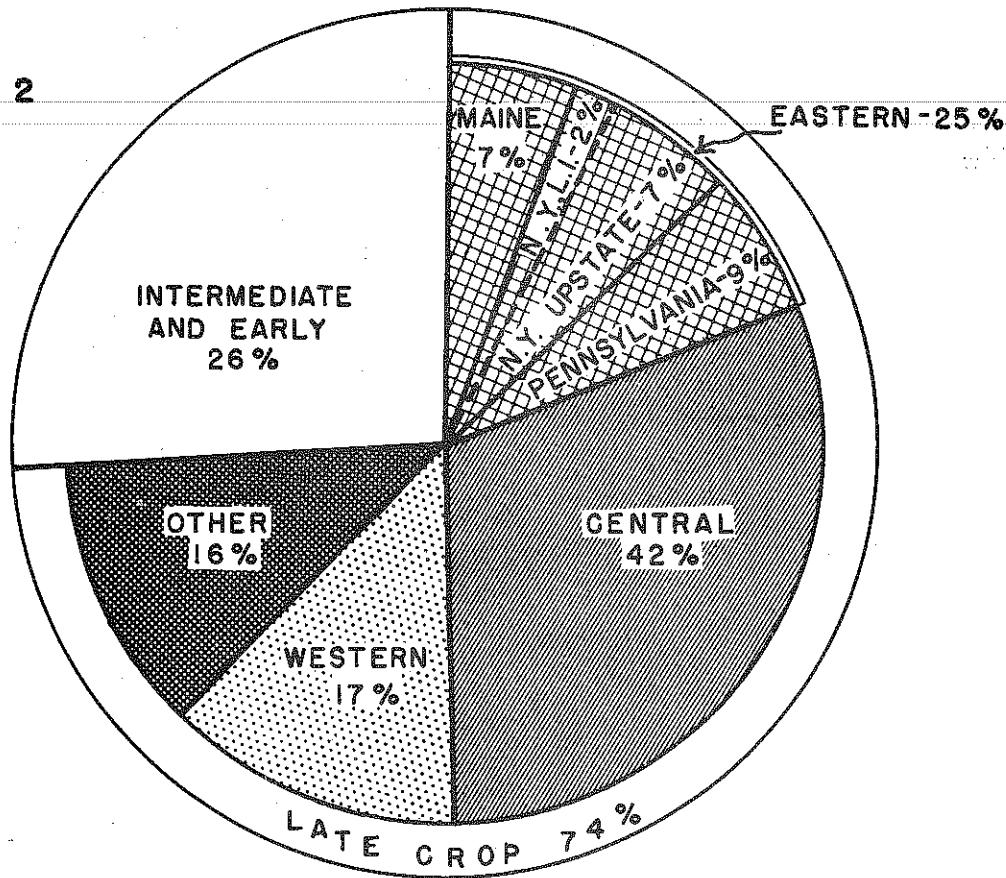

In the pre-war years, the Eastern area (Maine, New York, and Pennsylvania) produced 25% of the acreage, the Central States 42%, and the Western States 17%. In 1948, the Eastern States had increased to 30% of the total, the Central States had declined to 33%, and the Western States had increased sharply to 26%. The acreage of potatoes from the intermediate and early areas which amounted to 26% of the total in the pre-war years had risen to 29% in 1948. Since 1948, still further concentration of potato production has occurred. More of the potatoes are now grown in well-adapted areas where growers can get good yields and make efficient use of large specialized machinery.

Trends in acreage, yield, and production for the United States, the 29 late states, New York, Maine, Long Island, and Upstate New York are shown on the following pages. Commercial potato growers are still trying to find the most efficient ways of growing, harvesting, and handling their potato crop.

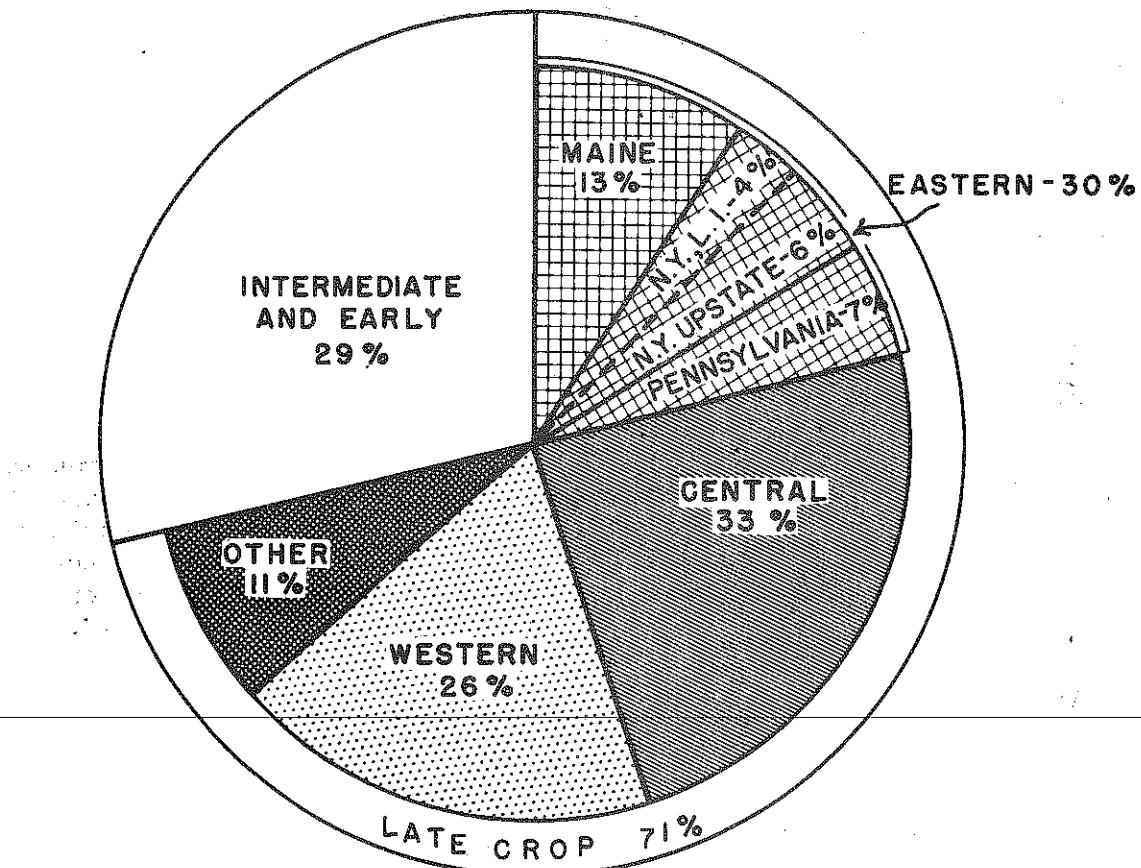

The yield per acre in these commercial areas is far above those on farms in less well-adapted situations.

POTATO ACREAGE 1937-41 AVERAGE

Figure 2

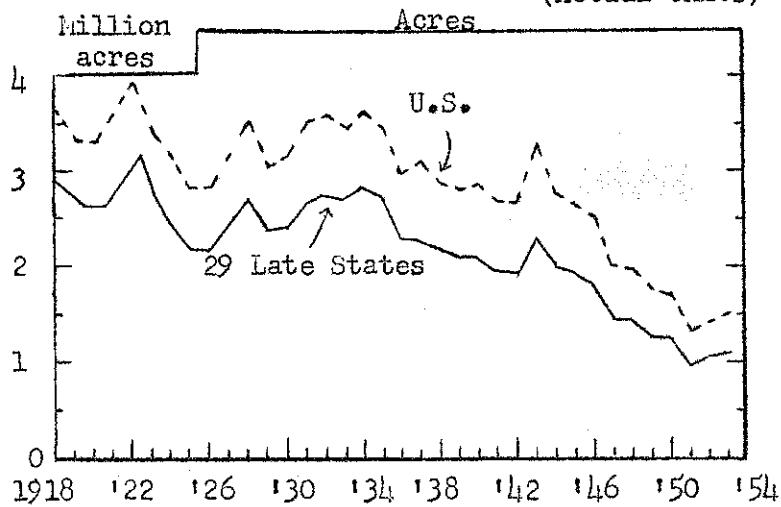

1948

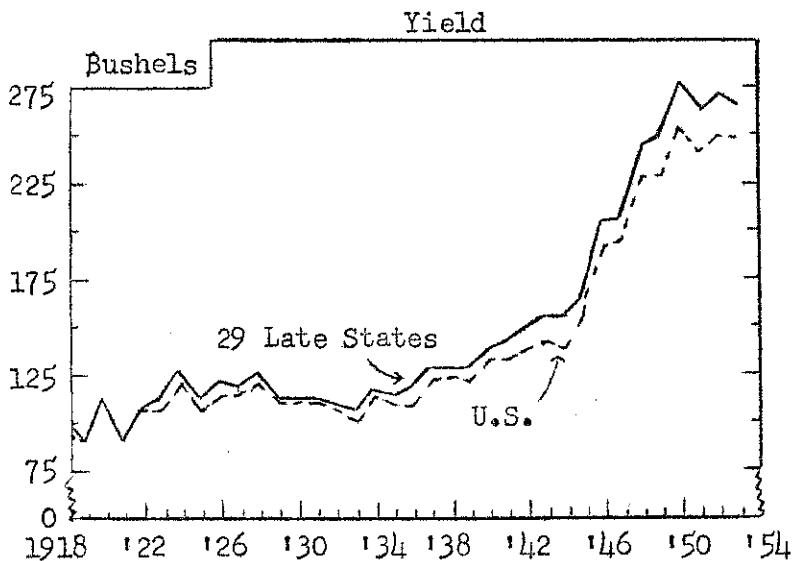

POTATOES

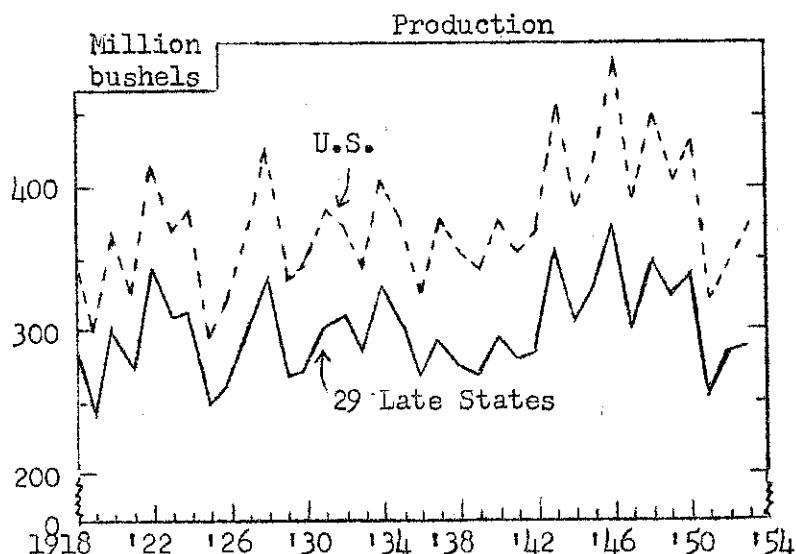

UNITED STATES AND 29 LATE STATES
(Actual Units)

Total acreage of potatoes, from 70 to 80 per cent of which was in the "late states", varied from 3 to $3\frac{1}{2}$ million acres from 1918 to 1935. Over the next 15 years acreage declined sharply reaching a low of 1.3 million in 1951.

Average yield per acre continued at around 115 bushels from 1920 to 1936, increased gradually from 1937 through 1945, and rose sharply to about 250 bushels by 1949. Yields remained at this level in the early 1950's.

The late crop is about 78 per cent of total potato production. Production increased in the 1940's because yields per acre rose more rapidly than acreage declined.

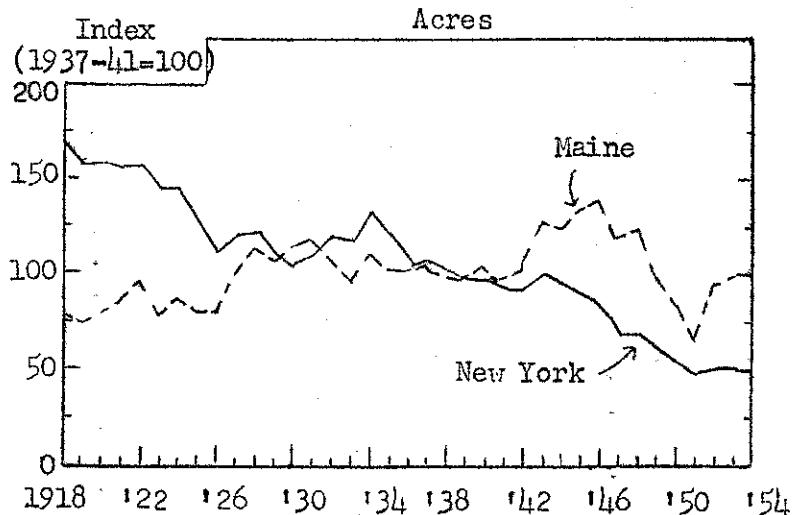

POTATOES

NEW YORK AND MAINE

In the early 1950's, the New York acreage of potatoes was about one third that of 1920 and was concentrated on farms growing potatoes commercially. In Maine, potato acreage continued to expand over a 30 year period but dropped sharply when price supports were discontinued in 1950.

A gradual improvement in yield per acre of potatoes occurred from 1918 to 1945. Yields sharply increased in the late 1940's to around 300 bushels for New York and 400 bushels for Maine.

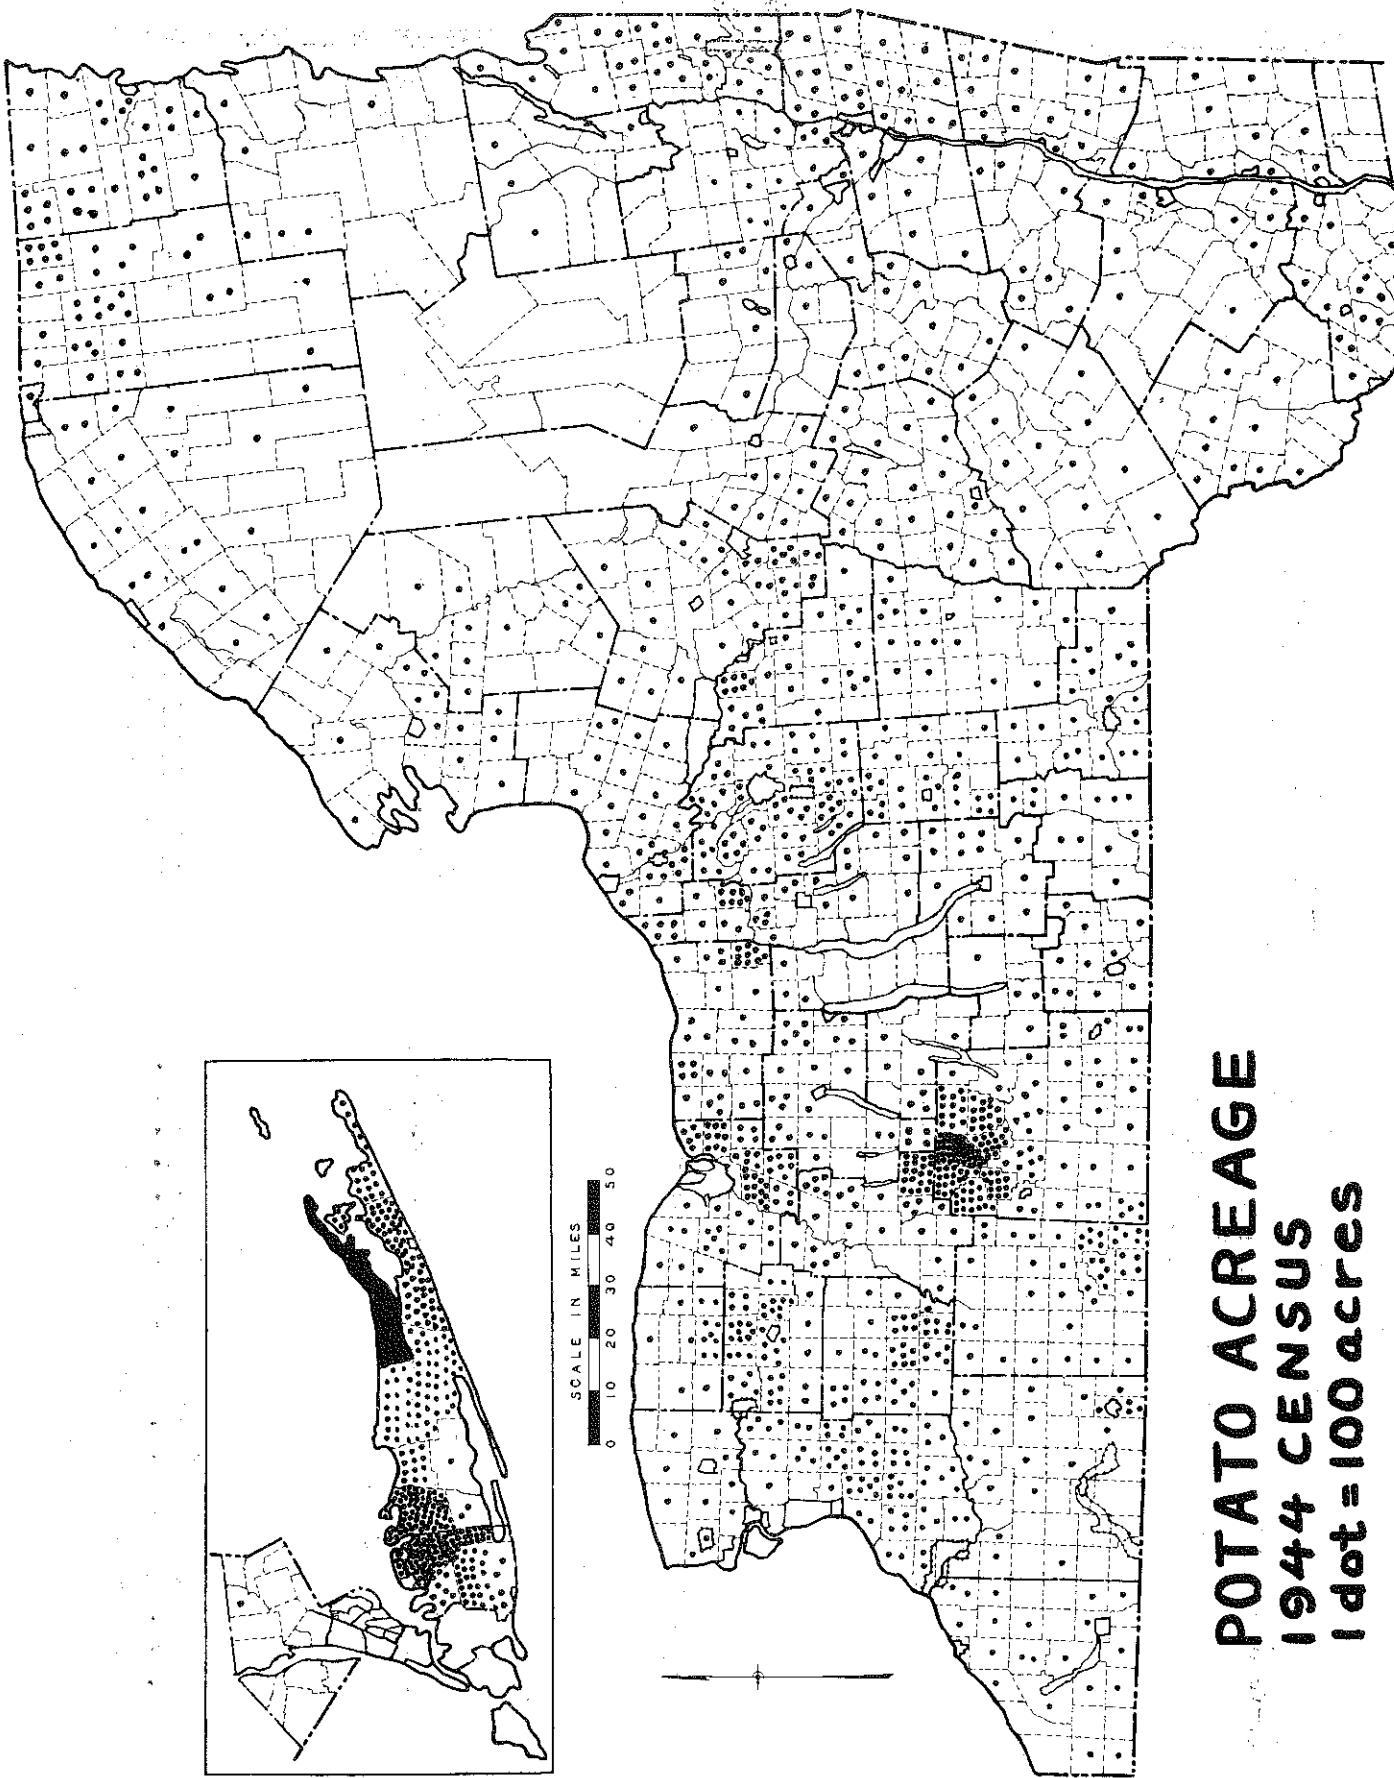

Potato production in New York varied around 30 million bushels for the quarter century beginning in 1918 even though acreage declined two thirds. In Maine production tended to increase but with wide fluctuations. Maine production in the early 1950's was double that of the early 1920's.

POTATOES

POTATOES

LONG ISLAND AND UPSTATE NEW YORK
(Actual Units)

Potato acreage in Upstate New York dropped from nearly 400,000 acres at the turn of the century to about 50,000 in the mid-1950's. On Long Island the acreage increased from around 20,000 in 1900 to more than 70,000 in the mid-1940's and around 50,000 in the 1950's.

Yields from 100 to 150 bushels per acre were typical of the first 30 years of this century. They began to increase on Long Island in the mid-1930's and in the 1950's averaged more than 300 bushels. In Upstate New York higher yields came in the mid-1940's and were above 250 bushels in the 1950's.

From 1900 to 1940 potato production increased on Long Island and fell off on Upstate farms. Early in the '40's Long Island production exceeded that from Upstate areas. In the next 10 years Upstate production varied from 13 to 20 million bushels.

SPINACH

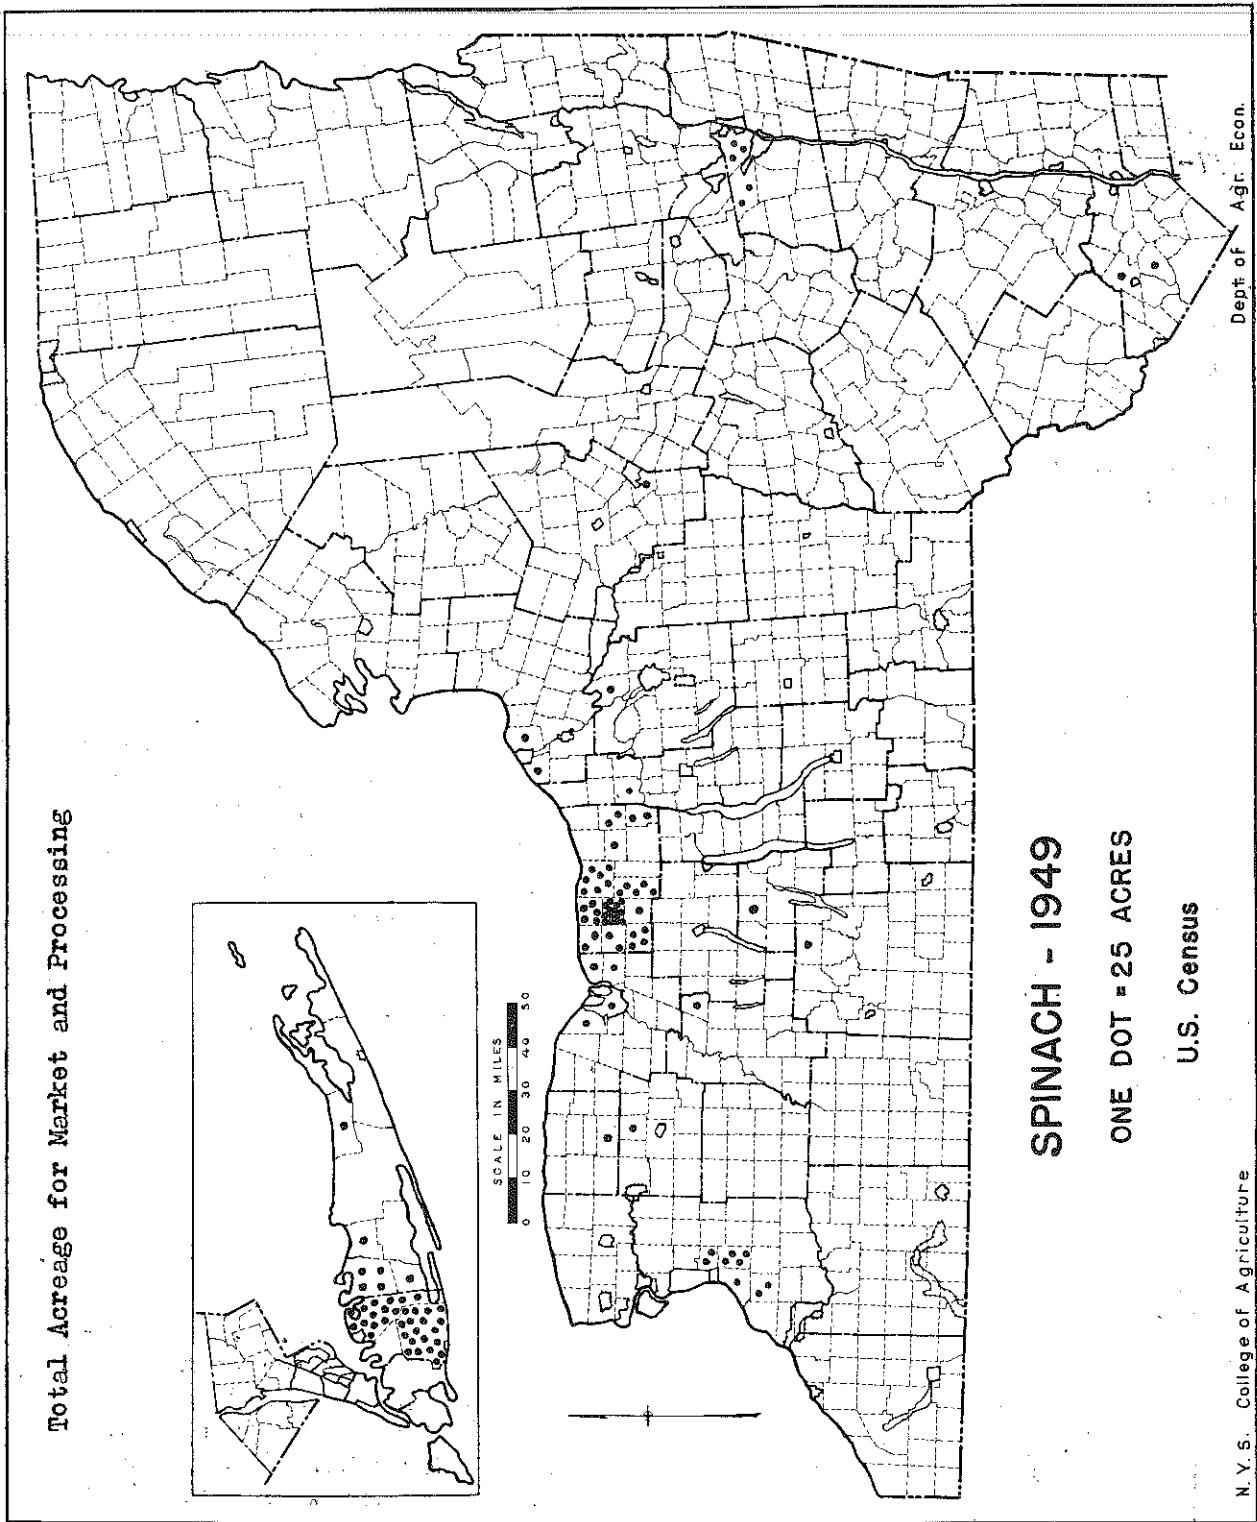

Spinach is raised rather extensively on western Long Island. Most of this spinach is sold for fresh market consumption in New York City.

The concentrated acreage of spinach on muck lands in Wayne County represents acreage that was providing spinach for canning and freezing plants in 1949. Like the United States, the New York acreage of spinach reached its peak during World War II. Both acreage and production had declined nearly one third by the early 1950's.

SPINACH

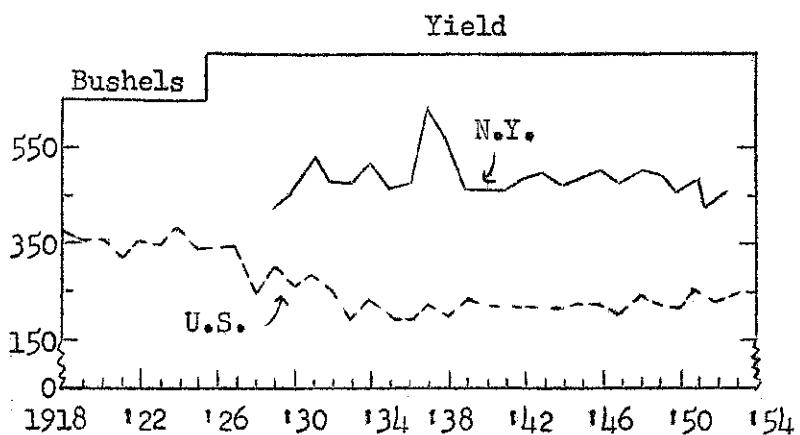

SPINACH

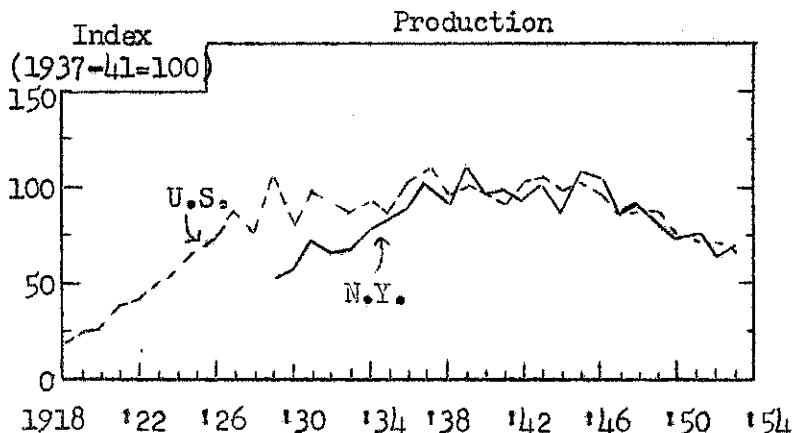

FOR MARKET*

The U. S. acreage of spinach continued to expand rather sharply from 1918 to about 1936. For a few years little change occurred in acreage and then the market spinach acreage declined for nearly a decade. In New York the trend in spinach acreage was similar to that for the United States as a whole although the acreage in the early 1950's was not quite as low compared with prewar as it was for the United States.

The yield of spinach for market gradually declined from 1918 to the mid-1930's and showed relatively little change over the next 20 years. In New York spinach yields continued fairly constant from year to year but at a level considerably above that of the U. S. average.

The U. S. production of spinach expanded from 1918 to the mid-1930's, showed relatively little change from then until the end of World War II and then gradually declined. The trend in New York was much like that of the United States through the War years and those following the War.

* Includes some production used for processing.

STRAWBERRIES

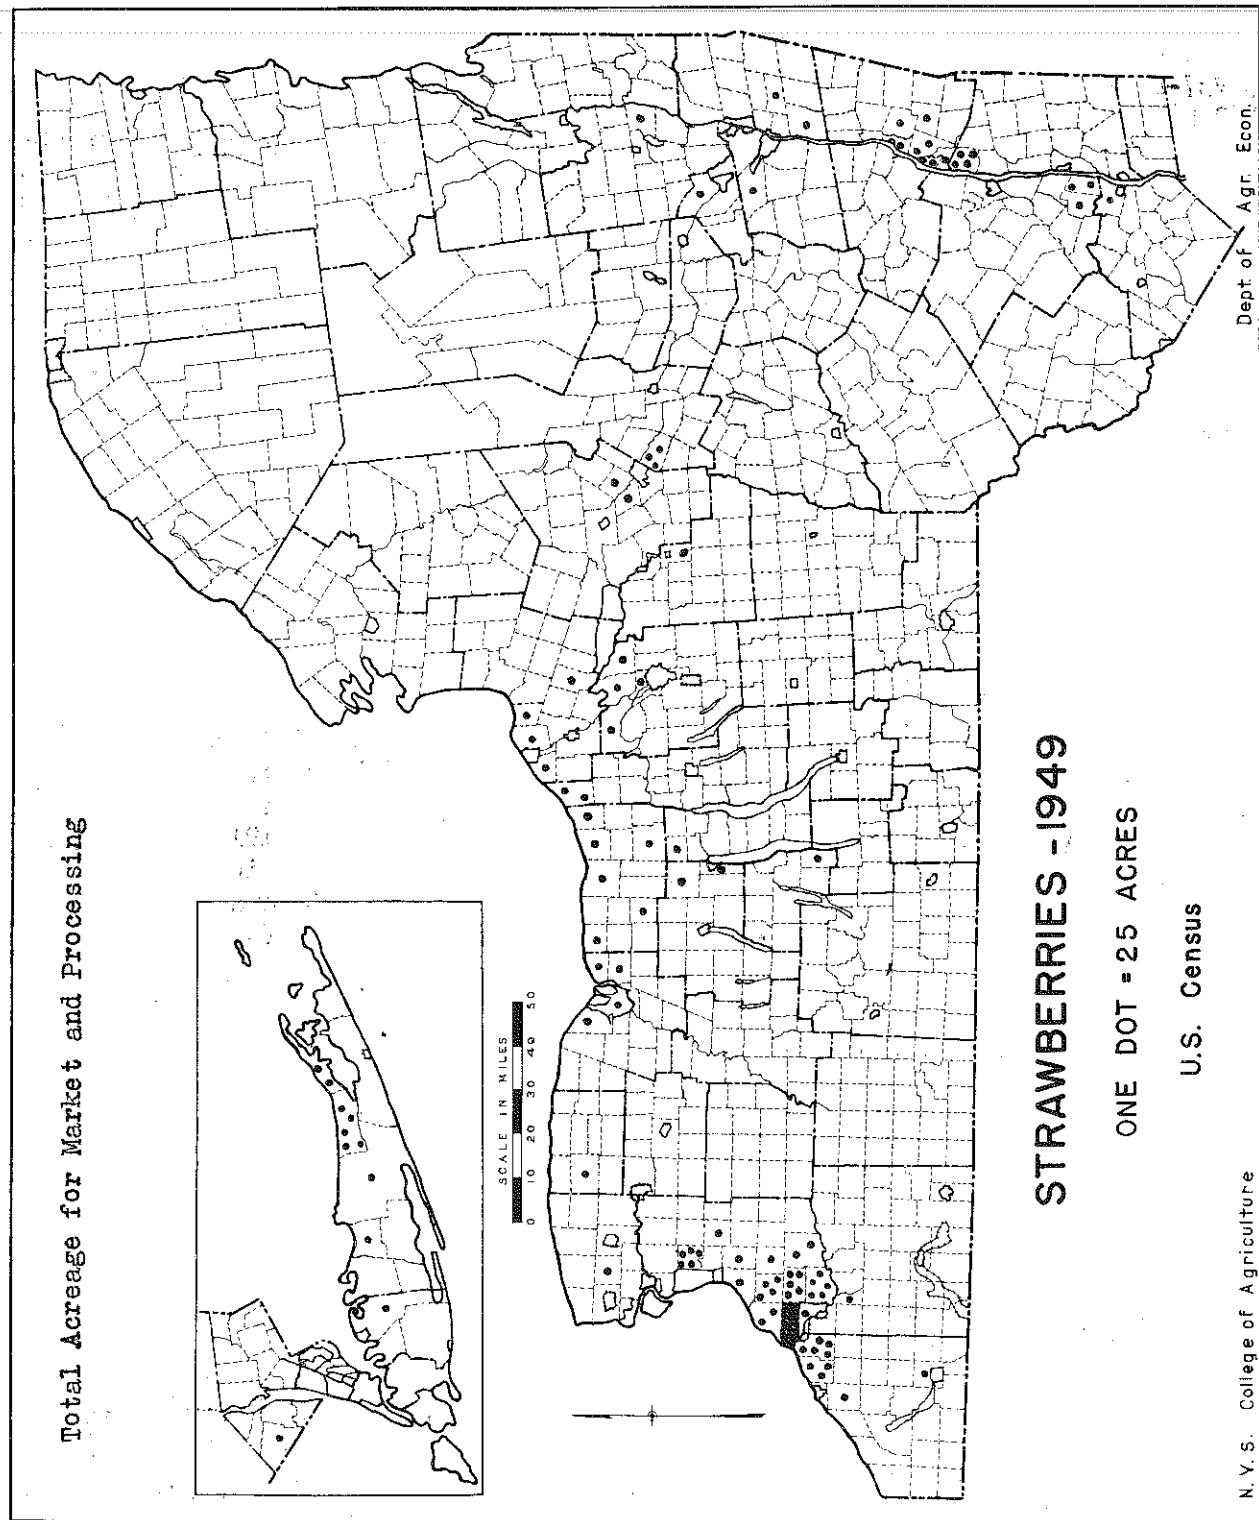

The most concentrated acreage for strawberry production is southwestern Erie and northeastern Chautauqua Counties along Lake Erie. Other areas include eastern Long Island, The Hudson River Valley and Oswego, Cayuga and Wayne Counties along Lake Ontario.

The 1949 Census figures on which the map is based are somewhat smaller than the acreages reported in the early 1940's and again in the early 1950's.

A.E. 951

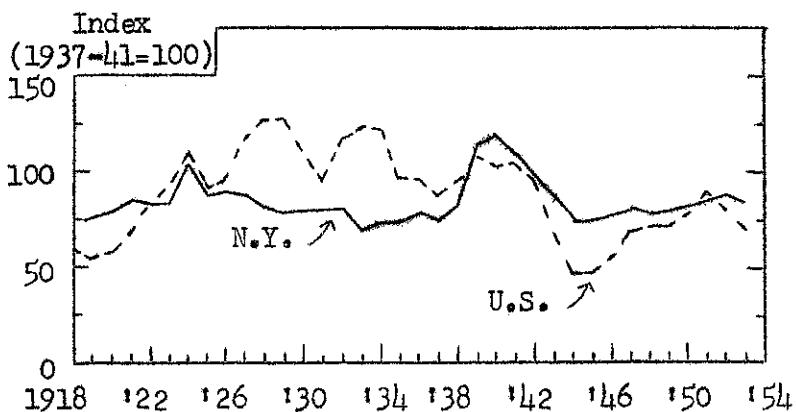

-95-

STRAWBERRIES

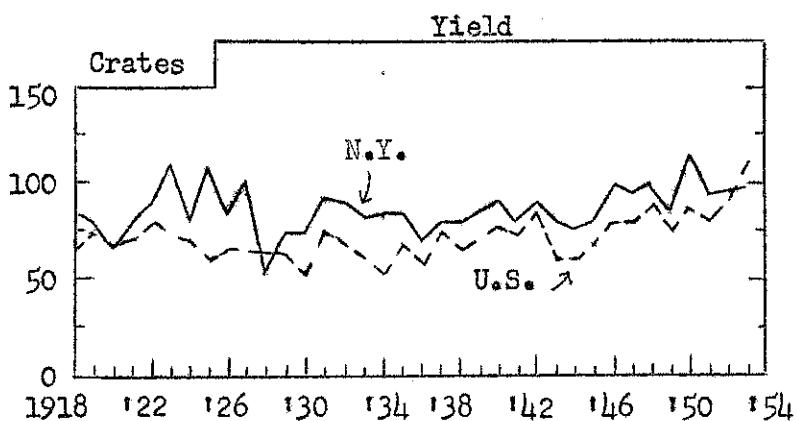

STRAWBERRIES

FOR MARKET AND PROCESSING

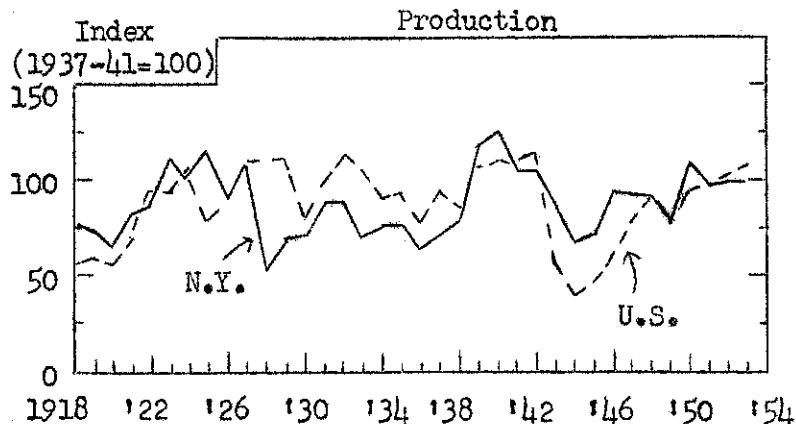

The acreage of strawberries in the United States increased from 1918 to the late 1920's and then gradually declined over the next 20 years.

In New York strawberry acreage has shown relatively little change over the past 35 years.

The yield of strawberries in the United States showed very little change during the 20-year period from 1918 to 1938. Some increase in yield occurred in the late 1940's and early 1950's.

In New York the trends in yield per acre were similar to those for the United States as a whole.

The total production of strawberries has shown relatively little change except for the decline in production during World War I and World War II.

TOMATOES

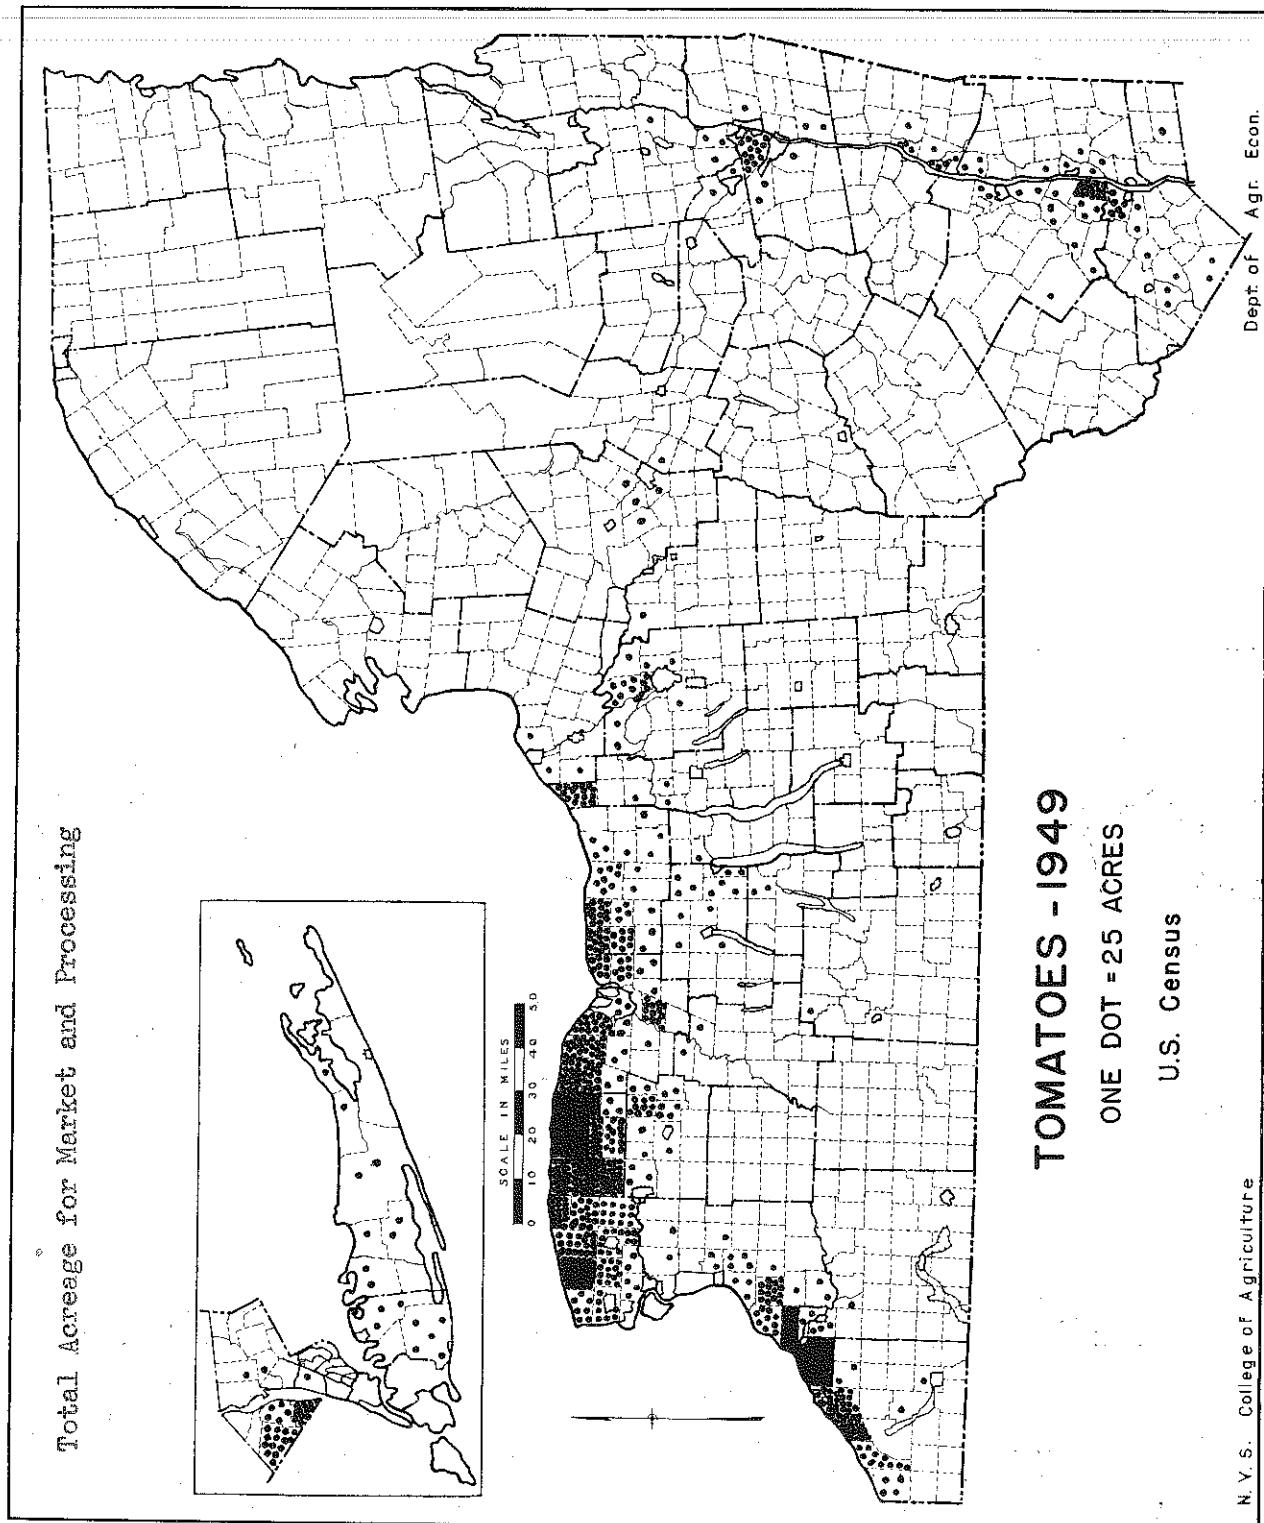

Most of the tomatoes raised on Long Island and in south-eastern New York are sold as market tomatoes. This is also true of the tomatoes which are raised around the Capital District near Albany, Schenectady and Troy, and near the cities from there to Buffalo.

The large concentration of tomato acreage in the counties bordering on Lake Ontario and Lake Erie is for processing.

About 73% of the 31,830 acres annually raised during the ten-year period, 1942-51, produced tomatoes for processing. This means about 23,000 acres for the processing plants and 8,730 acres for fresh market.

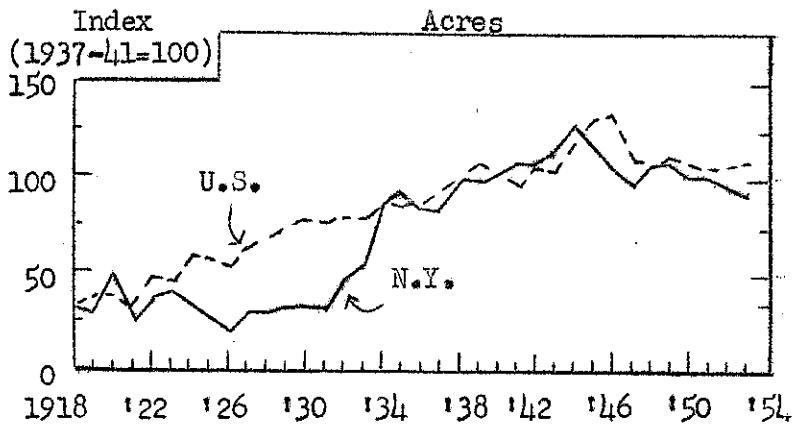

The acreage of tomatoes for fresh market increased from around 3,000 in the 1920's to about 10,000 in the 1940's.

The acreage of tomatoes for processing increased from about 11,000 in the 1920's to about 27,000 in the 1940's.

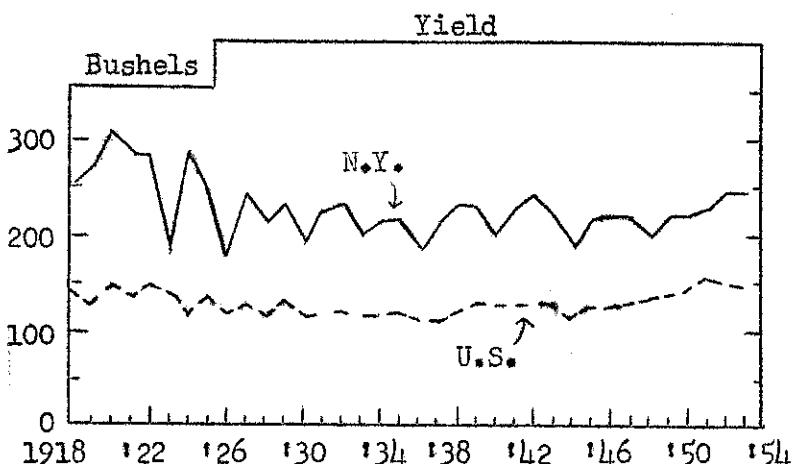

TOMATOES

FOR MARKET

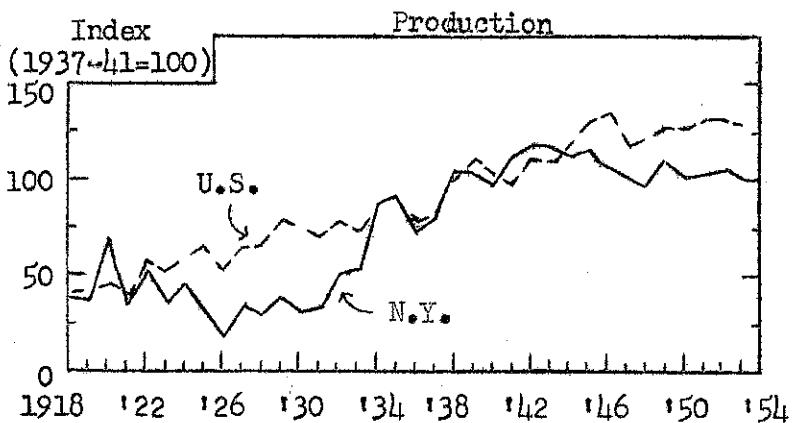

The U. S. acreage of tomatoes for market showed a rather steady upward trend from 1918 to 1946. During the next six years tomato acreage remained fairly constant at below the trend level.

In New York tomato acreage showed little tendency to increase from 1918 to 1930. Acreage then increased sharply and followed the trend of the U. S. average.

U. S. average yields of tomatoes tended slightly to decline from 1918 to the mid-1930's and then gradually increased to 1950.

In New York, the average yield of tomatoes has been somewhat above the average for the country as a whole but little long-time trend toward higher yields is evidenced.

The total production of market tomatoes in the United States has increased rather steadily for 30 to 35 years.

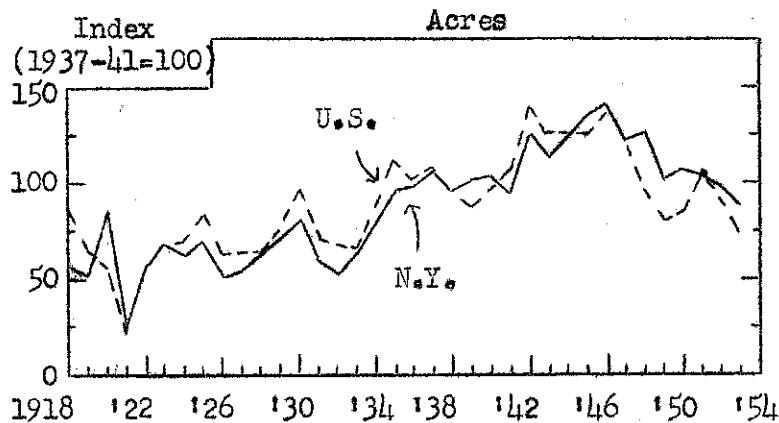

The trend in New York is similar for that of the country as a whole except for the lag in production during the late 1920's and early 1930's and again in the late 1940's and early 1950's.

TOMATOES

FOR PROCESSING

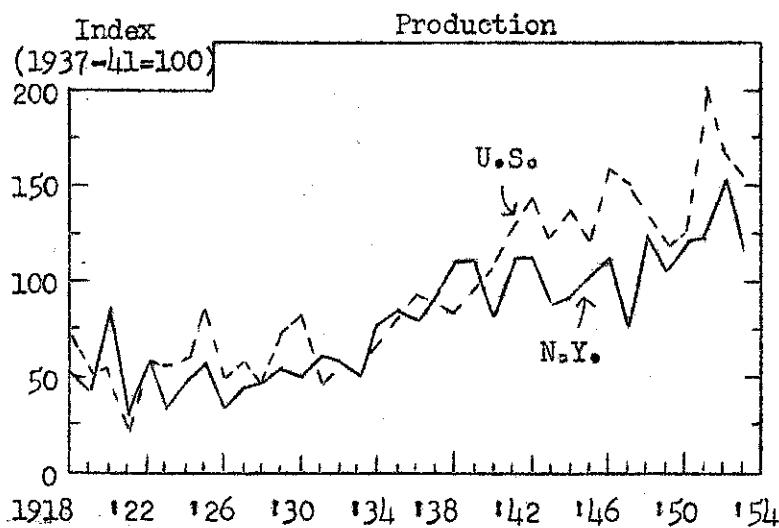

The acreage of tomatoes for processing in the United States has steadily increased from a low in 1921 to a high in 1946 and then has declined in more recent years. New York acreage has followed the same trend as for the United States.

Yield of tomatoes for processing in the United States remained fairly constant for 20 years beginning with 1918 and then started a strong upward trend to a peak of 11 tons per acre in 1953.

New York yields fluctuated more widely from year to year and were well above the U. S. average in the 1920's and 1930's but were more nearly similar in the 1940's and early 1950's.

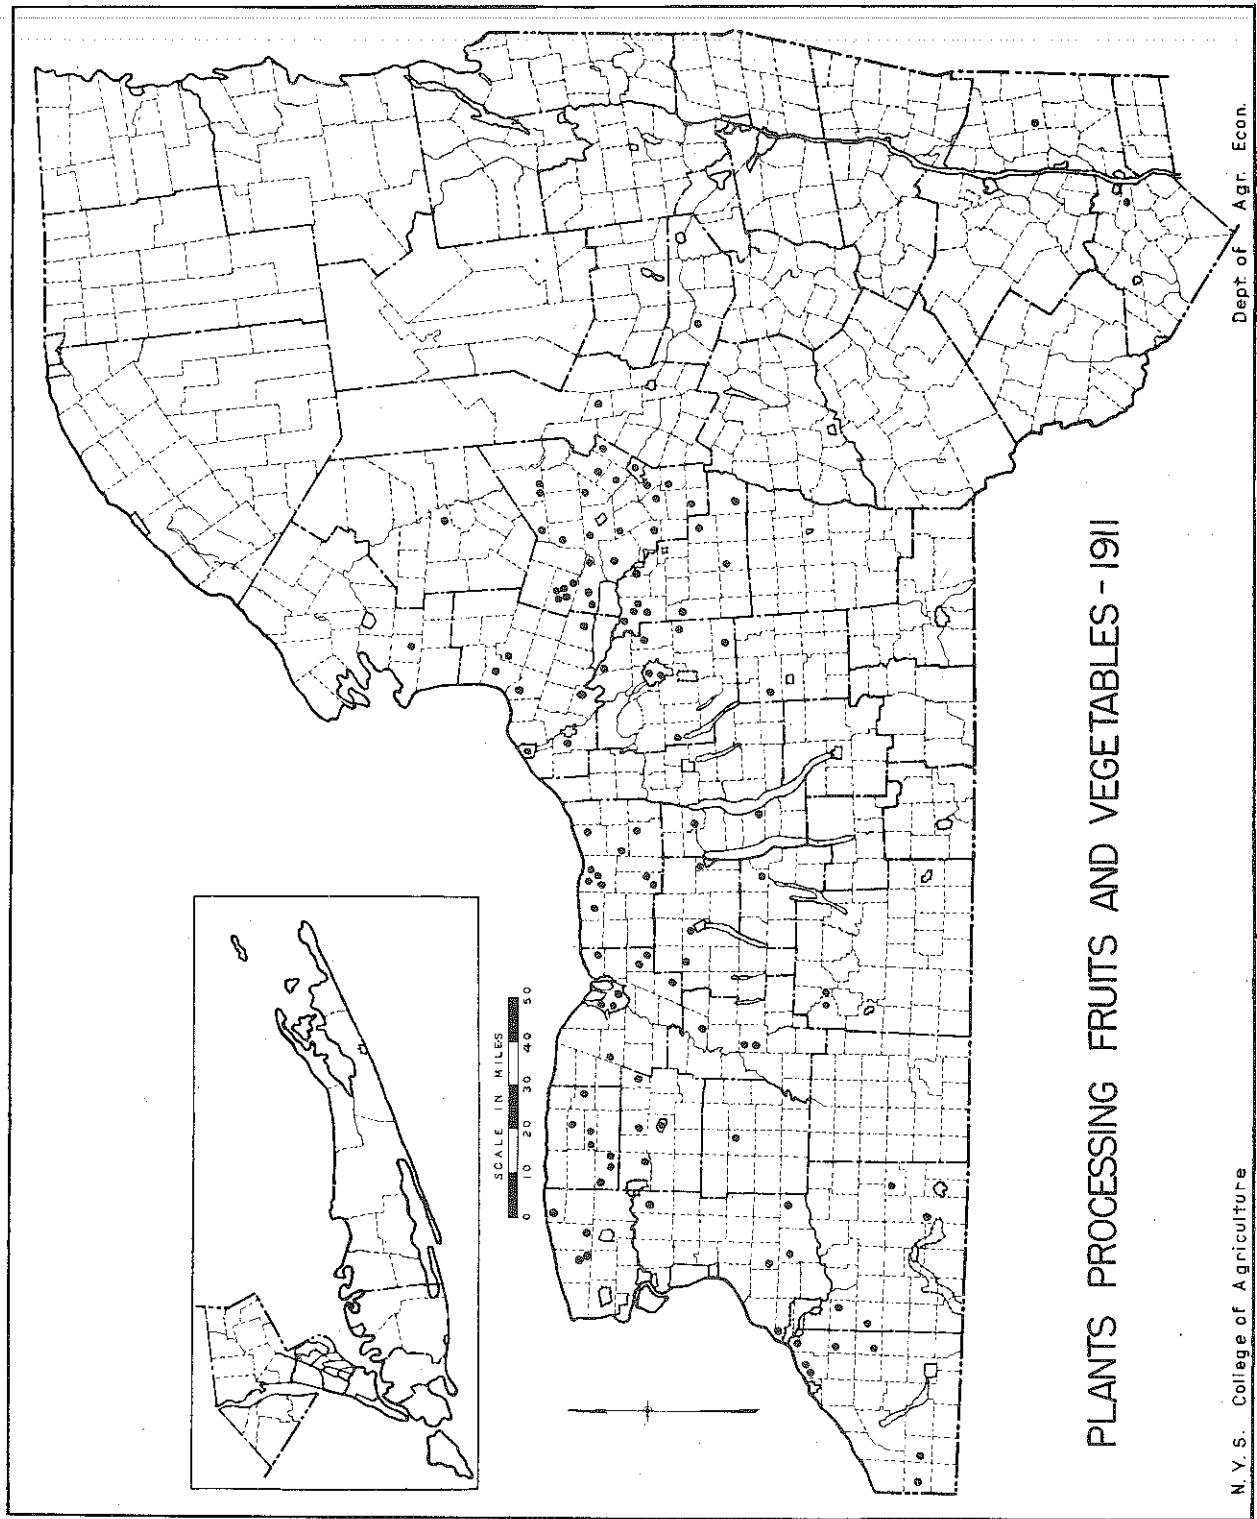

Both United States and New York production of tomatoes for processing showed a gradual increase over the last 35 years. Increased yields per acre have maintained this upswing as acreages have decreased in current years.
