Evaluating Spillover Effects of Red Meat and Poultry Recalls across Firms

Veronica F. Pozo* and Ted C. Schroeder†

*Assistant Professor, Utah State University; †Professor, Kansas State University

Introduction

- ❖ In the last two decades, about 1,300 red meat and poultry recalls have been issued in the U.S. representing nearly 638 million pounds of product recalled.
- ❖ Previous studies have found significant reductions in company valuations occurring right after the recall event (Salin and Hooker, 2001; Thomsen and MacKenzie, 2001). However, there is little evidence indicating how other firms in the industry, not directly involved in the recall, are affected by such food scares.
- ❖ A recall issued due to food safety reasons may either benefit or harm competing firms.
- ❖ This issue has direct implications for how meat and poultry firms and industries may be affected by industry-wide food safety enhancement investments.

Objectives

- ❖ The objective of this study is to evaluate spillover effects of red meat and poultry recalls across related firms.
- ❖ More specifically:
 - ❖ To quantify the magnitude of impact of individual recalls on competitor firms.
 - ❖ To examine whether the magnitude and direction of spillover effects are driven by selected factors.

Research Methods

- ❖ Assessing the economic impact that may result from a food recall requires firm-level data that are not generally available.
- ❖ To overcome this limitation, price reactions in financial markets are analyzed using an event study approach.

Event Study

The impact of a meat recall on rival firms is quantified by obtaining a measure of abnormal returns:

$$AR_{it} = R_{it} - E[R_{it}]$$

where R_{it} is the actual stock return of rival firm i at day t , observed during the recall event, and $E[R_{it}]$ is the normal return, expected had the recall event not occurred. Here, the market model is used as benchmark to predict normal returns.

Hypothesis Testing:

Negative Effects

$$H_0: CAAR(\tau_1, \tau_2) = 0$$

$$H_a: CAAR(\tau_1, \tau_2) < 0$$

Positive Effects

$$H_0: CAAR(\tau_1, \tau_2) = 0$$

$$H_a: CAAR(\tau_1, \tau_2) > 0$$

where $CAAR(\tau_1, \tau_2) = \frac{1}{N} \sum_{i=1}^N CAR_i(\tau_1, \tau_2)$ is the cumulative average abnormal return across N recalls, and $CAR_i(\tau_1, \tau_2) = \sum_{t=\tau_1}^{\tau_2} AR_{it}$ is the cumulative abnormal return for competitor firm i , aggregated over interval (τ_1, τ_2) surrounding the recall event. Under the null hypothesis, recall events do not have a significant impact on stock returns of competitor firms.

Data

Meat and poultry recalls are carried out under the supervision of the USDA's Food Safety and Inspection Service (FSIS). FSIS issued a total of 1,365 recalls from January 1994 to December 2014. Among these, 170 recalls from 31 different publicly traded firms were identified. Table 1 shows a description of these recalls by selected attributes. Daily stock price data from the 31 firms were collected using Bloomberg.

Table 1. Description of FSIS recalls by publicly traded firms (1994 – 2014)

Attribute	Description	No.	% Freq
<i>Class</i>			
Class I	Most severe	120	70.59
Class II	Remotely severe	41	24.12
Class III	Least severe	9	5.29
<i>Firm Size</i>			
Small	< \$1.4 billion	51	30.00
Medium	\$1.4 – \$5.3 billion	83	48.82
Large	> \$5.3 billion	36	21.17
<i>Recall Size</i>			
Very Small	< 10,000	46	27.06
Small	10,000 – 50,000	43	25.29
Medium	50,001 – 400,000	49	28.82
Large	> 400,000	28	16.47

Results

- ❖ Tables 2-4 report cumulative stock price reactions following a recall, as a measure of CAAR. Results are presented for the day after the recall announcement and up to 25 trading days.
- ❖ Results from the “All Recalls” column in table 2 indicate competitor firms are harmed by meat recalls. On average, the value of firms is reduced by 0.076% the day after the recall announcement.
- ❖ Table 3 indicates that when a recall is issued by a medium size firm, competitor firms are negatively affected. However, they benefit when the recall is issued by a larger firm.
- ❖ Sizable volume recalls negatively affect competitor firms. Table 4 shows that, on average, the value of firms decreases 0.377% three days after the recall announcement.
- ❖ Figures 1-3 illustrate these findings.

20	-0.011	-0.333	0.000
25	-0.024	-0.317	-0.216

Note: ** and * denotes statistical significance at the 5% and 10% level, respectively

Conclusions

- ❖ Findings provide evidence of spillover effects of meat recalls across firms. However, whether competitor firms benefit or are harmed by recall events depends on several factors.
- ❖ Large volume recalls or recalls issued by a medium size firm cause negative effects to competitor firms. Conversely, recalls issued by small firms benefit rival firms.
