FOOD SPENDING IN AMERICAN HOUSEHOLDS, 1980-81. David M. Smallwood and James R. Blaylock. National Economics Division, Economic Research Service, U.S. Department of Agriculture. Statistical Bulletin No. 731.

ABSTRACT

Average weekly total food expenditures per person rose from \$18.95 in 1980 to \$20.03 in 1981. Weekly spending per person for food at home and away from home rose from \$12.82 to \$13.53 and from \$6.11 to \$6.50, respectively. This bulletin presents information on weekly food expenditures per person. The percentage of households that purchased food is tabulated for 133 food categories by 10 household socioeconomic characteristics for calendar years 1980 and 1981. The data source is the 1980-81 Continuing Consumer Expenditure Survey prepared by Bureau of Labor Statistics.

Keywords: Food expenditures, BLS 1980-81 Continuing Consumer Expenditure Survey, Socioeconomic characteristics

ACKNOWLEDGMENTS

This report would not have been possible without Laura Kerneklia's perseverance in typing the manuscript. Richard Haidacher, Les Myers, Richard Prescott, and Mike Van Dress reviewed the text, and their help is gratefully acknowledged.

SALES INFORMATION

Additional copies of this report can be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Ask for Food Spending in American Households, 1980-81 (SB-731). Write to the above address for price information or call the GPO order desk at (202) 783-3238. You can also charge your purchase to your VISA, MasterCard, or GPO deposit account. Bulk (100 or more copies) discounts are available. Foreign address customers must add 25 percent extra for postage.

Microfiche copies (4.50 each) can be purchased from the National Technical Information Service, Identification Section, 5285 Port Royal Road, Springfield, VA 22161. Order by title and enclose check or money order, payable to NTIS. For additional information, call NTIS at (703) 487-4780.

The Economic Research Service has no copies for free mailing.

HIGHLIGHTS

Americans spent an average of \$20.03 per week on food in 1981 compared with \$18.95 in 1980. This weekly spending rose from \$12.82 to \$13.53 per person for food at home and from \$6.11 to \$6.50 for food away from home. The percentage of households purchasing items during a week from each of the major food groups remained relatively stable between the 2 survey years. The percentage of households purchasing items from food subgroups varied more than the percentage purchasing items from major food groups. Other highlights included in this report are as follows.

- o Household size--Married couples with children spent less per person on food eaten both at home and away from home. Single-parent households headed by men spent more per person than those headed by women. Both at-home and away-from-home food spending per person for single-member households exceeded the national average, but larger households were more likely to purchase a wider variety of food items than smaller ones.
- o Geographic location--Food spending varied with the geographic location of the household's residence. Residents of the Northeast spent the most per person on food at home. Westerners spent the most per person on food away from home. Residents of Standard Metropolitan Statistical Areas (SMSA's), except those in the South, spent more on food than did residents of other urban areas. However, all SMSA residents spent more on food away from home.
- o Income--Average per person food expenditures increased as income levels increased. In 1981, the households in the lowest 20 percent of the income distribution spent \$12.28 per person for food at home compared with \$16.03 for households in the highest 20 percent. In general, wealthier households spent more on most food items and purchased a greater variety.
- o Race--In both 1980 and 1981, nonwhites spent less per person on food at home, food away from home, and dairy products than did whites. Nonwhites spent more on poultry products and on fish and shellfish.
- o Age--Per person food-at-home spending tended to increase with the age of the householder. Elderly householders (those over 64 years) spent less per person on food away from home than did younger householders. However, elderly householders spent more than the national average on total food as well as on food at home.
- o Season--Seasonal purchases varied more per person for items with seasonal production patterns, such as fresh fruits and vegetables, and for products used heavily during holiday periods, such as sugar and alcoholic beverages. Major food groups showed less seasonality than did subgroups. Households were more likely to purchase steak and ground beef during the summer and roasts during the winter. Households bought fresh tomatoes less frequently in the summer and fall than in the spring, possibly because of the prevalence of home gardening. Ice cream and beverage purchases also varied seasonally.

Food Spending in American Households, 1980-81

David M. Smallwood
James R. Blaylock

INTRODUCTION

Weekly per person food expenditures of households and the percentage of households purchasing selected food items in a week are tabulated by selected socioeconomic and demographic characteristics for 1980 and 1981. These tabulations are based on data from the Continuing Consumer Expenditure Survey (CCES) of the Bureau of Labor Statistics (BLS). They provide more food item detail than is available in BLS Bulletin 2173, Consumer Expenditure Survey: Diary Survey 1980-81, published in 1983. The CCES contains the most recent and comprehensive data available on food spending by Americans.

Information in this report can be used to determine the similarities and disparities in spending habits of households of differing sizes, races, incomes, geographic regions of residence, and other sociodemographic and economic features. This information is valuable for assessing existing market conditions, product distribution patterns, consumer buying habits, and consumer living conditions. Combined with demographic and income projections, this information may be used to gain insight into future consumption trends. In addition, the information may be used to develop typical market baskets of foods for special population groups, such as the elderly. These market baskets may, in turn, be used to develop price indices tailored to the consumption patterns of these population groups.

The CCES evolved from consumer expenditure surveys of American households that BLS has been conducting periodically at about 10-year intervals since 1888. A major objective of the first consumer expenditure surveys was to collect information necessary to construct the old Cost-of-Living Indices and the current Consumer Price Indices. However, with the rapidly changing economic conditions of the seventies, BLS found that the decennial surveys were inadequate. Consequently, in late 1979, BLS initiated a continuing survey of consumer expenditures and expanded the objectives to include a continuous flow of information on the buying habits of Americans not only for use in revising the Consumer Price Index but also for uses in a variety of research by government, business, labor, and academic analysts.

CONTINUING CONSUMER EXPENDITURE SURVEY 1/

The CCES comprises two components, each with its own questionnaire and sample: (1) An Interview Panel Survey in which each of approximately

1/ Technical descriptions of the BLS-CCES and definitions draw heavily from Consumer Expenditure Survey: Diary Survey 1980-81, Bulletin 2173, Bureau of Labor Statistics, U.S. Department of Labor, 1983.

5,000 household are surveyed every 3 months over a 1-year period, and (2) a Diary Survey of approximately the same sample size in which households keep an expenditure diary for two consecutive 1-week periods. Technically, the survey is comprised of consumer units rather than households. However, unless it is clearly specified otherwise, the two terms are used synonymously in this report. See Definitions for a detailed explanation of the differences.

The Interview Panel Survey obtains data on large and infrequent expenditures, such as those for real property, automobiles, and major appliances and those which occur on a regular basis, such as rent, utilities, and insurance premiums. Personal expenditures, including those for food made on trips are also included. These are expenditures that respondents can typically be expected to recall over a 3-month period.

The Diary Survey obtains data on small, frequently purchased items that are normally difficult to recall, including food and beverages, tobacco, house-keeping supplies, nonprescription drugs, personal care products and services, fuels, and utilities. The Diary Survey excludes expenditures incurred while persons are away from home overnight or longer.

Several features of the 1980-81 survey differed from the surveys BLS conducted for 1960-61 and 1972-73. First, only the urban population was continuously represented in the CCES because rural sampling units were dropped from the sample in 1981 due to budget limitations. Second, the new sample size was approximately half that of the previous two surveys, so the estimates were subject to greater sampling error. Third, the collection of information on expenditures of college students changed. In the CCES, students living in college or university housing were sampled directly, while in the 1972-73 CES, this group's expenditures were reported by their parents or guardians. Last, the new survey had a somewhat different definition of the "head" of a consumer unit. It used the term "householder" or "reference person," which was defined as the first member of the household mentioned by the respondent as an owner (or renter) of the premises at the time of the initial interview. In previous surveys, husbands were automatically considered to be the heads of consumer units in which both a husband and a wife were present.

This bulletin is based on data collected in the diary component of the 1980-81 BLS survey as reported in the public use data tapes available from BLS. Information on the statistical design of the survey is presented in the "Survey Procedures" section.

DEFINITIONS

The following terms, some of which occur frequently in the accompanying tables, are briefly defined.

Population

Population--The U.S. civilian noninstitutional urban population, as well as that portion of the institutional population living in rooming or boarding houses or in doctors' and nurses' quarters of general hospitals. Armed forces personnel living outside military installations are included, but all other armed forces personnel are excluded.

Standard Metropolitan Statistical Area (SMSA)--Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to a county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns or cities, rather than counties.

Urban Population--All persons living in SMSA's and in urbanized areas and urban places of 2,500 or more persons outside of SMSA's. The term "other urban" is used in this bulletin to describe that proportion of the population living outside of SMSA's.

Student Population--Students living in college or university housing, usually dormitories.

Primary Sampling Unit (PSU)--Usually a county or group of contiguous counties, except in certain areas of the Northeast where a PSU is a cluster of towns. A PSU may include both urban and rural areas as well as farm and nonfarm areas.

Geographic Regions--Data are presented for four major regions: Northeast, North Central, South, and West. Consumer units are classified by these regions according to the address at which the household was residing during the time of their participation in the Diary Survey. These regions comprise the following States:

Northeast--Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central--Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South--Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West--Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Consumer Unit (Household)

Consumer Unit--A consumer unit, the basic reporting unit for the Diary Survey, comprises either: (1) all members of a particular household who are related by blood, marriage, adoption, or other legal arrangement such as a foster child; (2) a financially independent person living alone or sharing a household with others, living as a roomer in a private home or lodging house, or living in permanent quarters in a hotel or motel; or (3) two or more persons living together who pool their income to make joint expenditure decisions.

Financial independence is determined by three major expense categories: housing, food, and other living expenses. To be considered financially independent, the respondent must provide at least two of the three major expense categories.

Householder--The first household member mentioned by the respondent when asked to "Start with the name of the person, or one of the persons, who owns or rents the home." It is with respect to this person that the relationship of other consumer unit members is determined.

Size of Household--The number of persons who normally make up the consumer unit at the sample address.

Age of Householder--This is the actual age of the householder at the time the Diary is placed in the household.

Number of Earners--All consumer unit members who report having worked at least 1 week during the 12 months prior to the interview date are classified as earners. This measure will tend to overstate the number of earners employed on a regular basis.

Number of Vehicles--The number of automobiles, trucks, and other vehicles owned by all members of the unit. It includes vehicles used partially for business but excludes those used entirely for business.

Income

Total Income--The combined income earned by all consumer unit members 14 years old or over in the 12-month period prior to the last day of participation in the survey. The components of income are wages and salaries, net business and farm income, social security and other pension income, interest, dividends and other asset income, and other income. Other income includes (1) supplemental security income paid by Federal, State, and local welfare agencies to low-income persons who are 65 years or over, blind, or disabled; (2) income from unemployment compensation; (3) income from workers' compensation and veterans' payments, including education benefits but excluding military retirement; (4) public assistance or welfare, including money received from job training grants; (5) alimony and child support as well as any regular contributions from persons outside the consumer unit; (6) money income from care of foster children, cash scholarships, fellowships, or stipends not based on working; and (7) the purchase value of food stamps.

Complete Income Reporting--The distinction between complete and incomplete income reporting is based on whether the respondent provides information on wages and salaries, self-employment income, and social security income. Even complete income reporters may not provide a full accounting of all income from all sources.^{2/} Income tabulations in this publication are based only on consumer units with complete income data.

^{2/} The current definition of "complete income reporting" is different from the 1972-73 definition. A consumer unit reporting zero income in 1972-73 was considered a complete respondent as long as there was no evidence of intent to refuse the income question. In the 1980-81 survey, across-the-board zero income reporting was designated as invalid by BLS, and the consumer unit was categorized as an incomplete reporter. Neither survey, however, accounted for possible underreporting. Consumer units designated as incomplete reporters of income are excluded from computations of average income in this report. This procedure differs from that used in BLS Bulletin No. 2173, which includes those households giving incomplete reports in tabulations of average income for tabular groups.

Top Coding of Income--Consumer units reporting annual incomes of \$75,000 and above are coded in the public use data tapes as \$75,000 to satisfy Federal regulations set up to protect the identity and privacy of survey participants. Top coding of income leads to a downward bias in the estimate of average income.

Quintiles of Income Before Taxes--Each quarter, respondents that provide income reports are ranked in ascending order according to the level of total before-tax income reported by the consumer unit. The ranking is divided into five equal groups called income quintiles, and the data for each of the four quarters are then combined. Consumer units providing incomplete income reports are not ranked and are shown separately in all income tables.

EXPENDITURE ESTIMATES

Expenditures are the transaction costs, including excise and sales taxes, of goods and services acquired during the recordkeeping period. The respondent records the full cost of each purchase even though full payment may not have been made on the date of purchase. The expenditure estimates exclude purchases made while away from home overnight, purchases directly assignable to business use, and periodic credit or installment payments on goods or services already acquired.

Major food and beverage expenditure categories and subgroups that appear in this bulletin are displayed in tables 1-40.

SURVEY PROCEDURES

Technical details concerning the CCES sample design, geographic coverage, sampling frame, level of participation, sample weighting factors, data collection, and data processing are discussed in this section.

Sample Design

Data for the CCES were obtained from a nationwide probability sample of households designed to be representative of the total civilian noninstitutional population. The sample consisted primarily of persons living in regular housing units and some selected group quarters such as college dormitories.

Geographic Coverage

A sample of geographic areas called primary sampling units (see Definitions) was selected for the survey. The set of sample PSU's consisted of 101 geographic areas, 85 of which were urban areas that were previously defined and selected for the BLS Consumer Price Index. The PSU's were placed in five categories: "A" PSU's, which comprised 27 "certainty" areas (for example, they were self-representing) and were primarily large SMSA's; "B" PSU's, which comprised 20 SMSA's, each with a total 1970 population of over 400,000; "C" PSU's, which comprised 22 SMSA's with a total 1970 population of 400,000 or less; "D" PSU's, which comprised 16 urban places in all areas outside of SMSA's; and "E" PSU's, which comprised 16 rural areas. BLS followed a controlled selection procedure to insure proper geographic distribution of the selected

PSU's. The rural portion of the sample was dropped in 1981 for budgetary reasons; so to maintain consistency, the rural households are also excluded from the 1980 sample in this report.

Sampling Frame

The sampling frame for the survey was developed from the Bureau of the Census' 20-percent-sample data file (1970 census), which included those households completing the long-form questionnaire. This file was updated using reports of building permits issued since 1970 for privately financed residential construction. These units were sampled independently within each PSU. Measures were also taken to account for units missed in the 1970 enumeration and conversions, mobile homes put in place, and group quarters constructed since 1970. Housing units designated for interview were redistributed evenly throughout the year, except for December, when the sample was augmented to account for substantially increased buying activity during the holiday season.

Level of Participation

Approximately 7,500 consumer units were scheduled for selection in each year of the diary survey. Of these units, some were found to be vacant, nonexistent, or ineligible for the period, and were therefore not surveyed. Of those remaining units, some were not contacted by the interviewer, some refused to participate, and some were temporarily absent for reasons such as vacations. Sample units with occupants that were temporarily absent were included in the final sample. These consumer units, along with those from whom data were collected, made up the eligible sample in each survey year. Response rates ranged from 85 to 90 percent of the eligible sample.

Weighting

Weights were assigned to each consumer unit participating in the survey in order to provide estimates for the U.S. urban population. These weights, derived from the urban control totals of the Current Population Survey, were a product of several factors: The probability of selection of the housing unit; a December seasonal factor; a factor to adjust for subsampling in the field; a noninterview adjustment; a national ratio-estimate adjustment for age, sex, and race to urban civilian, noninstitutional population controls; and a final adjustment based upon family composition. The weighting process was performed each month on diaries beginning within the month, and each week's interview was weighted separately.

Data Collection

The Bureau of the Census collected the data for BLS. At the beginning of the 2-week collection period, the Census interviewer used the Household Characteristics Questionnaire to record information on the age, sex, race, marital status, education, and family relationships of members of the sample unit. At this time, the interviewer also left the Diary Questionnaire, or daily expense record, with the consumer unit. The Diary Questionnaire, designed as a self-reporting, product-oriented diary, was used by respondents to record all expenses incurred during participation in the survey. It was divided by day of purchase and by a broad classification of goods and services.

At the end of the first week, the interviewer picked up the diary, reviewed the entries, clarified any questions, and left a second diary. At the end of the

next week, the interviewer picked up the second diary and reviewed the entries. At the same time, the interviewer again used the Household Characteristics Questionnaire to collect previous-year information on the work experience, occupation, industry, retirement status, earnings from wages and salaries, net income from business or profession, net income from one's own farm, and income from other sources. This information, along with the other household characteristics data, was collected to permit (1) classification of families for analysis, (2) determination of eligibility of the family for inclusion in the population covered by the Consumer Price Index, and (3) adjustment for non-response by families who did not cooperate in the survey.

Data Processing

The Bureau of the Census performed a preliminary set of clerical processing activities, including a number of critical data edits and adjustments. During a field edit, data in the diaries were reviewed for completeness and consistency. All notes were reviewed so that expenditure data could be transcribed to the questionnaire for keypunching. In addition, item codes were assigned to the reported expenditure items, household and consumer unit codes were assigned to each family member, and industry and occupation codes were entered for each working family member. At the completion of the clerical processing activities, the data were keypunched and loaded onto computer tapes.

The data were then processed by computer to (1) calculate population weights based on BLS specifications, (2) impute demographic characteristics for missing or inconsistent demographic data, (3) impute values for weeks worked when non-response was encountered, and (4) apply appropriate sales taxes to the expenditure items. Finally, a computer file containing these data was produced and transmitted to BLS on a monthly basis.

As the monthly diary data tapes were received, BLS created a quarterly data base which was screened for invalid coding and inconsistent relationships, as well as for extreme values that may have been recorded or keypunched erroneously. Coding and extreme-value errors were corrected before further processing.

BLS subjected selected portions of the diary data to automated imputation and allocation routines when respondents reported insufficient detail to meet publication requirements. The imputation routines assigned qualifying information to data items when there was clear evidence of an invalid non-response. Allocation routines were also performed to transform reports of nonspecific items into specific ones. For example, when respondents reported expenditures for meat rather than beef or pork, allocations were made using proportions derived from item-specific reports in other completed diaries.

Finally, BLS processed income data through a routine that identified and coded the data as either complete or incomplete. This distinction was based on a well-defined set of rules for reporting the types of income received by individual members and the consumer unit as a whole. Even though incomplete reporting was identified, no income imputation was performed; however, the option of imputing income is being studied by BLS.

CCES AND OTHER DATA SOURCES

The U.S. Department of Agriculture conducts comprehensive household surveys of food consumption approximately every 10 years. The most recent is the 1977-78

Nationwide Food Consumption Survey (NFCS), which differs in several respects from the 1980-81 BLS-CCES. The most notable difference, other than the survey years, is that the NFCS measures food consumption during the survey period, while the CCES measures purchases. Consequently, differences may occur due to the value of nonpurchased foods, such as homegrown food and food received as a gift or for pay. These items are included in the NFCS but not in the CCES. Differences also arise because of the timing of consumption versus purchases and changes in household food inventories. However, the disparities among households due to inventory changes tend to average out when tabulations cover large groups of consumers.

Another difference between the two surveys is the unit of observation. USDA uses the household as the observational unit, whereas BLS uses the consumer unit as the basic unit of observation. While these are largely the same, differences between units classified by living arrangements and economic consuming units will exist, as in the instance of unrelated, economically independent individuals living together.

Population coverage also differs between the two surveys because the NFCS excludes individuals in group dwellings, such as college students living in dormitories, whereas the CCES includes them.

In addition, many USDA tabulations of the NFCS data include only housekeeping households; that is, households in which at least one member consumed 10 or more meals from home food supplies during the 7-day survey period. Since housekeeping households consume more home food supplies than do nonhousekeeping households, food expenditure estimates based solely on housekeeping households tend to overestimate at-home consumption and underestimate away-from-home consumption. Survey estimates suggest that approximately 6 percent of the civilian noninstitutional population covered by the NFCS are nonhousekeeping households.

Also, in the NFCS data, food purchased at restaurants, carryouts, and similar types of establishments and carried home for consumption are included in at-home food expenditures. In the CCES, these types of expenditures are included in away-from-home food spending.

An obvious difference between the NFCS and CCES is the time period of the surveys, 1977-78 and 1980-81, respectively. Consequently, differences in economic conditions, such as prices, product availability, and consumer purchasing power, will contribute to observed differences in the reported data.

The Personal Consumption Expenditures (PCE) data are a component of the Gross National Product Accounts, prepared quarterly by the U.S. Department of Commerce and published in Survey of Current Business. The PCE series measures personal expenditures on a national level for all newly produced goods and services. These estimates are based on business and government sources rather than household interviews, so the source and derivation of the PCE estimates have little resemblance to the CCES estimates. The PCE estimates are also based on the total population, while those of the CCES are based only on the urban component.

Benchmark estimates for the PCE series are developed approximately every 5 years based on the flow of goods and services through the economy. For example, personal consumption expenditures for food are derived by adding transportation costs and wholesale and retail trade markups to manufacturer's prices. Additional adjustments are made for exports, imports, and changes in

inventories. Between benchmark years, the various components of the PCE series are updated using survey information on sales of eating and drinking establishments and estimates of grocery store sales. Other minor adjustments are also made. The primary data are from the Censuses of Manufactures, Transportation, and Business.

When placed on an annual per capita expenditure basis, estimates from the CCES are consistently less than those reported in each of the following PCE food components: total food, food at home, and food away from home. The relative difference is greater for food away from home than for food at home, probably because the diary component of the CCES does not include expenditures on food while the respondent is away from home overnight or longer. Disparities between the estimates for expenditures on alcoholic beverages are even larger, but this result is not unexpected because full disclosure of alcoholic beverage consumption is extremely difficult to obtain in household surveys.

The PCE and CCES estimates of per capita annual income also differ, with the CCES income estimates being lower. This is consistent with the notion that income is generally underreported in household surveys.

A detailed description of the derivation of the PCE series is available in Development of National Income Measures, Supplement to Survey of Current Business (Bureau of Economic Analysis, 1954). A detailed comparison with the CCES data is reported in BLS Bulletin 2173.

DATA LIMITATIONS

Data reported in this bulletin are based on a sample of consumer units, and may differ somewhat from the figures that would be obtained if a complete census of consumer units had been taken. The variability of sample estimates is a function of sample design and sample size and generally decreases with larger size samples and aggregation over product categories. That is, expenditure estimates for broader expenditure groups and larger population groups will generally be subject to smaller sampling variation than expenditure estimates for narrower expenditure and population subgroups. The coefficient of variation (CV), defined as the standard deviation as a percentage of the sample estimate, is a commonly used measure for comparing the relative variability of sample estimates. CV's for the various detailed estimates of weekly per person food expenditures presented in this report for the total urban population are given in table 41.

The estimates are also subject to sampling biases that may result from the selection of households, the recording of information, and the interpretation of information. However, the long and extensive experience of BLS in conducting surveys of this type helps to minimize these sampling biases.

Identifying and handling incomplete questionnaires constitute another potential source of bias. In the CCES diary, identifying incomplete expenditure reporting is particularly difficult because respondents are required to report on only items actually purchased. No action is required on items not purchased during the survey. Distinguishing between an incomplete expenditure diary and one in which the respondent purchased only a few items is difficult. Incomplete reporting on other sections of the survey may be associated with incomplete expenditure diaries. For example, homeowners not reporting a mortgage status are found to be about half as likely to report purchases for most food items

as those homeowners reporting a mortgage status. A similar pattern, but not nearly as pronounced, is observed for consumer units with incomplete income reporting. Given these reporting phenomena, utmost caution is advised in any further use of the tabulations in this bulletin for these two subgroups of consumer units.

The U.S. Beef Cow-Calf Industry, by Henry C. Gilliam Jr. AER-515. September 1984. 72 pp. \$2.75. Order SN: 001-019-00352-9 from GPO.

This comprehensive look at the U.S. beef cow-calf production industry finds that the number of beef cows fell by about one-fifth between 1975 and 1980 in response to sharp reductions in feeder cattle prices and increases in production costs during the midseventies. Photos and charts illustrate the text.

The U.S. Turkey Industry, by Floyd A. Lasley, William L. Henson, and Harold B. Jones. AER-525. March 1985. 72 pp. \$3.00. Order SN: 001-019-00385-5 from GPO.

Discusses trends in the thriving turkey industry, an industry which skyrocketed from a modest enterprise with a gross farm value of \$270 million in 1950 to a complex agribusiness with a gross farm value of \$1.25 billion in 1982. Turkey is now consumed year round, currently about 10.8 pounds

Characteristics of Farmer Cattle Feeding, by Roy N. Van Arsdall and Kenneth E. Nelson. AER-503. August 1983. 48 pp. \$3.75. Order SN: 001-000-04361-7 from GPO.

Now in its second printing, this report examines how the continuing trend toward commercial cattle feeding has reduced the number of farmer cattle feedlots to 113,000 as of 1980, down from 219,000 and 61 percent of the market in 1964. Explains why the number of farmer cattle feeders is expected to decline during the eighties.

per capita annually. The further processed product such as turkey rolls, pot pies, and frozen dinners is the fastest growing sector of the industry.

U.S. Hog Industry, by Roy N. Van Arsdall and Kenneth E. Nelson. AER-511. June 1984. 116 pp. \$4.50. Order SN: 001-000-04408-7 from GPO.

"... an excellent report ... presenting a statistical overview of the industry not available in this concise, readable form in any other publication. I believe my colleagues ... will share my enthusiasm." R. A. Easter, U. of Illinois, Urbana-Champaign

Livestock and Meat Statistics, 1983. SB-715. December 1984. 184 pp. \$4.50. Order SN: 001-019-00369-3 from GPO.

USDA's comprehensive data source for cattle and calves, hogs, poultry, and sheep and lambs includes production and inventories, number fed, marketings, slaughter, meat production, prices, per capita consumption, and trade information. Data at your fingertips on foreign trade, storage, and processing of livestock and livestock products. . . and up to a decade of historical data.

The hog industry has moved rapidly in the last 30 years from barnyard sideline to mechanized million-dollar operation. This report describes the most prevalent practices used today. Includes confinement production facilities, breeding, feeding regimens, waste management, and more. Charts, photos, and 54 detailed appendix tables.

The U.S. Poultry Industry: Changing Economics and Structure, by Floyd A. Lasley. AER-502. July 1983. 32 pp. \$3.25. Order SN: 001-000-04342-1 from GPO.

An excellent overview of changes in the U.S. poultry industry over the last 25 years. Examines why per capita consumption of poultry meat in 1981 nearly doubled since 1960, but retail prices rose only 74 percent for broilers, 67 percent for turkeys, and 59 percent for eggs. Vertical integration and technological advances are largely responsible for improved production and efficiency in the industry, enabling producers to hold down costs.
