Money in a Sequence Economy: A Correction*
by
Ross M. Starr
University of California, Davis

In Starrett's elegant and important study [1], there is an oversight in the statement of Lemma 1 (p. 446). The sense of the inequality in equation (23) and the definition of the interest factor $S_{w}^{n}$ are incorrect as printed. An alternative correct formulation of the lemma is:

Lemma 1': The problem (19) is equivalent to

$$
\begin{equation*}
\left(\mathrm{x}_{\mathrm{h}}^{\mathrm{W}}, \mathrm{y}_{\mathrm{h}}^{\mathrm{W}}\right) \text { maximizes } \mathrm{U}^{\mathrm{h}} \tag{22}
\end{equation*}
$$

subject to nonnegativity of $c_{h}, x_{h}^{W}, y_{h}^{w}$, and subject to $\sum_{w} \sigma_{w}^{n(h)}\left(q^{w} y_{h}^{W}-p^{W} x_{h}^{W}\right) \leq 0$
or, equivalently,

$$
\begin{equation*}
\Sigma \bar{S}_{\mathrm{w}}^{\mathrm{n}}\left(\mathrm{q}^{\mathrm{w}} \mathrm{y}_{\mathrm{h}}^{\mathrm{w}}-\mathrm{p}^{\left.\mathrm{W} x_{h}^{\mathrm{w}}\right) \leq 0, ~}\right. \tag{23B}
\end{equation*}
$$

where $\sigma_{\mathrm{w}}^{\mathrm{n}(\mathrm{h})} \equiv \Pi_{\mathrm{t}=\mathrm{w}}^{\mathrm{n}(\mathrm{h})-1} \mathrm{~S}^{\mathrm{t}}, \sigma_{\mathrm{n}(\mathrm{h})}^{\mathrm{n}(\mathrm{h})} \equiv 1$,
and $\quad \bar{S}_{\mathrm{W}}^{\mathrm{n}} \equiv \mathbb{I}_{\mathrm{t}=\mathrm{n}}^{\mathrm{w}-1} \frac{1}{\mathrm{~S}^{\mathrm{t}}}$, for n an arbitrary base date $(\mathrm{n} \leq \mathrm{b}(\mathrm{h})-1)$.
The original statement in [1] differs in the sense of the inequality and by using $S_{w}^{n}$ in place of $\bar{S}_{W}^{n}\left(S_{W}^{n} \equiv \Pi_{t=n}^{W} S^{t}\right) . \quad \sigma_{w}^{n(h)}$ does not appear in [1]. Recall that $S^{t}$ is an interest factor on the household's indebtedness at date t.

As a plausibility argument that a revision of Lemma 1 is required, recall that (23) derives from the requirement (18) that the household's net debt in its terminal period $d_{h}^{n(h)}$ be nonpositive $(\leq 0)$. The LHS of (23) is the weighted sum of debts accumulated at dates $w$, so the revised sense of the

[^0]inequality in (23') is appropriate. Vebt rifurited al eatly dates whomb carry a heavy weight of accumulated interest at $n(h)$ (the household's death date) compared with debt of w close to $n(h)$. Hence the revised definition of $\overline{\mathrm{S}}_{\mathrm{W}}^{\mathrm{n}}$ appears the more appropriate. The original formluation of $\mathrm{S}_{\mathrm{w}}^{\mathrm{n}}$ in [1] is inadequate since it leads to a LHS of
$$
\sum\left(\prod_{W=n}^{W} S^{t}\right)\left(q^{W} y_{h}^{W}-p^{W} x_{h}^{w}\right) \text { bearing no particular relationship to } d_{h}^{n(h)} \text {. }
$$

To prove lemma $1^{\prime}$, follow the prescription for proving lemma 1 in [1].
That is, substitute recursively for $d_{h}^{W}$ in

$$
\begin{equation*}
d_{h}^{\mathrm{w}+1}=d_{h}^{\mathrm{W}} S^{\mathrm{W}}+q^{\mathrm{w}+1} y_{h}^{\mathrm{w}+1}-\mathrm{p}^{\mathrm{w}+1} x_{h}^{\mathrm{w}+1} \tag{17}
\end{equation*}
$$

using

$$
\begin{equation*}
\mathrm{d}_{\mathrm{h}}^{\mathrm{b}(\mathrm{~h})-1}=0 ; \mathrm{d}_{\mathrm{h}}^{\mathrm{n}(\mathrm{~h})} \leq 0 \tag{18}
\end{equation*}
$$

Recall that $b(h), n(h)$ are respectively the first and last dates of the household's life. We have

$$
\begin{aligned}
& d_{h}^{n(h)}=d_{h}^{n(h)-1} S^{n(h)-1}+q^{n(h)} y_{h}^{n(h)}-p^{n(h)} x_{h}^{n(h)} \\
& =d_{h}^{n(h)-2} S^{n(h)-2} S^{n(h)-1}+\left(q^{n(h)-1} y_{h}^{n(h)-1}-p^{n(h)-1} x_{h}^{n(h)-1}\right) S^{n(h)-1} \\
& \quad+q^{n(h)} y_{h}^{n(h)}-p^{n(h)} x_{h}^{n(h)} \\
& =\cdots \leq 0
\end{aligned}
$$

That is, $d_{h}^{n(h)}=\sum_{w}\left(\pi_{t=w}^{n(h)-1} S^{t}\right)\left(q^{w} y_{h}^{w}-p^{w} x_{h}^{w}\right) \leq 0$. This is precisely (23A).
Birth and death dates, $b(h), n(h)$, depend on the household, but it is
convenient to have a version of (23A) independent of these dates. Choose the
base date $n$ smaller than $b(h)-1$ for $a l l h$. Note that

$$
\bar{S}_{w}^{n} \equiv\left(\prod_{t=n}^{n(h)-1} \frac{1}{S^{t}}\right) \sigma_{w}^{n(h)}
$$

Then (23B) comes from (23A) by multiplying through by $\left(\prod_{t=n}^{n(h)-1} \frac{1}{S^{t}}\right)$. This completes the proof of lemma $1^{\prime}$.

The definition of $\bar{S}_{W}^{n}$ is formally very similar to $S_{w}^{n}$ in [1] and may
represent what that term was intended to convey. $S_{w}^{n}=\frac{S^{w}}{S_{w}^{n}}$ Theorems 2 and 3 follow as before. In the proofs we substitute $\bar{S}_{w}^{n}$ for $S_{w}^{n}$. Note that in Theorem 2, where lifetimes differ, this substitution is obligatory to make use of the base date $n$ which is common to the households though their lifetimes differ. In Theorem 3, where all lifetimes coincide, $S_{w}^{n}$ can be replaced in the proof by $\bar{S}_{w}^{n}$ or by $\sigma_{w}^{n(h)}$.
