## Stata Press Copy Editors

DAVID CULWELL and DEIRDRE SKAGGS

The *Stata Journal* publishes reviewed papers together with shorter notes or comments, regular columns, book reviews, and other material of interest to Stata users. Examples of the types of papers include 1) expository papers that link the use of Stata commands or programs to associated principles, such as those that will serve as tutorials for users first encountering a new field of statistics or a major new technique; 2) papers that go “beyond the Stata manual” in explaining key features or uses of Stata that are of interest to intermediate or advanced users of Stata; 3) papers that discuss new commands or Stata programs of interest either to a wide spectrum of users (e.g., in data management or graphics) or to some large segment of Stata users (e.g., in survey statistics, survival analysis, panel analysis, or limited dependent variable modeling); 4) papers analyzing the statistical properties of new or existing estimators and tests in Stata; 5) papers that could be of interest or usefulness to researchers, especially in fields that are of practical importance but are not often included in texts or other journals, such as the use of Stata in managing datasets, especially large datasets, with advice from hard-won experience; and 6) papers of interest to those who teach, including Stata with topics such as extended examples of techniques and interpretation of results, simulations of statistical concepts, and overviews of subject areas.

The *Stata Journal* is indexed and abstracted by *CompuMath Citation Index*, *Current Contents/Social and Behavioral Sciences*, *RePEc: Research Papers in Economics*, *Science Citation Index Expanded* (also known as *SciSearch*), *Scopus*, and *Social Sciences Citation Index*.

## Stata tip 112: Where did my p-values go? (Part 2)

Maarten L. Buis  
Wissenschaftszentrum Berlin für Sozialforschung (WZB)  
Berlin, Germany  
maarten.buis@wzb.eu

In a previous Stata tip (Buis 2007), I discussed how to recover  $t$  statistics,  $p$ -values, and confidence intervals for regression parameters by using the results that are returned by an estimation command. In this tip, I continue that discussion by showing how  $p$ -values can be recovered for other tests that are sometimes displayed by estimation commands. For example, consider a linear regression as estimated by `regress` (see [R] `regress`). It displays the results of an  $F$  test of the hypothesis that all coefficients except the constant are equal to 0. However, `regress` only returns the  $F$  statistic (`e(F)`), the number of model degrees of freedom (`e(df_m)`), and the number of residual degrees of freedom (`e(df_r)`); it does not return the  $p$ -value. If you need the  $p$ -value, you can use the function `Ftail()` to look up the appropriate  $p$ -value, as illustrated below.

```
. sysuse auto
(1978 Automobile Data)
. regress price mpg i.rep78
      Source |       SS           df          MS
Model | 149020603          5  29804120.7
Residual | 427776355         63  6790100.88
Total | 576796959         68  8482308.22
      Number of obs =      69
      F(  5,      63) =   4.39
      Prob > F      =  0.0017
      R-squared     =  0.2584
      Adj R-squared =  0.1995
      Root MSE      =  2605.8
      price |      Coef.        Std. Err.          t      P>|t|
      mpg | -280.2615      61.57666      -4.55      0.000      -403.3126      -157.2103
      rep78 |
      2 | 877.6347      2063.285      0.43      0.672      -3245.51      5000.78
      3 | 1425.657      1905.438      0.75      0.457      -2382.057      5233.371
      4 | 1693.841      1942.669      0.87      0.387      -2188.274      5575.956
      5 | 3131.982      2041.049      1.53      0.130      -946.7282      7210.693
      _cons | 10449.99      2251.041      4.64      0.000      5951.646      14948.34
      . display Ftail(e(df_m), e(df_r), e(F))
      .00171678
```

Often such additional tests are based on the chi-squared distribution. In that case, we can use the `chi2tail()` function to recover the  $p$ -value. An example is given below. In this example, the test statistic is returned in `e(chi2_c)`. The number of degrees of freedom for this test is not returned by `biprobit` (see [R] `biprobit`), but we know that in this case the number of degrees of freedom has to be 1.

```

. webuse school
. biprobit private vote logptax loginc years, nolog
Bivariate probit regression
Number of obs      =        95
Wald chi2(6)      =       9.59
Prob > chi2       =     0.1431
Log likelihood = -89.254028

```
