## VOLUME II: STATISTICAL APPENDIX

### TABLE OF CONTENTS

#### INTRODUCTION

Table 1: Commercial Fisherman Study Regions

Figure 1: State of Alaska and Study Regions

- 2: Southeast Region
- 3: Prince William Sound Region
- 4: Cook Inlet Region
- 5: Southwest Region
- 6: Bristol Bay Region
- 7: Arctic-Yukon-Kuskokwim Region

#### APPENDIX A: REGIONAL POPULATION AND GENERAL CHARACTERISTICS

- Tables A-1 -- A-6: Total Population Distribution, 1839-1970 (for each study region)
- Tables A-7 -- A-12: General Social and Economic Characteristics of Population, 1960 and 1970 (for each study region)

#### APPENDIX B: TOTAL EMPLOYED WORKFORCE, STATE OF ALASKA AND STUDY REGIONS

- Tables B-1 -- B-16: Total Employed Workforce by Industry and Month, 1970 and 1965 (for State and each study region)

#### APPENDIX C: COMMERCIAL FISHING EMPLOYMENT BY REGION, TYPE OF GEAR AND SPECIES, 1965-1970

- Tables C-1 -- C-18: State and Regional Fishermen Employment, by Species, Gear, and Months, 1965 through 1970 (for State and each region)

#### APPENDIX D: GEAR FISHED BY REGION, TYPE AND SPECIES, 1965-1970

- Tables D-1 -- D-6: Gear Fished by Region, Species, and Month, 1965 through 1970 (for each region)

#### APPENDIX E: ANNUAL AND MONTHLY CATCH BY REGION, SPECIES, AND GEAR, 1965-1970.

- Tables E-1 -- E-12: Monthly Catch by Region, Species, and Gear, 1965 through 1970 (for each region)
- Tables E-13 - E-14: Annual Catch by Region, Species, and Gear, 1965 through 1970 (for each region)

#### APPENDIX F: SOCIAL AND ECONOMIC CHARACTERISTICS OF COMMERCIAL FISHERMEN

Alaska Department of Revenue Information

Alaska Department of Labor Information

- Table F-11: Bristol Bay Region -- Resident Fishermen by Primary Occupation -- 1970
- Table F-12: Bristol Bay Region -- Resident Fishermen by Age, Sex, and Education -- 1970
- Table F-13: Bristol Bay Region -- Resident Fishermen -- Mobility by Family Size and Education -- 1970
- Table F-14: Bristol Bay Region -- Resident Fishermen by Occupational Experience and Training -- 1970
- Table F-15: Arctic-Yukon-Kuskokwim Region -- Resident Fishermen by Age, Sex, Educational Attainment -- 1970
- Table F-16: Arctic-Yukon-Kuskokwim Region -- Resident Fishermen by Primary Occupation and Employment Status -- 1970

## INTRODUCTION

This contract required the collection and generation of a body of statistical data which would provide a basis for the study of the Alaska salmon fishermen. In addition to arriving at a count of the number employed in the harvesting of salmon, data was required which would locate their activities geographically in relation to specific resource and economic regions, identify type of gear used, and quantify their activities in terms of man-months, productivity and income. Furthermore, employment in salmon fisheries had to be analyzed in the context of all fisheries and the total regional economies and key socio-economic characteristics of the fishermen identified in order to analyze the impacts of changes in salmon harvesting employment due to gear limitation or other regulatory policies and programs. In compiling the data to be used, annual statistical reports and other published materials provided only a start. Primary or original sources such as agency worksheets, computer print-outs and internal records were the principal sources and in certain instances (e.g. income data from Department of Revenue sources) major data generation projects were required. In order to serve the specific purposes of this study, much of these data had to be subjected to careful evaluation and some modification or were used as the basis for making estimates of required data not otherwise available.

The first reason for presenting this series of statistical appendices, therefore, is to provide the reader of Volume I with source citations. These are given for each table and each appendix is introduced with a methodological discussion further indicating the degree to which the "authority" is the official agency reports or the judgement, selectivity or interpretation of the present researchers. The citations and discussions will also assist the reader in any research for additional raw materials as they indicate "blind alleys" and point toward sources of further unpublished materials.

A second reason for presenting these appendices is our recognition that the analysis in Volume I does not begin to cover the subject nor exhaust the analytical possibilities of the data compiled. It is hoped that the availability of this volume will encourage further study to elaborate and expand this analysis or revise and redirect it into more relevant channels. Because this is the first research effort of this type on this scale attempted in Alaska, furthermore, much of the data base is preliminary with some of the gaps filled by estimates. As more effort is directed toward the study of the socio-economic implications and impacts of fisheries management policy changes it can be anticipated that better and more complete data will become available. By reference to these appendices it will be possible to up-date and revise the analysis made in Volume I and elsewhere on the basis of the present data.

Finally, the sources cited and the methodological discussion represent an extended acknowledgement of the degree to which the co-operation of operating agencies and their staff members contributed to the conduct of this research effort. Even though many individuals and agencies have devoted time and energy to producing data for this study, the responsibility for selection, compilation and computation of the series rests with the authors.

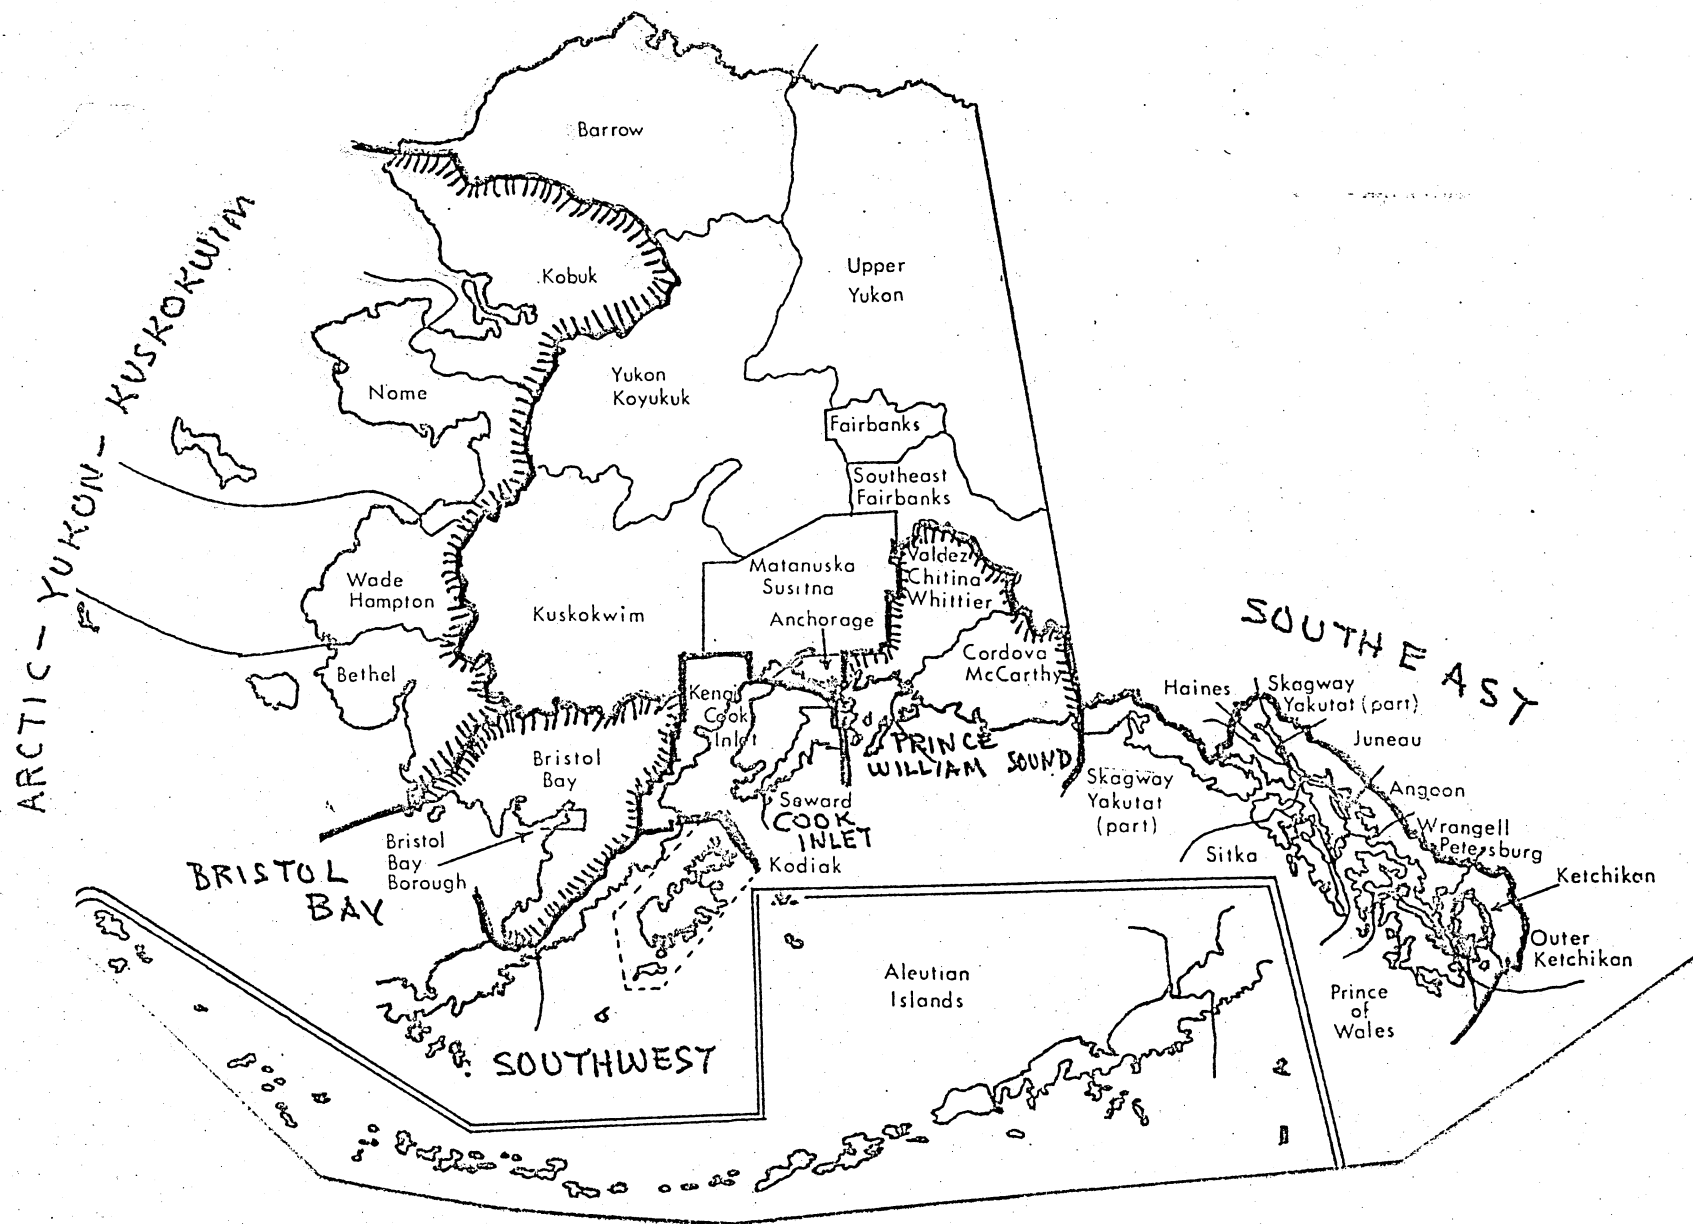

The several appendices are organized to embrace data of the same general type or from the same source. They are arranged roughly in order from the most general (regional population) to the most specific (socio-economic characteristics of fishermen). The basis for selection of the regional units for purposes of data compilation and analysis is more fully discussed in Chapter II of Volume I. The following table is reprinted from that volume to define these regions in terms of statistical units used in published sources. The maps used in each of the regional chapters are also duplicated here as a further guide to the use and interpretation of the statistical series.

## APPENDIX A: REGIONAL POPULATION AND GENERAL CHARACTERISTICS

The estimates by J. Mooney (1928) of indigenous population as of the period of first European contacts (circa 1740) and as related to specific geographic areas by A.J. Kroeber (1939) were used in calculating the earliest indigenous population statistics used in this study.<sup>1</sup> For each of the major tribal designations used by Mooney, Kroeber designates a specific land area and calculated population densities supportable by natural resources and aboriginal technology drawing upon a wider range of more recently available records and studies. W.H. Oswalt (1967) has provided more detailed and revised estimates of Eskimo and Aleut population by tribal areas, and G.W. Rogers (1962) for Tlingit and Haida areas.<sup>2</sup> Population data reported during the Russian period are too fragmentary to provide a basis for presenting the probable population levels for much of Alaska, although estimates by Father Veniaminov (circa 1835) are probably reliable for the Aleutian Islands, Alaska Peninsula, Kodiak, and the southeast Alaska regions.<sup>3</sup> These and other early census have served as a basis for any estimates prior to 1880 used in this study.

The regular decennial census of the United States, extended to Alaska in 1880, constitutes the principal source of the population distribution and characteristics used in this study. However, these had shortcomings. Due to difficulties of travel, population reports for 1880 and 1890 were based upon

Ivan Petroff, Report on the Population, Industries, and Resources of Alaska, Census Office, U.S. Department of the Interior (1884).

counts made over extended periods of time within the subject years and probably did not cover all populated places. The traditional seasonal movements of the indigenous population during the course of a year, therefore, introduced the possibilities of both double counting and missing population in places which were seasonally vacated. With the establishment of the salmon canning industry along the southern coastal areas from Ketchikan to Bristol Bay in the 1880's, the summer influx of non-indigenous workers in salmon fishing and canning introduced further elements lessening the comparability of these earlier with more recent data. The first attempt to present population as of a given date (June 1, 1900) was based upon an enumeration taken on the upswing of the seasonal summer activities. Subsequent census dates (December 31, 1909; January 1, 1920; October 1, 1929 and 1939; April 1, 1950, 1960 and 1970) fell within the off-season period of the calendar and are more representative of what would be considered "resident" population. No attempt was made in this study, however, at seasonal adjustment for earlier census beyond indicating obvious overcounts.

The regions in this study were defined as combinations of the 1970 census divisions. The previous census reports presented area data on the basis of different geographic units, however, and for purposes of comparability it was necessary to adjust the published data. Data in the 1880 and 1890 census were reported for all known populated places, and the area assignments in this study were made by identifying all places located within the boundaries of the 1970 census divisions. Alaska was divided into only two major divisions -- northern and southern -- in the 1900 report, with some data published for a number of specific places. The specific places listed were identified as to location within the regions of this study, and, in combination with an examination of trends before and after 1900 and contemporary mission and government reports, served as indices for estimating the total population for each of the geographic areas embraced by the 1970 census divisions.

Commencing with the 1910 census, the recording districts established by the United States District Courts in Alaska were adopted as the census districts. The boundaries of these districts were changed by the courts over time in response to population shifts and economic change to best serve the courts' purpose. The 1960 census adopted as its census districts the 24 election districts established in the Constitution of the State of Alaska. The 1956 Constitutional Convention, in defining the boundaries of these units, attempted to arrive at the most appropriate "natural" areas reflecting not only geographic factors but social and economic as well. Reapportionment following the 1960 census resulted in some changes in election district boundaries (principally combinations of rural areas losing populations since 1950) and the 1970 census divisions were represented by organized boroughs (an Alaskan equivalent of counties) and election districts. For the period from 1929 through 1970 most of these boundary changes took place within the overall boundaries of the study's regions, but for 1910 and 1920 small areas of a few districts in the northwest lay outside the regions of the present study. Population estimated for these external areas simply was deducted from the total of the recording districts drawn upon.

The 1900 census was the only one requiring more than a minor degree of estimated redistribution unsupported by detailed enumeration by place and other means of direct identification of population location. There were minor complications presented by boundary changes between 1920 and 1929, but boundary changes after 1929 were in the nature of relatively simple consolidations of smaller recording districts, and the 1880 and 1890 reports gave complete listing of all places enumerated.

Population distribution within the regions is presented in terms of natural geographic areas or more recent political sub-divisions (1970 borough boundaries) and a few significant places. Aboriginal place names have persisted down to the latest census reports, even when the locations have not also done so. There have appeared major concentrations of population at

specific aboriginal locations in some reports for which no further reports are made or only minor populations at places with similar spelling appear in other years. The changing patterns of concentration and dispersion of aboriginal population over time probably could be directly attributed to changes in the natural resource base. The most significant local areas, therefore, appeared not to be specific places but larger natural areas such as river basins, drainages into major bays, etc., which delineated the major "tribal" areas described in the early census and other reports. The exception has been the southeast region where both place names of the principal villages and their locations have been constant over time with changes being restricted to the consolidation of the Haida and southern Tlingit population.

The non-indigenous settlements came into existence for purposes of national defense, trade, natural resource collection and processing, and governmental and church administration. Those itemized in the following tables for the study's regions were selected for their present or past major significance or their relative permanence. For most places data are the population reported within the incorporated boundaries of these communities only, and where appropriate, the immediately adjoining population are presented as "suburbs" or "environs".

Defense stations were established to maintain law and order or territorial claims at the turn of the century

and some maintained continuously in connection with operation of telegraph and wireless systems. Prior to World War II the numbers of persons involved, however, were small and these establishments were of limited local significance. No attempt was made, therefore, to uncover data on population on defense bases or stations prior to the 1950 census.

For the entire period of census coverage (1880-1970) a wealth of data on general and socio-economic characteristics of population are available. The task of processing this to achieve a suitable degree of continuity and comparability on the basis of this study's regional units, however, was beyond the scope of

time and funding available. Accordingly, a summary of key population characteristics was compared only from the 1960 and 1970 census reports. These are sufficient to describe the present condition of the population of each region and indicate the degree and direction of basic changes in each.

APPENDIX B: TOTAL EMPLOYED WORKFORCE -- STATE OF ALASKA AND  
STUDY REGIONS

The tables in this appendix present total employed workforce (including military personnel) by industry and month for 1965 and 1970 for the State of Alaska and the regions of this study. The sources for these data are the published reports of the Alaska Department of Labor, Employment Security Division, Research and Analysis Section and agency worksheets and records and the fisheries employment estimates made in this study. The Department publishes annually monthly estimates of total civilian employment and unemployment for each of Alaska's twenty-four labor areas (the original election districts defined by the State Constitution), Alaska Workforce Estimates by Industry and Area. Comparable estimates are provided with more industrial detail and corresponding payroll data for nonagricultural wage and salary employment in a Statistical Quarterly. On an annual basis the Department also publishes Current Population Estimates By Election District, Alaska, which for present purposes provided the numbers of uniformed military personnel stationed in Alaska on July 1 of each year and their geographic distribution.

The annual workforce estimates published by the Department are based upon definitions and methods used nationally in the monthly household survey conducted for the Bureau of Labor Statistics by the Bureau of the Census. The workforce estimates show employment by the place in which the work was performed, however, and in this respect differs from the census of households in which employment reflects place of permanent residence of the worker. Total employment includes self-employed persons, unpaid family workers, domestics, agricultural workers, and workers involved in work stoppages, as well as nonagricultural wage and salary workers. This last group is presented separately and subdivided into major industrial classifications. Data was obtained from insured employment reports filed quarterly by private employers (and summarized in the Statistical Quarterly)

and the unemployment insurance program covering all Federal employees in Alaska. State and local government employment is from reports by these units to the Employment Security Agency under the Current Employment Statistics program of the U.S. Bureau of Labor Statistics. Non-covered employment was estimated from special surveys, projections of 1960 census data and statistics of the Old Age and Survivors Insurance Program. In order to comply with nondisclosure regulations, the published employment data by districts is not complete in its industrial classification breakdown. When these districts were combined into the regional units of this study, however, the number involved were large enough to permit a more complete enumeration. These additional details were obtained from the agency worksheets and printouts.

The following adjustments were made in the Department of Labor workforce estimates for this study. Because of the importance of the Department of Defence in the Alaska economy the number of uniformed military personnel (from the Current Population Estimates by Election Districts) stationed in the State and each region was added to the total employed workforce. It was assumed that the number of personnel was at the July level for all months of every year. From data in the Statistical Quarterly monthly civilian employment in the Department of Defense was separated from Federal government and combined with military personnel to arrive at a special classification in the tables of "Government, Federal-military." The classification "Government, Federal-civilian" includes all agencies except the Department of Defense which are engaged in essentially civilian or non-military functions. From the unpublished worksheets of the employment estimates added to nonagriculture wage and salary employment to arrive at total employment, all agricultural employment (including unpaid family workers) was separated and listed under "commodity-producing industries" and domestics were added to "services" under "distributive industries." The Department's commercial fishermen estimates in this category were based upon April 1960 employment projections. These estimates were

replaced, therefore, by monthly estimates made in this study and listed under "commodity-producing industries." The balance of this category remaining after separation of agricultural workers, domestics and commercial fishermen is included in the following tables under "unclassified employment."

APPENDIX C: COMMERCIAL FISHING EMPLOYMENT BY REGION, TYPE OF  
GEAR AND SPECIES, 1965-1970

The methodology used on estimating commercial fishermen is a further development of that originally designed by Richard Listowski in a preliminary study of the subject in 1971.<sup>1</sup> "Fishermen employment" as defined in the following tables is the average number of persons employed each month on boats which make sales of fish. "Boat" as used here and elsewhere in this study also includes set net and beach seine sites (refer to discussion in Appendix E). Canadian halibut fishermen making landings in Alaska were not included in the employment estimates (refer to discussion on halibut fishery below).

Employment is distributed among the study regions (geographic areas including offshore waters) according to where the fish were caught, not the port in which the sale was made or the home port of the vessel. Employment is allocated on the basis of where the work (the catching of fish) was performed, in other words, and not on the basis of where the money transaction took place or where the income went. "Employment" statistics are estimates using fish landings as an index (see Appendix D). These indexes do not measure actual intensity of activity during the subject week (i.e., full-time and part-time fishermen count the same). All of these qualifications are consistent with the Department of Labor practices in the study of employment in other industries. Place of work and only indexes of monthly employment (workers in key weeks) are used. The data in this study, therefore, will be consistent with other employment data and studies. The method of employment allocation, however, does not accurately reflect the location of all forms of employment directly attributable to fishing. For example, it does not take into account the possibility (or probability in some areas) that in-port work on boats and overhaul of gear by crew members might take place in a port of one of this study's regions while the fishing took place in another region.

# Department of Fish and Game Data

The basic sources for these employment estimates were the Department of Fish and Game final history printouts of fish ticket information and International Pacific Halibut Commission data. These sources were the basis for estimating the number of "boats" making landings each month as discussed fully in Appendix E. These estimates were translated into employment by multiplying by appropriate crew factors (average size of crew for each type of gear and species in each of the study's regions and sub-regions) estimated by experienced field personnel of the Alaska Department of Fish and Game.<sup>2</sup> The crew factor estimates are shown in the following table.

	South-eastern	Prince William Sound	Cook Inlet	Kodiak	Aleutians	Bristol Bay	Arctic-Yukon-Kuskokwim

 Ron Regnart, Regional Supervisor, Arctic-Yukon-Kuskokwim

### Halibut Fishery

Numbers of men employed in the halibut fishery, by month and by region, were provided by the International Pacific Halibut Commission, since the Alaska Department of Fish and Game does not record this information. Figures were for "The United States set-line halibut fleet fishery in Alaskan waters." Alaska boats selling in Prince Rupert were included in the southeast count. Canadian boats catching fish off the Alaska coast and landing them in Alaska were omitted. A high proportion of halibut landed in the Central Region is by Canadian boats.

### Department of Labor Data

A small number of fishermen, about 200 during peak months, have been covered by unemployment insurance, and therefore Department of Labor covered employment data was not very useful. Beginning January 1, 1972, however, all crewmen are to be covered by U.I. Vessel operators will not be included unless they are employed by someone other than themselves. As a consequence, the following information will become available on Department of Labor 202 printouts: Area, number of firms engaged in fishing, monthly employment, average pay and total wages. The information will also be printed out by firm account number, but this last information is confidential and cannot be released by the Department. First quarter, 1972, information was not available at the time this report was being prepared and hence the quality of this data is still unknown. Boats departing from Washington or Oregon probably will be covered under the laws of those states and, therefore, won't appear on the Alaska 202 printouts even though the vessel operator may be an Alaskan resident or he may pick up crewmen in Alaska.

#### APPENDIX D: GEAR FISHED BY REGION, TYPE AND SPECIES, 1965-1970

The tables in this appendix present the average number of "boats" (including set net and beach seine sites as "boats") fished per month by species for each of the study's regions. The figures represent "boats," not units of gear or men. A crab boat fishing 100 pots and employing three men, for example, would be one unit for purposes of these tables. Sources for these tables were the Alaska Department of Fish and Game final history printouts of fish ticket information supplemented by International Pacific Halibut Commission data.

##### Alaska Department of Fish and Game -- Fish Ticket Data

The data in the gear tables for all species except halibut come directly from the Alaska Department of Fish and Game printouts listing boats making landings per week or month. The gear tables differ from the fishermen employment tables in Appendix C only by the crew factors applied to arrive at the employment estimates. Because of variation in gear factors by regions, the high week dates in the gear tables may also differ from the high week dates in the employment tables.

When a boat sells a load of fish to an Alaskan buyer, information about total weight, species, gear and area where caught must be recorded on a fish ticket, one copy of which goes to the Alaska Department of Fish and Game. Computer printouts of the fish ticket data provide an unduplicated count by area of boats making landings during any given week (for salmon) or month (for other fish and shellfish). The printouts show, for example, that in the 29th week 1249 boats using drift gillnet gear made 3054 landings of salmon caught in Bristol Bay.

Landings of shellfish and of fin fish other than salmon are recorded on a monthly basis. Salmon landings are recorded on a weekly basis and weeks were averaged together to get monthly figures for salmon. An initial attempt to use "key weeks" instead of monthly averages for salmon was not feasible. The week containing the twelfth day of the month was used to represent the

number of boats fishing in that month, a practice much used in reporting employment data for other industries. Due to the erratic nature of fish runs, official openings and closings of seasons and other factors, however, this proved to be an inadequate and misleading method of reporting monthly fishing activity.<sup>1</sup> Since the number of boats landing salmon per week is extremely variable, for 1968 and later years annual high week information is also shown to give a better idea of the maximum size of fishing fleet activity.

The fish ticket printouts are available by larger or smaller area breakdowns. When smaller area information is used, the possibility of double counting exists because some boats report catches from different areas within the same week or month. For that reason "district" and "regional" printouts were used. The regions and sub-regions used for this study are generally the same as the Department of Fish and Game regions and management districts, an exception being Aleutian sub-region in these tables which combines the management districts of the Aleutian Islands and Chignik.

#### International Pacific Halibut Commission Data

The number of halibut boats fishing per month had to be estimated because information received from the IPHC was in terms of men rather than boats. The Commission provided a total count for the year 1969 of boats and of crewmen in the southeastern and southcentral regions which yielded an average crew of 3.86 men per boat in southeastern and 4.30 men per boat in the southcentral region. Monthly halibut fishermen figures for 1965

<sup>1</sup> Comparison of key week and monthly average salmon fishermen counts in Bristol Bay, for example, resulted in the following:

	<u>Using Monthly Average</u>			<u>Using Key Weeks</u>		
	<u>June</u>	<u>July</u>	<u>Annual Average</u>	<u>June</u>	<u>July</u>	<u>Annual Average</u>
1965	2050	3180	440	460	4440	410
1966	1960	3650	500	690	4530	460
1967	1970	2560	410	850	2560	350
1968	2000	2750	440	860	3420	390
1970	2240	2980	450	650	3290	340

through 1970 were divided by these average crew figures to arrive at an estimate of the number of boats engaged in fishing each month.

#### Minor Fisheries

Fish ticket printouts list separately each species of fish. Hence boats bringing in several kinds of fish will appear on more than one listing. For the employment statistics, boats landing species other than salmon, halibut, shrimp, dungeness crab, king crab, or herring were counted only when they were judged not to be incidental fish.<sup>2</sup> For this reason most of what the Alaska Department of Fish and Game calls "miscellaneous fish" were omitted. Those retained as part of the employment count include:

Scallops -- Counted in 1968 and thereafter, when scallops had become a separate fishery.<sup>3</sup>

Tanner Crab -- Counted in 1969 and thereafter, but assumed to be partially incidental to king crab catches. When king crab season was closed, 100% of tanner crab boats were counted. When king crab season was opened, tanner crab boats were counted as follows: 0% in Southeastern, 20% in Cook Inlet, 10% in Prince William Sound, Kodiak and the Aleutians.

Black Cod (Sablefish) -- These are largely but not entirely incidental to halibut catches. None were counted in the central Region. In Southeastern they were counted at 100% for March, April, October, and November, when halibut season was closed. None were counted in May and June and a very few in July, August, and September.

---

<sup>2</sup> Some checking of overlapping fisheries was done via the "Alaska Department of Fish and Game" (boat license number) printouts, The same number appearing on two species lists in the same month indicates overlap.

<sup>3</sup> Monthly boats making landings in 1968 estimated from annual boat data and monthly poundage landed.

Whitefish, Char,  
Sheefish, Northern Pike -- These are caught in the Bristol Bay  
and Arctic-Yukon-Kuskokwim regions. They are largely  
incidental to salmon when salmon season is open, and  
two or three species are usually caught by the same  
boat. Hence the species listing with the largest  
number of boats was used to represent them all, and  
during the salmon season only 5% of this number was  
used.

Razor Clam -- Razor clam diggers were not counted due to  
unavailability of monthly figures for most years.

The monthly figures for 1969 and 1970 are as follows:

YEAR	MONTHS											
1969	1	2	3	4	5	6	7	8	9	10	11	12
Prince William Sound			1	8	5	18	13	8	1			
Kodiak					3	1	1					
Aleutians							1	1	1			
1970												
Prince William Sound			2	3	9	7	5	4		2		
Kodiak				1	5	5	2					

#### Tenders and Packers

Crews of tenders and packers were not included in the  
count of fishermen. A check of the 1970 Vessel Register shows  
the following:

Area	Keel Length	
	35 Feet or less	Over 35 feet
Alaska Total	96	332
Southeastern Total	2	57
Central Total	27	97
Prince William Sound	14	38
Cook Inlet	5	22
Kodiak	6	25
Aleutians	2	12
Bristol Bay	7	66
Arctic-Yukon-Kuskokwim	33	15

### Southeastern Trollers

The southeastern salmon troller presents several unresolved problems: (1) Trollers fishing the Fairweather grounds or other areas distant from a buyer may sell only once every ten days or so, and thus be under-represented in the weekly count of boats making landings. (2) The sport-commercial fishermen are people employed in other jobs who buy commercial fishing licenses and sell some of the salmon they catch on weekends or during their paid vacations. They make relatively few landings during a season and their average catch is smaller than that of the full-time commercial fishermen. Their inclusion, therefore, tends to overstate the estimate of commercial fishing.

The excess of trollers counted who are sports-commercial fishermen may be somewhat balanced by the under-count of Fairweather and other distant trollers. In 1970 a total of 1,906 commercially licensed troll boats made landings during the year. During the highest recorded week, however, only 787 boats made landings. Although the weekly figures have been used in these tables, there is no assurance that they accurately represent the number of full-time commercial troll fishermen actually fishing at that point in time.

[a] High week figures are given for salmon gear only. For other fisheries, information was obtained on a monthly basis.

[b] Drift and set gillnet figures for Arctic-Yukon-Kuskokwim include small amounts of char, whitefish, sheefish and northern pike fishing, in addition to salmon because the same gear is used.

[c] Gear used for Tanner crabs may be the same as is used for king crab.

[d] Black Cod Long Lines are usually the same gear as is used for halibut, but with smaller hooks.

[e] Number of halibut boats estimated from data on number of men provided by the International Pacific Halibut Commission.

- [1] High week figures are given for Salmon gear only. For other fishermen, information was obtained on a monthly basis.
- [2] Arctic-Yukon-Kuskokwim set gillnet figures include small amounts of char, whitefish, northern pike, and sheefish fishing in addition to salmon because the same gear is used.
- [3] Gear used for Tanner Crabs may be the same as is used for King Crabs.
- [4] Estimated.
- [5] Black Cod long lines are usually the same gear as is used for halibut, but with smaller hooks.
- [6] Number of Halibut boats estimated from data on number of men provided by the International Pacific Halibut Commission.

APPENDIX E: MONTHLY AND ANNUAL CATCH BY REGION, SPECIES AND GEAR, 1965-1970

Data for shellfish catch by region, gear and month are from annual Alaska Catch and Production, Commercial Fisheries Statistics, Statistical Leaflet, Alaska Department of Fish and Game. All other species except halibut were taken from Department weekly printouts of catch compiled from fish tickets filed by commercial fishermen. When fish is sold, weights listed are as reported on tickets and refer to region or area of catch, not landing areas (see discussions in Appendixes C and D).

Halibut data are not included.

APPENDIX F: SOCIAL AND ECONOMIC CHARACTERISTICS OF COMMERCIAL  
FISHERMEN

A major portion of the study was devoted to extracting social and economic data on commercial fishermen from Alaska individual income tax records of the Alaska Department of Revenue, the information collected by a comprehensive manpower skill survey conducted in rural Alaska by the Employment Security Division, Alaska Department of Labor primarily in 1970, and wage dispute settlements involving commercial fishing vessel operators and their crews as recorded in the Wage and Hour Division, Alaska Department of Labor. The statistics derived from these three sources varies in coverage. Department of Revenue source yielded data as resident and non-resident "vessel operators" only. Practical factors complicated collection of crew member data. The Department of Labor data applies only to residents but includes all persons engaged in fishing.

Alaska Department of Revenue Information

The objective of this investigation was to develop gross and net income statistics for commercial fishermen classified by residency, gear, area fished and number of dependents from Alaska Individual Income Tax Returns and attached profit and loss statements and other schedules. The calendar year 1969 was chosen for processing because this was the most recent year for which the Department assumed all returns to be received had been filed and the records were in final order. 1969 was also the reference income and employment year for the 1970 census reports which might provide useful cross-references. Because the tax records are not maintained on a data processing system, a manual system was devised to identify the commercial fishermen tax files and transfer the required data from tax forms to two sets of ISEGR questionnaires (see attachments for samples of the questionnaires and the tax forms). Because of non-disclosure regulations it was necessary to contract all of this work to be done by certified staff of the Department of Revenue.

All tax records and returns are filed by the name of the taxpayer only. The first task, therefore, was to devise a means for identification of commercial fishermen from names. This was done in two stages. The 1970 - Alaska Vessel Register, Alaska Department of Fish and Game, was used for the first stage trace of files. This document gives the names of any individual registered as a commercial fishing vessel operator (not owner). It was assumed that the registered operator would file the profit and loss statement (Schedule C) for the vessel(s). This might not be true in all cases, but this was the only feasible route to collecting the Schedule C forms. These tax forms contain data concerning gear fished along with the gross income, and net profit or loss of the registered operator and his residency. They also contain the names and gross income of the crew members, which in turn gave access to their income tax records. Files were pulled on a sample of individuals listed in the "Alaska Vessel Register; Part III, Name of Operator." Each file pulled was examined by Department of Revenue staff and the required data transferred from the tax schedules to ISEGR Questionnaire 1 and 2. Age and area fished by these individuals was taken from the Alaska Department of Fish and Game commercial license printout.

The second stage in locating commercial fishermen tax files used Schedule C form which lists crew members to whom the operator paid wages or shares. The name of each crew member along with his gross income and operator's gear(s) were recorded on Questionnaire 2. After the questionnaires were placed in alphabetical order, a check was made to locate and then combine on one questionnaire those crew members who worked on two or more boats. The tax returns of the individuals on this list were then pulled from the files.

The statistics presented in this appendix are based upon a sample of 3,325 out of a recorded total of 9,972 license holders in 1969. The sample was made in a semi-random manner (including a loss of approximately ten percent in a fire which destroyed our office in February) from approximately seven thousand forms pulled from the Department of Revenue files. A high proportion of non-filers (e.g., 27% of non-resident license holders did not file tax

returns), however, constitutes a bias. The manual extraction of data proved to be more laborious, time consuming, and costly (the labor was performed on an over-time basis) than anticipated and it was decided, therefore, to abandon extraction of data for crew members after slightly more than one hundred had been pulled. The sample is limited to vessel operators therefore, and does not cover all fishermen as originally planned.

In addition to the limitations of coverage only to vessel operators, the results fell short of our anticipations in other details. No distinction was made on the tax forms between set and drift gillnets and among kinds of crab fishing. It was not possible to classify the forms by the sub-regions of the Central region. Additional information on the operators who had filed might have been obtained from the tax forms, but was not available due in part to frequent failure of taxpayers to fill out all requested information and obvious variation in understanding of accounting principles and interpretation among fishermen. The cumbersomeness of the hand operations and the lack of direct supervision (due to disclosure safeguards) undoubtedly resulted in errors of transcription and interpretation. The greatest source of discouragement, however, was due to difficulties in obtaining the services of qualified programmers and computer time after the information was keypunched. Although not all of the data collected was in useable form at the time this report was being prepared, the card deck is available for future use and supplements to this study are planned as time and trained personnel become available.

#### Alaska Department of Labor Information

In 1970 the Alaska Department of Labor developed a system for "profiling Alaska's rural-area manpower resources" (refer to Applicant Characteristics Bank Systems Analysis, Publication No. 1 and "Manpower Outlook" publications for rural areas and villages). The system was based upon surveys of all persons 16 years of age or older not attending school who were employed or unemployed. The attached "jobs and Job Training Questionnaire" lists the information collected. All information collected during this survey were

recorded and stored on computer punch cards for retrieval and reference purposes. The ACB system is continuously up-dated, but for this study the original survey files were used in order to arrive at characteristics for a definite time period. All individuals who indicated fishing as an "important occupation" were selected by hand from the original questionnaire files. Then the appropriate cards were selected and summary tables run by computer. Omitted from the fishermen selection were those individuals for whom fishing was in the judgement of the investigators only a "historical or incidental occupation." The following table summarizes the coverage of the sample drawn. Because of the limited coverage of both the ACB survey and the number of fishermen selected in the Central and Southeastern regions, only the Bristol Bay and Arctic-Yukon-Kuskokwim regions were analyzed in this study.

Area	ACB Survey Size	Number of Communities Surveyed	Number of Fishermen Selected for This Study	Date Surveyed

<u>Southeastern</u>	143	3	40	Winter, 1969 Spring, 1970

The Wage and Hour Division, Department of Labor, has records of wage dispute settlements between commercial fishing vessel operators and their crews. These records contain information on what expenses are incurred by the operation of a commercial fishing vessel. Although the settlement sheet information is not presented in any organized format, it was hoped they would provide insight into what wage or shares are paid crew members. The lack of comparability of data, the unrepresentativeness of the sample of operators in the files, and the difficulty of extracting and compiling data caused us to abandon this search. No information from this source has been included in the study.

### NONRESIDENT FISHERMEN INFORMATION

1. Total days boat fished both inside and outside Alaska . . . . . \_\_\_\_\_ Days
2. Total days boat fished in Alaskan waters . . . . . \_\_\_\_\_ Days
3. Percentage of time in Alaska (line 2 divided by line 1) . . . . . \_\_\_\_\_ %
4. Apply percentage on line 3 to the total expenses claimed on lines 11 through line 25 on Schedule C, page 9. Enter this amount on line 26, Schedule C, page 9. This is your allowable Alaska business deduction.

## INFORMATION SCHEDULE ON FISHERMEN

1. Taxpayer's Alaska Fisherman's License Number for 1969 . . . . .
2. Check the kind(s) of fishery resources taken. A. Salmon-Gillnet ☐ , Seine ☐ , Trolling ☐ ; B. Halibut ☐ ;  
C. Crab-King ☐ , Dungeness ☐ , Tanner ☐ ; Shrimp ☐ ; Herring ☐ ; Other ☐ (list).
3. Total fishing gross receipts from all sources both inside and outside Alaska (including Halibut). . . . . \$ ~~XXXX~~
4. Total gross receipts from the sale of all fishery products sold in Alaska and the receipts from fishery products caught in Alaska waters but sold outside of Alaska . . . . . \$ ~~XXXX~~
5. If the figures in questions 3 and 4 are different explain why on a separate sheet.
6. Total fishing expenses wherever incurred during 1969 (include Halibut). . . . . \$ \_\_\_\_\_
7. Total fishing expenses incurred during 1969 for fishery resources caught in Alaska and fishery resources caught outside Alaska which were sold in Alaska. . . . . \$ \_\_\_\_\_
8. If the figures in questions 6 and 7 differ explain why on separate sheet.
9. List the following information concerning all crew members and other persons receiving a wage or share of the fishing proceeds. Indicate with an X those individuals from which Alaska income tax was withheld. Use additional sheets if necessary.
