Uncertainty, Ambiguity and implications for Coal Seam Gas development: An experimental investigation

**Tiho Ancev,
Eloise Taylor,
Danielle Merrett**

School of
Economics

**AARES Conference
2-5 February, 2016**

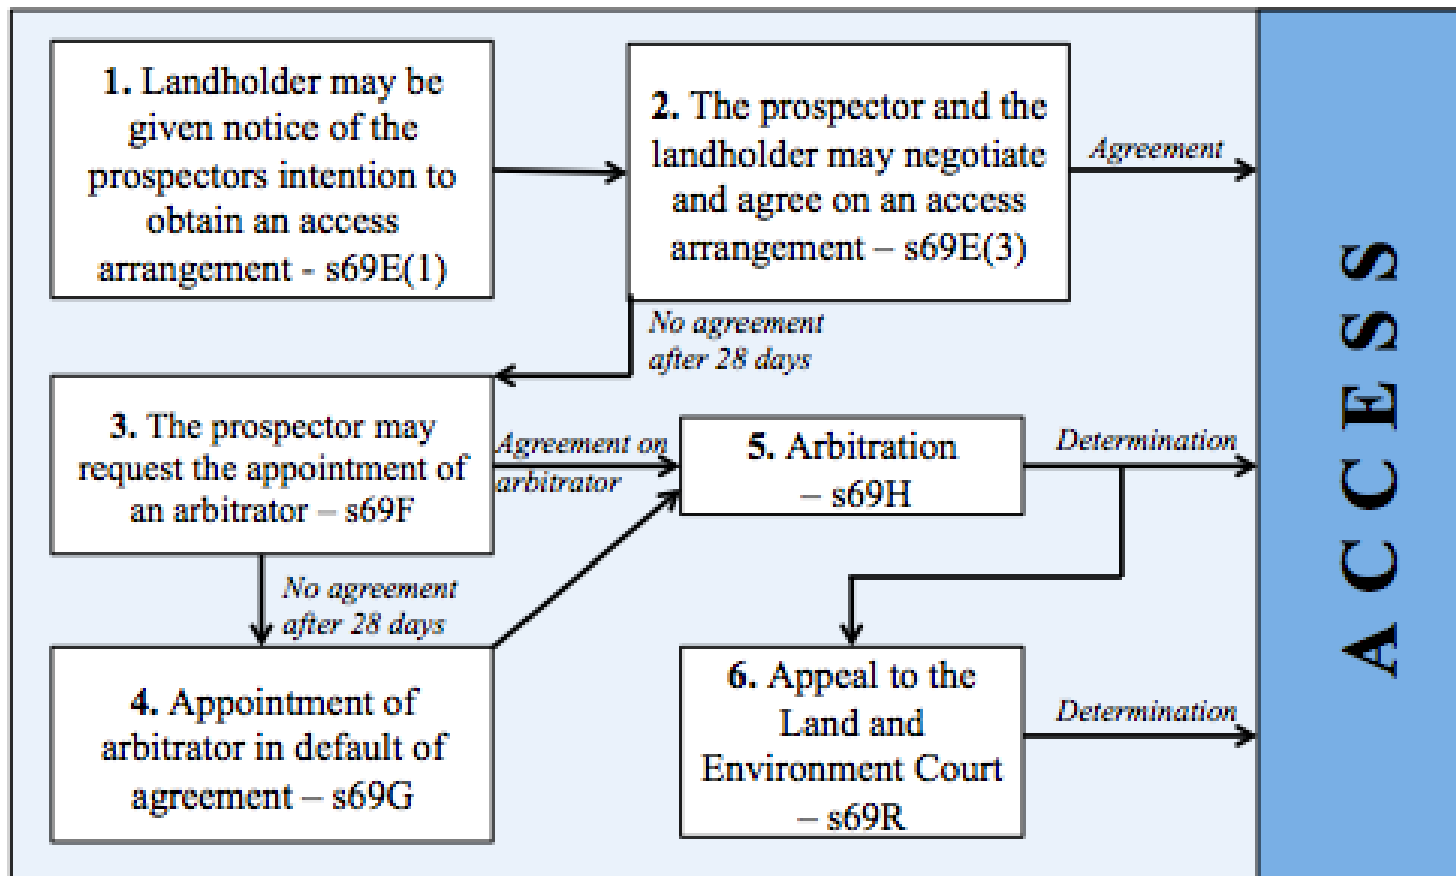

THE UNIVERSITY OF
SYDNEY

Canberra

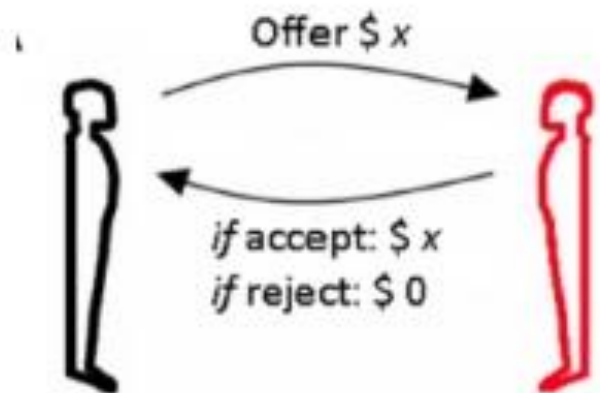

- › Social discourse around CSG has been anything but rational.
- › Current state of play, especially in Australia, is one of impasse.
- › How can society move beyond this gridlock and make some rational decisions about CSG development?
- › A research program to look into the dynamics of negotiations around CSG development.
- › First bit presented at this conference last year: increased transparency in negotiations dominated by the uncertainty.
- › This paper: understand the effects of uncertainty and ambiguity on CSG negotiations.

- › Access arrangement (AA) should be negotiated between the CSG miner and landowner.

- › Definition of the compensation test is vague:
- › Compensate “loss caused or likely to be caused”
- › Does not stipulate how the ‘likely’ is to be quantified.
- › In reality: losses to landowners are highly uncertain at best, and more likely ambiguous.
- › Definitions of ambiguity (deep uncertainty, Knightian uncertainty) vs. uncertainty:
 - deep uncertainty: probability distributions of occurrence cannot be formed *ex ante* => cannot form expected value of loss.

- › Simulate the negotiations between GSG developer and landowner by a modified ultimatum game (Hoffman et al., 1994): CSG developer is a 'proponent', and a landowner is 'respondent'.

- › Proponent makes a monetary ‘offer’ to a respondent.
- › If the ‘offer’ is accepted, the proponent can ‘develop’, which yields them a certain return.
- › If the ‘offer’ is accepted, the respondent experiences a loss, which is certain / uncertain / ambiguous (deeply uncertain).
- › If the offer is rejected, both proponent and respondent end up with their initial endowments.

- › Certainty: the respondent experiences certain loss
- › Uncertainty: the respondent experiences a loss over which they can form expectations (i.e. distribution known).
- › Expected value of loss under uncertainty is equal to the certain loss.
- › Ambiguity: the respondent experiences a loss over which they cannot form expectations (i.e. distribution unknown), but bounds are known (e.g. loss between 0 and 10)

- › Higher offers under uncertainty than under certainty
- › Higher offers under ambiguity than under uncertainty
- › Offers rejected more frequently under uncertainty than under certainty
- › Offers rejected more frequently under ambiguity than under uncertainty

- › Economic experiments in the laboratory.
- › In the present experiment: Players are matched into 10 groups (based on the randomly allocated computer terminals), each consisting of one “proponent” and one “respondent”.
- › They play 5 rounds, and are then re-matched: each ‘proponent’ plays with a different ‘respondent’ and vice-versa.

Period 1

Your offer to Player B: \$6.00
Player B's response: Accept

Your income for this period: Endowment - Offer + Value of profitable action
 $\$15.00 - \$6.00 + \$15.00$

Your income in this period: **\$24.00**

Player B's random reduction this period: \$4.00
Player B's income in this period: \$24.00

Continue

(a) Player A pay-off
(Acceptance)

Period 1

Player A's offer: \$6.00
Your decision: Accept

Your random reduction this period: \$4.00
Your income for this period: Return to asset + Offer - Random reduction
 $\$22.00 + \$6.00 - 4.00$

Your income in this period: **\$24.00**

Player A's income in this period: \$24.00

Continue

(b) Player B pay-off
(Acceptance)

Period 2

Your offer to Player B: \$4.00
Player B's response: Reject

Your income for this period: Endowment

Your income in this period: **\$15.00**

Player B's random reduction this period: None
Player B's income in this period: \$22.00

Continue

(c) Player A pay-off
(Rejection)

Period 2

Player A's offer: \$4.00
Your decision: Reject

Your random reduction this period: None
Your income for this period: Return to asset

Your income in this period: **\$22.00**

Player A's income in this period: \$15.00

Continue

(d) Player B pay-off
(Rejection)

Figure 4.1: Offer Proportion Across Treatments

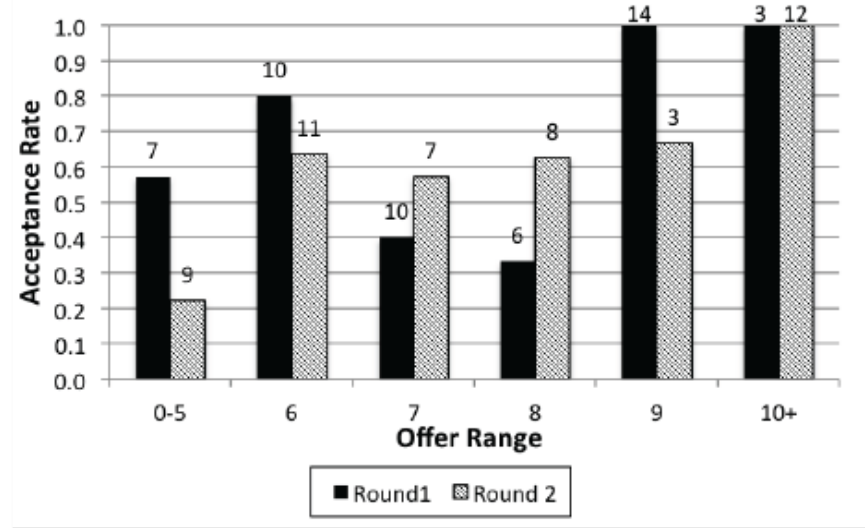

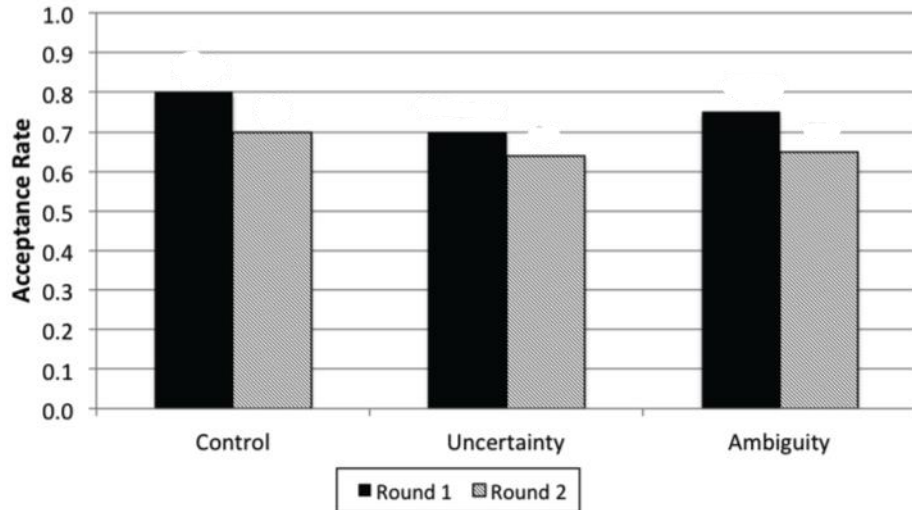

Table 4.2: Difference in Mean Offers Between Treatments

	Control	Uncertainty
Uncertainty	0.522** (0.036)	—
Ambiguity	0.533** (0.021)	0.012 (0.962)

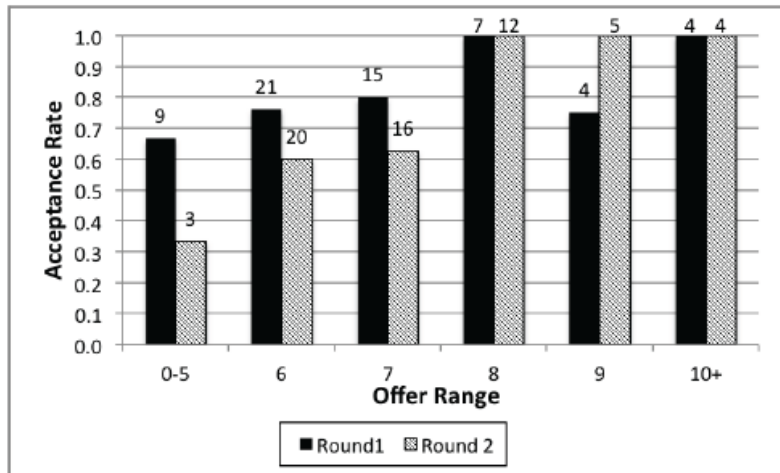

Notes: reports differences between means and p-values in parentheses. P-values obtained by two-tailed t-test for equality of means.

* $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$

Acceptance rates across rounds and by offer range

(b) Uncertainty

(a) Control

(c) Ambiguity

- › Hypotheses 1 and 3 clearly supported.
- › Hypotheses 2 and 4 are clearly not.
- › Uncertainty matters. Compensation under uncertainty should be greater compared to certainty. Reducing it will likely improve outcomes of negotiations between CSG developers and landowners.
- › Ambiguity cannot be distinguished on average from uncertainty. However, the rejection rates are higher than under uncertainty even for highest offers.
- › More precise legal definitions of the uncertain nature of the CSG problem needed.
- › Actions for resolving or mitigating uncertainty/ambiguity will be beneficial.

Thank you!
