### Food Price, Firm Productivity and Market Structure in Indonesian Food and Beverages Industry

Xi He \* University of Connecticut

Selected Poster prepared for presentation at the 2016 Agricultural & Applied Economics Association Annual Meeting, Boston, MA, July 31- Aug. 2

\*The author is Ph.D. student in the Department of Agricultural and Resource Economics at the University of Connecticut, Storrs, CT, 06269. Contact: <a href="mailto:xi.he@uconn.edu">xi.he@uconn.edu</a>

## Food Price, Firm Productivity and Market Structure in Indonesian Food and Beverages Industry

Xi He

Department of Agriculture and Resource Economics, University of Connecticut

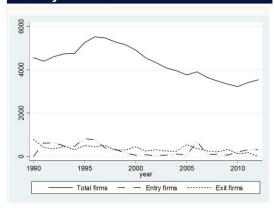

#### Background

- Food and beverages industry has always been an important sector in Indonesia and this sector contributed to as much as 7% to the GDP and 28% to total industrial manufacturing output in 2014 yet this industry is characterized by high price volatility, high concentration, and low productivity (Setiawan et al., 2012; Warr and Yusuf, 2014).
- Competing theories exist about the relationship between industrial concentration and efficiency: Quiet-life hypothesis (Hicks, 1935) suggests high industrial concentration lowers competition and therefore decreases efficiency; Efficientstructure hypothesis (Demsets, 1973) claims that firms with higher efficiency have larger market share.
- Lots of studies explore the technical efficiency in Indonesia's food and beverage sector (Margono and Sharma, 2006; Ikhsan, 2007) but the relationship between food price, efficiency and market structure is underexplored.

#### Objective

 Using firm-level data spanning from 1990 to 2012, this paper investigates the evolution of technical efficiency and market concentration of firms in food and beverages industry in Indonesia as well as the relationship between food price, firm efficiency and market structure.

#### Firm Dynamics

#### **Empirical Model**

 We use a simultaneous equation system to investigate the relationship between the three variables, which can be represented as following:

$$\begin{aligned} &Price_{jt} = \alpha_0 + \alpha_1 TFP_{j,t-1} + \alpha_2 HHI_{j,t-1} + \alpha_3 Input\_price_{j,t-1} + \epsilon_{jt} \end{aligned} \tag{1}$$
 
$$&TFP_{jt} = \beta_0 + \beta_1 HHI_{j,t-1} + \beta_2 Marketshare_{j,t-1} + \beta_3 Entry_{j,t-1} + \beta_4 Exit_{j,t+1} + \mu_{jt}(2)$$

$$HHI_{it} = \gamma_0 + \gamma_1 Price_{i,t-1} + \gamma_2 Price_{i,t-1} + \varepsilon_{jt}$$
(3)

 We follow Amiti and Konings (2007) by assuming a plant with Cobb-Douglass production function:

$$Y_{it} = A_{it}(\tau) L_{it}^{\beta_i} K_{it}^{\beta_k} \tag{4}$$

where y<sub>it</sub> is the total revenue of firm i at time t deflated by wholesale price index
of food and beverages industry. Labor,L<sub>it</sub>, and capital, K<sub>it</sub> are also adjusted by
separate deflators. Using the estimates of the production coefficients, the log of
measured TFP of plant i at time t is denoted by

$$TFP_{it} = y_{it} - \widehat{\beta}_i l_{it} - \widehat{\beta}_k k_{it}$$
 (5)

 As for the industrial concentration ratio, we use the Herfindahl-Hirshman Index (HHI)

$$HHI_i = \sum_{i=1}^{n} (MS_i)^2 * 10,000$$
 (6)

- where j = 1,2,...,n denotes the subsector, i = 1,2,...,n indexes firms within a subsector, MS<sub>i</sub> denotes the market share of firm i in its respective subsector.
- We use three-stage least square method to estimate the simultaneous equation system. The method can increase inefficiency and help to get unbiased and more efficient estimators.

#### **Data and Measurement**

- We operationalize the empirical model using firm-level data from Indonesia between 1990 and 2012 collected annually by the central Bureau of Statistics, Budan Pusat Statistik (BPS).
- The Annual Manufacturing Surveys cover the population of manufacturing firms in Indonesia with at least 20 employees and include firm-level information like revenue, value-added, number of employment, capital, machinery, and fixed assets etc.. The sample covers the period from 1990 to 2012 during which the data are tractable and comparable.
- We use the food and beverages sector at the 2-digit level of International Standard Industrial Classification (ISIC) system.
- We use the World Input-Output Database (WIOD) developed by Timmer et al. (2015) as our major source of construction of price index.
- As for the model adopted to estimate the technical efficiency of firms, output is
  defined by total output divided by wholesale-price Index (WPI) of food and
  beverages. Labor efficiency units are used as a proxy for labor use. We define
  fixed capital as fixed assets, deflated by the WPI of machinery (excluding
  electrical products), transport equipment, residential, and non-residential
  buildings.

#### Conclusion

- Food and beverages industry is a relatively mature industry, and higher concentration benefits consumers in the sense that it decreases the product price.
- Foreign firms benefits from high concentration in that concentration leads to higher TFP, yet high concentration is harmful for domestic firms in the sense that high concentration results in lower TFP of domestic firms.
- Divergent effects of concentration on foreign and domestic firms necessitate careful FDI policies as well as manufacturing policies.
