## ACKNOWLEDGMENTS

Several people and organizations were helpful in providing data and information used in this study. Our appreciation and thanks are extended particularly to the economic development specialists who assisted us in identifying exported services firms to include in the study.

Thanks are given to Norma Ackerson for document preparation and to our colleagues for reviewing this manuscript.

Financial support was provided by the United States Department of Agriculture as part of the Regional Center for Rural Development in North Dakota and the North Dakota Agricultural Experiment Station.

The authors assume responsibility for any errors of omission, logic, or otherwise.

We would be happy to provide a single copy of this publication free of charge. You can address your inquiry to: Carol Jensen, Department of Agribusiness and Applied Economics, North Dakota State University, PO Box 5636, Fargo, ND 58105-5636, (Ph. 701-231-7441, Fax 701-231-7400), (e-mail: [cjensen@ndsuent.nodak.edu](mailto:cjensen@ndsuent.nodak.edu)) or electronically from our web site: <http://agecon.lib.umn.edu>

## **ABSTRACT**

The North Dakota Input-Output model has been used extensively to analyze changes in the state's economy. Within the past decade, exported services (e.g., telemarketing, data processing, reservation and financial centers) have become an important component of the North Dakota economic base. The purpose of this report is to estimate the contribution of exported services firms to the economic base (sales for final demand) of North Dakota and of regions and counties within the state, for 1998 and 1999. Exported services sales for final demand in 1999 totaled \$348 million statewide, or almost 3 percent of the state's economic base. Regions 5, 2, and 7 had the largest contributions from exported services activities, which amounted to 6 percent of total sales for final demand in Region 5, 4 percent in Region 2, and 2 percent in Region 7.

**Key Words:** exported services, economic development, input-output model

## HIGHLIGHTS

The North Dakota Input-Output model has been used extensively to analyze changes in the state's economy. Within the past decade, exported services (e.g., telemarketing, data processing, reservation and financial centers) have become an important component of the North Dakota economic base. The purpose of this report is to estimate the contribution of exported services firms to the economic base (sales for final demand) of North Dakota and of regions and counties within the state, for 1998 and 1999.

A list of exported services firms was developed for each county and planning region in North Dakota, based on information obtained from regional council personnel, community economic development coordinators, and other knowledgeable officials, as well as previous research conducted by the authors. Individual firms were contacted to obtain information concerning the nature of each firm's operations, year it began operation, and current number of employees. This information was originally compiled for 1998 and subsequently updated for 1999. The number of employees was the base upon which sales for final demand were estimated. Occupational wage rates obtained from Job Service North Dakota were used to estimate payrolls of the exported services firms. Payrolls were then used to estimate the firms' total contribution to sales for final demand, based on relationships drawn from a previous survey of firms in this sector.

Exported services were found to contribute substantially to North Dakota's economic base, with the largest contributions occurring in Regions 5 (Fargo), 2 (Minot), and 7 (Bismarck-Mandan). Exported services sales for final demand in 1999 totaled \$348 million statewide, or almost 3 percent of the state's economic base. The contributions from exported services activities amounted to 6 percent of total sales for final demand in Region 5, 4 percent in Region 2, and 2 percent in Region 7.

# **Adding An Exported Services Component to the North Dakota Input-Output Model's Business and Personal Services Sector**

Randal C. Coon and F. Larry Leistritz\*

Development of North Dakota's Input-Output model was first undertaken in the early 1960s. The model was initially developed to analyze the economic impacts of irrigation associated with the Garrison Diversion Project. This input-output model consisted of 13 basic economic sectors. Increasing importance of energy development in the mid 1970s resulted in four energy-related sectors being added to the model. For a complete discussion of the early development of the North Dakota Input-Output model, see Coon et al. (1985).

The input-output model includes the sectors that describe the North Dakota economy. Some of the model's sectors are basic economic sectors, those industries that earn income from outside the area. Income earned by these sectors is often referred to as the economic base, or sales for final demand. What makes up the state's economic base components has also changed with shifts and diversification of North Dakota's economy. Since the original model was developed, economic base components have been added for coal mining, electric generation, petroleum exploration/extraction, and petroleum refining. More recently, revenue from oil lease-bonus payments, Conservation Reserve Program payments, and coal conversion activities were added to the basic economic sectors. In the last decade, the state's economy has diversified with the addition of numerous exported services firms (Leistritz 1993). Exported services firms include telemarketing, reservation and financial centers, data processing, computer services, and information related businesses. They are essentially service sector firms that primarily provide services to customers (markets) outside North Dakota. It is necessary to estimate the level of income these types of businesses add to the state's economic base so that the input-output model can accurately replicate the North Dakota economy (Leistritz, 1999).

## **PROCEDURES**

A list of exported service firms was assembled from a combination of sources. An initial list was compiled from previous research project (see Leistritz and Coon 1997 and Coon and Leistritz 1997). Regional councils, city economic development coordinators, internet web pages, and knowledgeable officials were contacted to expand, correct, and update the basic list developed in 1997. Some of the individual businesses were contacted to obtain the data necessary to complete the list. Information collected included the business name, the year the firm started operations, and the number of employees. Table 1 contains the list of businesses involved in exported services in North Dakota.

The exportable services component of business and personal services sales for final demand was estimated for 1998 and 1999, with 1999 being the last year data were available for the other basic sectors of the North Dakota Input-Output model. The number of employees was the base upon which sales for final demand were estimated. Employment was aggregated to the state region level. Occupational wages for different areas of the state were available for detailed job categories (Job Service North Dakota 1999, Job Service North Dakota 2000). These data were available for the 1996-1997 and 1996-1998 periods. Hourly wages were available for an extensive listing of occupations for different areas of the state. Mean hourly wage for 6 representative occupation categories (clerks-receptionists and information, computer support, data keyers, travel agents, clerks-insurance claims, and telemarketers) were averaged for the selected areas of the state. Because the average wages were for the 1996-1997 and 1996-1998 periods, the Consumer Price Index was used to update them to 1998 and 1999 levels. Hourly wages were converted to annual salary by using a 2,080 hours per work year (Table 2).

Converting exported service payroll to economic base activity was accomplished using previously developed relationships (Coon and Leistritz 1997). Wages and salaries constituted 59.2 percent of the level of business activity for exported services firms. Applying this relationship to salaries produces the exported services component of sales for final demand (Table 3). The final demand vector component generated in Table 3 was added to the Business and Personal Services sector to obtain an enhanced final demand vector for that sector. Results of updating the business and personal services sector final demand vector are presented in Table 4.

Table 3. Employment, Average Salary, Exported Services Payroll, and Exported Services Final Demand Vector Component, by State Region, 1998 and 1999.

## RESULTS

The addition of exported services to the business and personal services sector helps capture a new component of the North Dakota economy. It would be difficult to estimate the component for years prior to 1998, and because of the recent emergence of this industry, it may not be necessary. Exported services contribute very significantly in State Regions 2, 5, and 7 with additions of \$53.5, \$133.7, and \$58.4 million in 1998 and \$80.1, \$146.8, and \$59.2 million in 1999, respectively. State Region 5 with the Fargo metropolitan area has captured the largest share of the state export services component in 1998 (45.7 percent) and 1999 (42.1 percent). State Region 2 had the second largest export services component in both 1998 and 1999; this region includes the Minot trade center. At the state level, exported services amounted to \$292.7 million, or 38 percent of the \$769.2 million total sales for final demand of the business and personal services sector (the remainder representing sales to tourists) in 1998. In 1999 the exported services component had grown to \$348.4 million, nearly 35 percent of the \$1,003.4 million North Dakota sales to final demand total.

Sector by sector sales for final demand for 1958-1999 period are presented in Appendix Tables 1-9, for the regions and the state. Resulting gross business volumes generated from the

sales for final demand are presented in Appendix Tables 10-18. County-level exported services components of the business and personal services sector are presented in Appendix Table 19 for 1998 and Table 20 for 1999.

## CONCLUSIONS

Updating the sectors and economic base of the North Dakota Input-Output model is necessary to reflect changes in the North Dakota economy. This model has wide application and is a major component of several comprehensive economic simulation models. Development of a data base and methodology to include the exported services addition to the state's economy has greatly enhanced the model. This addition to the model has updated it with respect to the newly emerging industries in the state. As North Dakota's economy continues to diversify, this type of

model enhancement may be necessary again. The ability to quickly alter the input-output model to reflect a changing economy again highlights the value of this tool for economic analysis.
