## CORRELATIONS AMONG GRAIN CHARACTERISTICS USED TO DETERMINE THE EFFECTS OF MILLED RICE STORAGE TIME AND TEMPERATURE ON AROMATIC RICE QUALITY <sup>1</sup>

Rodney B. Holcomb, M. Edward Rister, Lori A. Faltisek, Bill Webb, Rhonda K. Miller, Karen Bett, and H.L. Goodwin, Jr.<sup>2</sup>

### DEPARTMENT OF AGRICULTURAL ECONOMICS TEXAS AGRICULTURAL EXPERIMENT STATION TEXAS A&M UNIVERSITY SYSTEM

Research conducted and reported herein funded by Texas Higher Education Coordinating Board Advanced Technology Program (project # 999902-25, 1992-1993); Texas Agricultural Experiment Station (projects H3807 and H3914); the United States Department of Agriculture-Agricultural Research Service, Southern Region; and Rhone-Poulenc, Inc.

The authors are, respectively: Assistant Professor, Department of Agricultural Economics, Oklahoma State University; Professor, Department of Agricultural Economics, Texas A&M University; Student Technician, Department of Agricultural Economics, Texas A&M University; Retired Head of USDA Rice Quality Lab, Beaumont, TX; Associate Professor, Department of Animal Science, Texas A&M University; Food Technologist, USDA Southern Regional Research Center; and Associate Professor, Department of Agricultural Economics and Agricultural Business, University of Arkansas.

#### **Abstract**

Summary statistics and corresponding Spearman correlation coefficients are illustrated for various subsets of aromatic milled rice storage time and temperature data from (a) the College Station texture sensory panel, (b) the New Orleans aroma and flavor sensory panel, and (c) the Beaumont USDA-ARS Rice Quality Laboratory. These correlations represent the inclinations of seemingly-related measures of several attributes to "move together," acting as an indicator of their associations with or impacts on one another.

#### **Acknowledgments**

The TATRP aromatic rice research project was a large undertaking with a host of collaborators. Among the major collaborators not included among the co-authors of this report are Janice Delgado, John Dornak, Dwight Kanter, John Kendall, David Kohlwey, Lori A. Koop, Steve Linscombe, Anna McClung, Biki Mohindra, Karen Moldenhaur, J.W. Stansel, Allen W. Sturdivant, and their respective staffs. In addition, the efforts of the following individuals are noteworthy: Hank Beachell, Clarence Beverly, Glenn Bowers, Lejo Brana, R.E. Branson, Keith Cadwallader, Bob Cogburn, Hal Coss, Fred Dahm, Frank Flachman, Robert Freeman, Jerry Freyermeuth, Charles Gates, Naomi Gibson, Joe Hafner, Mickey Haramoto, Bud Hunnel, Farman Jodari, Ted Klimski, Karen Kunz, Ted LaBree, Robert Laborde, J.V. Maca, John Mann, Gene Markwood, Garry McCauley, John P. Nichols, Maurice Pulliam, Steve Rocca, John Scott, Jim Stewart, Troy Thompson, Richard Vincent, Jim Bob Ward, and Shari Williamson.

# **Correlation Measures for Milled Rice Storage Time and Temperature Component of Aromatic Rice Project**

#### Introduction

This paper is a companion document to the paper, "Effects of Milled Rice Storage Time and Temperature on Aromatic Rice Grain Quality Characteristics" (Holcomb et al.). The sole intent of this document is to further enhance the description of data used in the Holcomb et al. paper. Simple summary statistics and corresponding Spearman correlation coefficients (Bhattacharyya and Johnson, pp. 402, 528) are illustrated for various subsets of the data used in the noted Holcomb et al. paper. Whereas the previous Holcomb et al. paper reported results separately for (a) the College Station texture sensory panel, (b) the New Orleans aroma and flavor sensory panel, and (c) the Beaumont USDA-ARS Rice Quality Laboratory, this document provides insights on the correlations among seemingly-related measures across the three data sources. The subsets included are not exhaustive, but rather a simple attempt to enhance the information available to those interested. Readers unfamiliar with the terms used in describing the various data are referred to Goodwin et al.

Analysis of the textureometer data referred to in this paper were not included in the aforementioned Holcomb et al. paper. A forthcoming paper presents textureometer analyses similar to those reported in the Holcomb et al. paper for both (a) the rough rice storage and temperature and (b) the milled rice storage, temperature, and packaging data sets.

Table 1. Rice Textural Characteristics (and Raw Rice Color) Evaluated by the College Station Rice Texture/Color Descriptive Attribute Panel. a, b

Characteristic	Description	SAS Analysis Correlation Variable <sup>c</sup>	Abbreviated Variable Name
Adhesiveness	How sample holds together when first placed in the mouth.	MTE_AD	AD
Cohesiveness	Degree to which sample deforms rather than crumbles or breaks.	MTE_CO	СО
Hardness	Force required to bite through cooked rice with the molar teeth.	MTE_HA	НА
Toothpacking	Degree to which rice sticks on/in the surfaces of the teeth.	MTE_TO	ТО
Starchy Coating	Amount of paste-like thickness perceived on the rice.	MTE_SC	SC
Surface Slickness	Maximum ease of passing the tongue over the rice surface.	MTE_SS	SS
Chewiness	Length of time needed to masticate rice for swallowing.	MTE_CH	СН
Uniformity of Bite	Degree to which rice changes from start to finish.	MTE_UB	UB
Cohesiveness of Mass	Maximum degree to which mass holds together during mastication.	MTE_CM	CM
Roughness	Amount and irregularity of the grains' surfaces, combined.	MTE_RO	RO
Residuals	Amount of particles remaining in the mouth after swallowing.	MTE_RE	RE
Raw Rice Color	Level of whiteness discernable by simply viewing the raw rice.	MTE_RR	RR

<sup>&</sup>lt;sup>a</sup> Source of first two columns is Holcomb *et al.*, Table 1, p. 43.

Textural characteristics and scales are in accordance with the rice attribute lexicon developed at Kansas State University (Goodwin *et al.*).

<sup>&</sup>lt;sup>c</sup> Variable names are those used in the statistical analyses reported in Holcomb *et al.* 

Table 2. Rice Aromas and Flavors Evaluated by the New Orleans Rice Aroma/Flavor Descriptive Attribute Panel. a, b

Characteristic	Description	SAS Analysis Correlation Variable <sup>c</sup>
Characteristic	Description	variable <sup>3</sup>
Sewer/Animal Aroma	Immediate and distinct pungent aroma; sulfur-like or "piggy."	SWA
Floral Aroma	Similar to dried lilac and/or lavender; spicy floral.	FLA
Grain Aroma	Similar to corn, oats, wheat, or their combination.	GRA
Hay-Like Aroma	Dry, dusty; like freshly cut and dried grass.	HYA
Popcorn Aroma	The distinctive aroma of freshly popped popcorn.	PCA
Corn Aroma	Combined aromatics of corn kernels, milk, and germ.	CRA
Alfalfa Aroma	Dried, slightly earthy, slightly sweet; like dried alfalfa leaves and stems.	ALA
Dairy Aroma	Reminiscent of pasteurized cow's milk.	DRA
Sweet Aroma	Impression of sweetness given by the combined aromatics.	STA
Sewer/Animal Flavor	Sulfur-like (rotten eggs) or generic animal flavor.	SAN
Floral Flavor	Spicy flavor reminiscent of an old-fashioned sachet.	FLR
Popcorn Flavor	Slightly toasted and slightly sweet flavor of popcorn.	PCN
Grain Flavor	Reminiscent of a combination of grain flours and meals.	GRN
Dairy Flavor	Similar to pasteurized cow's milk.	DRY
Sweet Flavor	Impression of added sugar/sweetener.	SWT
Water-Like Flavor	Mouth feel of minerals and metallic components commonly associated with tap water.	WTL

<sup>&</sup>lt;sup>a</sup> Source of first two columns is Holcomb *et al.*, Table 2, p. 44.

Aromas, flavors, and scales are in accordance with the rice attribute lexicon developed at Kansas State University (Goodwin *et al.*).

<sup>&</sup>lt;sup>c</sup> Variable names are those used in the statistical analyses reported in Holcomb *et al*.

Variable names are those used in the statistical analyses reported in Holcomb *et al*.

Table 4. Textureometer Characteristics Evaluated at Time of College Station Rice Texture/Color Descriptive Attribute Panel Appraisals.

Characteristic	Description	SAS Analysis Correlation Variable
Adhesiveness	The force required to remove cooked rice that adheres to serving utensils and the mouth (especially the teeth) during eating.	MAD
Chewiness	Relating to the length of time required to masticate cooked rice at a constant rate of force application, to reduce it to a consistency suitable for swallowing.	МСН
Cohesiveness	The internal force holding a grain together before it breaks, when compressed between the teeth.	MCO
Gumminess	Denseness that persists throughout mastication; the energy required to disintegrate cooked rice to a state ready for swallowing. This term is a composite of hardness and cohesiveness.	MGU
Hardness	The force required to compress cooked rice between the molar teeth on the first chew.	МНА
Springiness	The degree to which cooked rice returns to its original shape once it has been compressed between the teeth.	MSP
Resistance	Initial resistance of the cooked rice grains to compression; also referred to as "initial modulus."	MMD
