Hans J. Teuteberg<sup>1</sup>

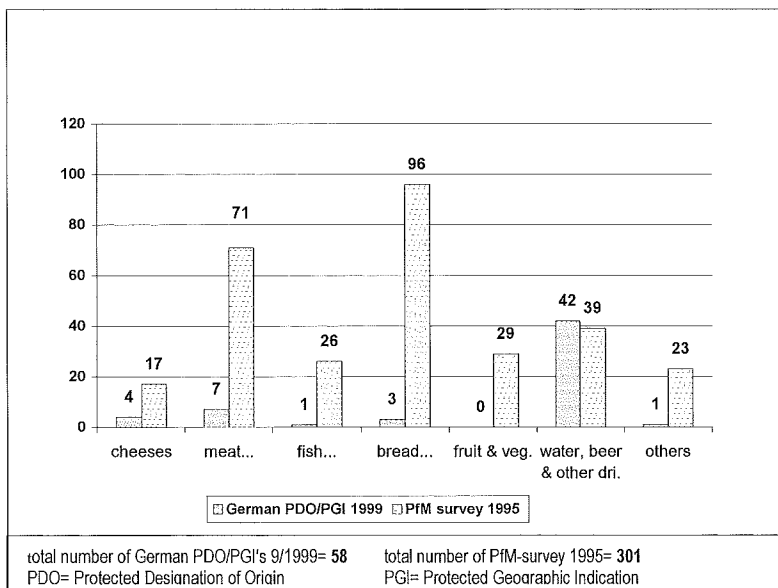

## ARE THERE GERMAN SPECIALITY-FOODS ?

In the recent years, the development of culinary culture in Europe has become a sociologic topic. Kutsch debunks the German *kraut* image as a negative national stereotype : neither has sauerkraut been invented in Germany, nor is the consumption per capita much higher than in France.<sup>2</sup> Mennell ascertains that "Germany, like England, failed to develop any separate *haute cuisine* of

its own". He traces this back to the "francophilia" of aristocratic courts in Germany.<sup>3</sup> Barlösius additionally bases it on the late formation of the German nation and the smaller political influence of the German citizenship compared to the French neighbours<sup>4</sup>.

This might beg the question : "Are there German specialities ?" and shows at the same time the little culinary self-confidence in Germany<sup>5</sup>.

**Figure 1 : Number of German PDO / PGI and traditional products**

However, already Mennell assumes the presence of regional specialities : "The political fragmentation [...] with its proliferation of small noble courts, was probably favourable to the strong persistence of regional specialities to the present day"<sup>6</sup>. An investigation for *Euroterroirs*<sup>7</sup> at the Professur für Marktlehre in 1995 showed that Germany has a cornucopia of traditional regional agricultural products and foodstuffs<sup>8</sup>. Although the research design was slightly different to the approach of the EEC-regulation No 2081/92, around 300 products were described and the Professur für Marktlehre even expects the identification of a lot more products.

Almost 1/3 of the investigated products is bread, pastry, confectionery and other bakers' wares. Meat and meat-based products make up around 1/4 of the survey.

This could represent good conditions for the EEC-council Regulation No 2081/92 in Germany.

### THE IMPLEMENTATION OF THE EEC-COUNCIL REGULATION NO 2081/92 IN GERMANY

Before the commencement of the EEC-council Regulation N° 2081/92, the misuse of geographic denomination was prosecuted by the rightful producers or by consumer associations. The usurpers had to be sued individually. A national decree system for geographic denominations did not exist in Germany<sup>9</sup>. For example in the early Sixties, 90% of *Lübecker Marzipan* was produced outside the city of Lübeck. The authentic *Lübecker Marzipan* has a high portion of almonds. The usurpers outside of Lübeck used fewer almonds but more sugar and still branded their products with the geographic indication. The rightful producers became aware of the danger for their reputation and the risk for the indication to become a generic term. They successfully defeated the infraction in several lawsuits<sup>10</sup>.

If we compare the nature of geographic denominations with the three states of matter : "gaseous", "liquid", "solid" ; German denominations before the EEC-council Regulation No 2081/92 could be "gaseous" (generic term), "liquid" (defended by several lawsuits) or somewhere in between<sup>11</sup>. The European legislation introduced the new physical state : "solid".

This solid – eternal – protection for geographic denominations is very attractive, but the new protection system was radically different to the existing system.<sup>12</sup> The relation to the German trademark legislation was not at

all clear and the need for an objective relationship between the product and its geographic origin did not fit into the concept of simple and qualified geographic denominations.

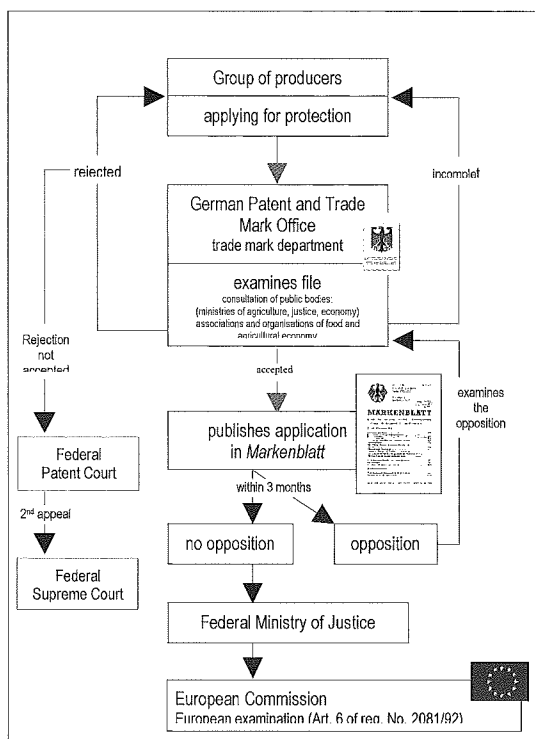

A vivid discussion in the specific German law journals accompanied the formation and the commencement of the EEC-council Regulation 2081/92.<sup>13</sup> The applying groups made neither head nor tails of the new system<sup>14</sup>.

Finally over 900 of all 1400 European applications within the process of short application (Article 17) were German. Their fear to loose any protection was stronger than the ignorance of the system. Most of them were incomplete or taken back by the applying firm itself<sup>15</sup>.

Today less than 12% of the accepted European PDO/PGI products have German indications. Half of them are mineral waters – each in the hand of one firm each.

The economic significance of the German registered products is negligible.
