Introduction

- Popularity of high resolution satellite image data
 - Many names: remote sensing data, GIS data, raster data, ...
 - Abundant publicly and freely accessible data sources
 - Numerous applications in interdisciplinary works
- Agro-climatic relation: one of the most common topic
 - $Y = f(H, P, S, X)$
 - Ag production, food security, climate change, etc
 - Increasing studies in precision ag and big data analysis
- Two frequent approaches in agro-climatic relation
 - Process-based models (e.g., Rosenzweig et al., 2014)
 - Statistical models (e.g., Schlenker and Roberts, 2009)
 - High demand on imagery data in both approaches

Agro-Climatic Analysis and Data Works

- Wolfram Schlenker says:

“A funny thing about that paper (PNAS 2009 with Michael Roberts): Many reference it, and often claim that they are using techniques that follow that paper. But in the end, as far as I can tell, very few seem to actually have read through the finer details of that paper or try to implement the techniques in other settings. Granted, people have done similar things that seem inspired by that paper, but not quite the same. Either our explication was too ambiguous or people don't have the patience to fully carry out the technique, so they take shortcuts.” (G-FEED, 1/10/2015)

- Data management is a big step

- Limited knowledge on data itself and management skill sets
- Often enormous computational time and effort

- Agro-climatic Data by County (ACDC)

- Goal: provide the most widely-used variables from the most popular high resolution gridded data sources to endusers of agro-climatic variables

ACDC v. 1.0.0

- Available at: <http://dx.doi.org/10.4231/R72F7KK2>
- Data, county map, and user manual are available!

Agro-Climatic Data by County, 1981-2015

By Seong Do Yun¹, Benjamin M Gramig²

1. Mississippi State University 2. University of Illinois at Urbana-Champaign

Agro-Climatic Data by County (ACDC) is a county level dataset that combines annual corn/soybean/cotton/wheat yield with gridded growing degree days, precipitation, and soil characteristics data from public data provided by USDA-NASS, USDA-NRCS,...

Description

Agro-Climatic Data by County (ACDC) is designed to provide a county level base dataset for use in agricultural production and climate/weather research. Due to the recent popularity of raster imagery data (high resolution grid cell data), the demand for weather, soil/land and related data for research and applied decision support is increasing rapidly. The ACDC data set was developed to provide the most widely-used variables extracted from the most popular high resolution gridded data sources to end users of agro-climatic variables who may not be equipped to process large geospatial datasets from multiple publicly available sources that are provided in different data formats and spatial scales. Annual county level data for 1981-2015 are provided for corn, soybeans, upland cotton and winter wheat yields, and customizable growing degree days and cumulative precipitation for two groups of months (March-August and April-October) to capture different growing season periods for the crops. Soil characteristic data are also included for each county in the data set. All weather and soil data have been processed based on land cover/land use data and exclude soil and weather data for land that is not being used for non-forestry agricultural uses.

Data Structure

- County level, 1981 ~ 2015

Crop Yields

- Yields (bu/ac) of the four major US field crops from NASS

Heat Exposure Length (GDDs)

- Sine Method

Heat Exposure Length (GDDs)

- -60°C ~ +60°C by 1°C intervals using PRISM

March - August, 1981-2015

April - October, 1981-2015

Total Precipitations

- Aggregation of daily precipitation (PRISM)

MAR-AUG

APR-OCT

Soil Variables

- Ten major soil variables from gSSURGO
- 1992, 2001, 2006, and 2011

Water Holding Capacity (cm/cm)

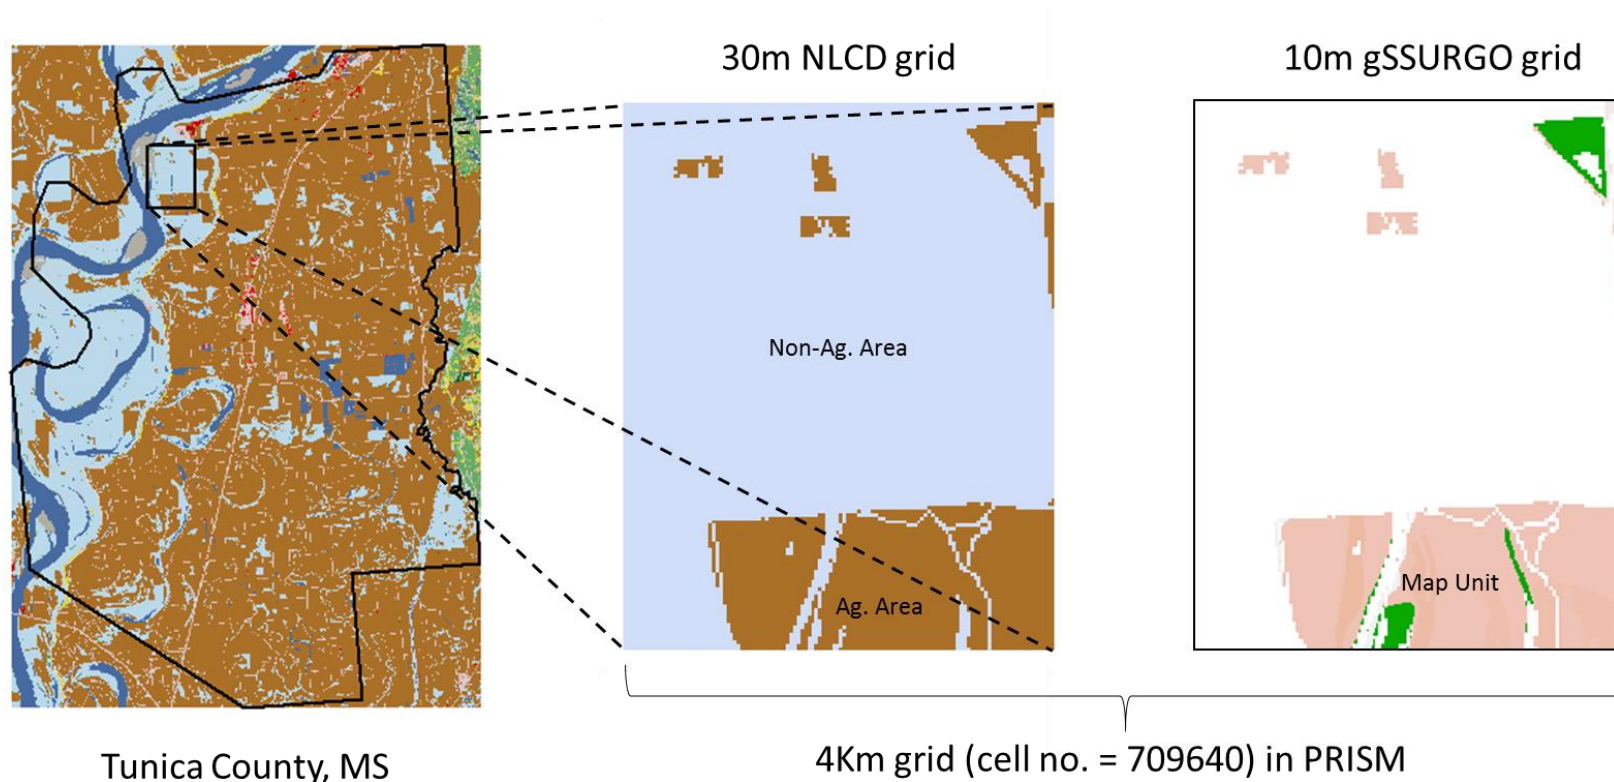

Soil pH

Water holding capacity and Soil pH from year 2011

Agricultural Masks

- Agricultural area mask from NLCD

- Weather data: ag-area weighted average in a county
- Soil data: ag-area only average in a county

Aggregation or Disaggregation of ACDC

■ Aggregation of ACDC

- For example, county to state
- Aggregation is a **smoothing** in geocomputation
- Minimum level: county due to the yield data

■ Disaggregation of ACDC

- For example, county to zipcode
- Require assumption to assign values to a finer level
- A better way

Aggregate up the original data to the target-area level

➤ Not recommended to aggregate up or disaggregate down!

Concluding Remarks

- Agro-Climatic Data by County (ACDC) v. 1.0.0.
 - We are preparing a paper submission to the Environmental Modelling & Systems
 - Depending on the availability of newer data, ACDC will be updated on the repository
- Empirical applications of ACDC
 - Spatial econometrics (Yun et al., 2015 AAEA)
 - Ex-post crop yield response (Yun and Gramig, 2017 AAEA)
- Inquires on ACDC?
 - Data repository: <http://dx.doi.org/10.4231/R72F7KK2>
 - Contact: Seong Yun (seong.yun@misstate.edu)
