More Emotional Better Predictable

Samir Huseynov, Marco Palma

Texas A&M University

January 18, 2018

Outline

- 1 Motivation
- 2 Modeling
- 3 Results
- 4 Conclusion

Why Economist should get Emotional?

- Walmart is incorporating facial expression devices that can measure post-purchase customer satisfaction.
- Disney is experimenting with various biometric tools, including eye-tracking and facial expression analysis.
- Is it finally the time of Edgeworth's "Hedonimeter"?

What we find?

- 1 Surprise and sadness are effective in purchase decisions when neutral emotion is primed, but anger and disgust mostly explain purchase decisions after emotion is primed.
- 2 Anger (drowsiness) is important to predict non-purchase (purchase) decisions after emotion is primed.
- 3 Increased intensity of emotion helps to increase the prediction accuracy by 3% under low and 9% under high emotional feelings compared to the regular emotion condition.

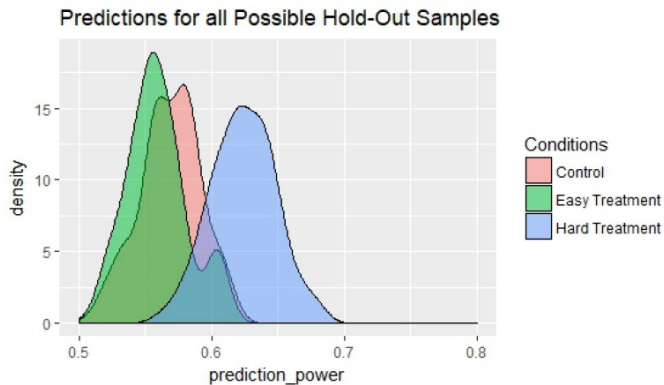

Growing A Tree And Eventually The Froest

Regression trees have been developed to bridge linear models with non-parametric estimations. While growing a tree, at each node \sqrt{p} number of input variables are randomly drawn with replacement. A point, along with the range of each randomly drawn variable, is chosen to do a split to minimize the Residual Sum of Squares (RSS) of the outcome variable.

Classification with a tree

Distribution of Prediction Results

Conclusion

Modern Hedonimeter can increase the prediction power of economic models and thus exhibits the importance of emotional feelings in economic choice.

The End!
