# Modeling and Forecasting Agricultural Commodity Support in the Developing Countries

---

ISAAC MILLER, JULIAN BINFIELD, JING ZHAO, WYATT THOMPSON

IATRC, DECEMBER 3-5, 2018

# The project

---

We want to investigate how agricultural support has evolved in different countries

- In particular the link between income and support

This has varied between countries. In general:

- Agriculture tended to be taxed in less developed or developing countries
- Developed countries were more likely to subsidize their agriculture

Using market support data from those countries for 1961–2011 from the World Bank Agricultural Distortion database, estimate econometric models

Aim is to then use projections of macroeconomic and other variables to generate estimates of future agricultural commodity support measures

# Building on past work

---

Anderson and Nelgen (2012) examine the factors driving nominal rates of assistance (NRAs) of six key crop products, including rice, wheat, maize, soybean, sugar and cotton,

- find that supported level tended to grow as a country's per capita income rose

Zhao, Miller and Thompson have a recent publication paper named “Modeling and Extrapolating Wheat producer Support Using Income and other Factors”, Journal of Agricultural Economics, October 2017

In this project we will extend our research to an assessment of more commodities

Also have a broader look at the relationship between incomes, NRAs and other measures of support

# Primary research goals

---

Analyze how agricultural support programs evolved in the past, particularly in key developing countries

Identify the major factors that influence agricultural support over time using econometric methods

Forecast agricultural commodity support in the developing countries for the medium-term future

Put these results in perspective through some comparisons to developed countries' support and to WTO commitments

# Countries and Commodities

---

Countries: China, India, Brazil, Russia (emerging countries)

- Includes agricultural commodity importers and exporters
- Include a range of policy environments
- Include differing macroeconomic environments

Commodities: Wheat, Cotton, Maize, Sugar

- Widely produced
- Contains food crop, feed crop
- Different markets and policy environments

# Agricultural policy for protection

## *Direct interventions*

- Tariffs
- Import and export quotas
- Export subsidies
- Sanitary and phytosanitary restrictions

## *Indirect interventions*

- Exchange rate management
- Marketing supports
- Input subsidies and tax exemptions
- Long-term investment assistance

# China and U.S. Corn Prices, 2001-2014

Note: China prices converted to U.S. dollars at the official exchange rate.

Source: China National Development and Reform Commission, China National Grain and Oils Information Center, and U.S. Department of Agriculture.

# Agricultural Distortions database

---World Bank

---

**Time period:** 1955-2011

**Countries :** 75

**Commodities :** almost all major

**Major indicators:** NRA, Nominal Rate of Assistance, by product

**Definition of NRA:** farmers' gross return with/without policy

$$NRA = \frac{\text{Gross return with government policy} - \text{gross return without government policy}}{\text{gross return without government policy}}$$

NRA=NRA\_O(output) +NRA\_I(input), NRA\_O=NRA\_B+NRA\_D

NPS, non-product specific support

# Major factors

Variable Name	Definition
NRA (NRA_B, NRA_D, NRA_I)	Indicators of aggregate market distortion
INC	Real GDP per capita
APR	Agricultural population rate
PAL	Per capita agricultural land
D <sub>1</sub> , D <sub>2</sub> , D <sub>3</sub>	Dummy for food crisis or slump(73-74, 86-88,06-08)
DUMMY (TM,TH)	Dummy for trade status
S	Dummy for WTO membership

# Econometric model

---

$$y_{it} = \alpha + \rho y_{i,t-1} + x_{it}'\beta + d_i'\delta + \varepsilon_{it}$$

$y_{it}$  stands for NRA or one of its components,

$$x_{it} = (Inc_{i,t-1}, Inc_{i,t-1}^2, Inc_{i,t-1}^3, APR_{it}, PAL_{it}, D_{1it}, D_{2it}, D_{3it}, TM_{it}, TH_{it}, S_{it})',$$

$d_i$  represent a vector of  $N-1$  binary country indicators,

$\varepsilon_{it}$  is an idiosyncratic error term.

*Estimation method: OLS Fixed effect model---best linear predictors*

# Preliminary results

---

Estimation results for different commodities

Forecasting of support levels in different countries

# Estimation Results

	Wheat		Maize		Sugar		Cotton

# Linking NRA, projections of NRA with WTO notifications

---

No direct link between NRAs and WTO notifications, are different things

- One calculated in a systematic way from actual market data etc
- One generated according to rules but often deviating from actual support
- WTO notifications can stay the same when markets change, or countries can change the way that they notify the same policies

Purpose of project not to forecast notifications

Just want to investigate the relationship between NRAs and WTO notifications

Can then link income to notifications and look at impact of changing incomes on notifications

# WTO notifications, Brazil

Large exporter of many products

Previously had negative NRA\_B

Over time NRA\_B has tended towards zero

Model wants NRA\_B to become positive, NRA\_D to stay low

Ag support has risen, but not part of AMS

Using Article 6.2 exemption and green box

# WTO notifications, Russia

Joined WTO in 2012

Mixture of policies:

- Crops exports often taxed
- Border protection for livestock products

Dataset ends pre-WTO, has negative NRA\_B for wheat and maize

Our projections have NRA\_Bs going positive

# WTO notifications, India

Self sufficiency also an important driver of policy

- Significant border controls, some non-tariff

- Significant state involvement in markets

Volatile NRA\_Bs

Projections positive for cotton and sugar, slightly negative for wheat and maize

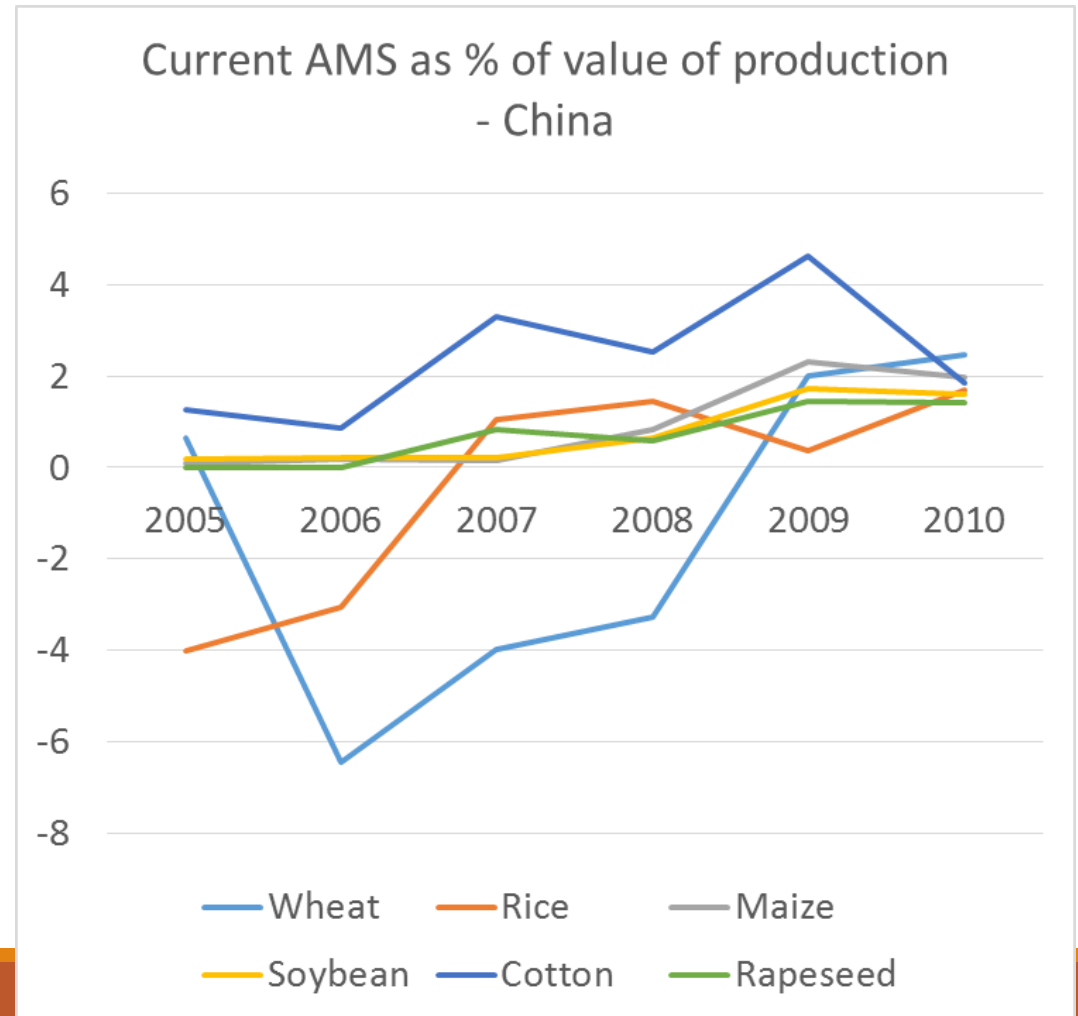

# WTO notifications, China

China support for grains rising

Model only based on data to 2011 so missing relevant data

Trade off between border policies and domestic policies, with both potentially constrained by WTO

# Progress report

---

We want to investigate the link between incomes and agricultural support

Use econometric model to link World Bank Agricultural Distortion database to income for select countries and commodities

The results vary by commodity, and result in different projected paths for agricultural support

We can use this to think about how agricultural support will evolve

What does this imply about WTO notifications?

# Thanks!

---

Many thanks to the IATRC for commissioning this research.
