International Rice Outlook

International Rice Baseline Projections, 2017-2027

Eric J. Wailes, Eddie C. Chavez, and Alvaro Durand-Morat

Keywords: International rice, baseline, policy, deterministic, stochastic, Arkansas Global Rice Model

JEL Codes: C02, F01, F14, F17, Q17, Q18, R11

Abstract

This outlook contains updated baseline rice projections for U.S. and international rice economies as of January 2018. The purpose of this document is to present the current state and the expected directions of the rice economies in the world by assessing their potential supply and demand paths over the next decade. This set of projections serves as a baseline for evaluating and comparing alternative macroeconomic, policy, weather, and technological scenarios. The estimates are intended for use by government agencies and officials, farmers, consumers, agribusinesses and other stakeholders who conduct medium- and long-term planning.

The baseline projections are generated by the Arkansas Global Rice Economics Program (AGREP); and are grounded in a series of assumptions about the general economy, agricultural policies, weather, and technological change. It is assumed that current agricultural policies will be continued in the United States and other countries included in this study. Projections in this outlook are based on the information available as of January 2018. In light of the volatility of the global rice economy, a stochastic analysis is included in this report to provide a better understanding of the probable distribution of future outcomes. The stochastic estimates establish the likely upper and lower bounds for selected variables, which serve as indications of inherent risks associated with the global rice economy.

The authors acknowledge and appreciate the collaboration with the team at FAPRI-MU based at the University of Missouri in Columbia; but take full responsibility for any remaining errors in this document.

Introduction

This updated outlook is not a set of predictions but rather a framework to present a baseline of the likely direction of key variables in the global rice economy and the degree of variability of some of the key variables. Deterministic and stochastic baseline estimates presented in this report are generated using the Arkansas Global Rice Model (AGRM). AGRM is a statistical simulation and econometric framework developed and maintained by the Arkansas Global Rice Economics Program (AGREP) with the Department of Agricultural Economics and Agribusiness at the University of Arkansas in Fayetteville. It covers 66 rice-producing/exporting and rice-consuming/importing countries/regions.

The AGRM researchers have benefited from working closely with colleagues at the Food and Agricultural Policy Research Institute (FAPRI) based at the University of Missouri, Columbia which maintains U.S. agricultural and other commodity models. They provide projections on variable costs of production for U.S. rice, and prices and net returns for other U.S. crops, which are iteratively-exchanged with the AGRM international rice prices and country models until an equilibrium market conditions are obtained.

In particular, prices and net returns for corn, soybeans, and wheat are relevant considering that these commodities are substitute crops for rice in the U.S. and other countries. For example, rice area competes with a number of crops including soybeans, corn, and cotton in rice-producing states in the U.S. (Arkansas, Louisiana, Missouri, Mississippi, Texas, and California). In the People's Republic of China (PRC), rice competes with corn in the provinces of Guangxi, Heilongjiang, Jilin, and Liaoning; with wheat in the province of Jiangsu; and with both corn and wheat in the provinces of Anhui, Chongqing, Guizhou, Hubei, Ningxia, Sichuan, and Yunnan. In India, rice competes with wheat particularly in the northern states (Carriquiry et al., 2012; Wailes and Chavez, 2013).

The historical rice data is obtained from the Production, Supply, and Distribution (PS&D) online database (USDA-FAS, 2018) and Rice Outlook (USDA-ERS, 2018) as of January 2018. The AGRM rice marketing years by country generally follow the USDA system. For example, *the year 2017 or marketing year 2017/18* in the model refers to January 2018–December 2018 for Thailand, Vietnam, and Indonesia; October 2017-September 2018 for India; July 2017-June 2018 for the Philippines; August 2017-July 2018 for the U.S.; and April 2018-March 2019 for South American countries. See the link <http://apps.fas.usda.gov/psdonline/psdAvailability.aspx> for details. The annual compound growth rates as well as the total growth numbers presented in this document are estimated using the three-year average from 2015 through 17 as the base year; and cover the next 10-year period ending in 2027.

The global model is disaggregated into 66 of the major rice producing, consuming and trading rice countries/regions; and the rest-of-the-world is grouped into five regional aggregations: Africa, the Americas, Asia, Europe, and Oceania. With rice as an ascendant food staple in Sub-Saharan Africa, we provide projections of selected West African countries and for the Economic Community of West African States (ECOWAS). Each country or regional model includes a supply sector (harvested area and yields), a demand sector (per capita use), with trade, stocks, and price linkage equations. Net global rice trade for long grain and medium grain solves for the two respective world reference prices, long grain and medium grain.

The deterministic baseline assumes the following: a continuation of existing policies; IHS Global Insight projections for macroeconomic variables; no new WTO Doha Round trade reforms; and average weather conditions. Growth rates in rice yields in selected countries consider the potential positive impacts from the Global Rice Science Partnership (GRiSP) R&D funding on global rice productivity.

The stochastic baseline provides a range of probable outcomes (confidence intervals), as opposed to the deterministic analysis, which generates only average point estimates. Stochastic estimates are useful given the fact that the underlying assumptions in the deterministic baseline usually do not hold true in reality, i.e., actual market outcomes deviate from average estimates. Stochastic analysis provides information on risk and uncertainty that is an important characteristic of the international rice economy.

The stochastic framework is generated using multivariate empirical distributions (MVE) of the yield variable for each of the 66 countries and regions in the model, as well as for each of the six rice-producing states in the United States. We use yield as the stochastic variable because it varies by year and by country, and it is very sensitive to changes in weather conditions and water availability—factors that are critical for rice production. The MVE takes into account serial and geographical covariance. A total of 300 random draws are implemented using a 33-year empirical distribution of historical yields from 1984 through 2016, generated using the software Simulation & Econometrics to Analyze Risk (Simetar) developed by Richardson et al.(2008).

Rice Policy Overview

The global rice economy is one of the most policy distorted commodity markets (Wailes, 2005) The AGRM projections reflect policy interventions through the trade, stocks, supply and demand equation in the model. There is significant border protection through tariffs and tariff rate quotas in many importing countries. The primary rationale is to indirectly support domestic producers, usually with a goal of becoming more self-sufficient in rice, a basic food staple in many countries. Rice exporters have increasingly turned to rice price and input subsidies to help rice producers become competitive in world markets and to support farmers' incomes that have declined relative to urban incomes. The primary data sources for rice policies in the model include 1) the World Trade Organization Tariff Analysis Online (TAO) and the tariff download facility; Food and Agriculture Organization (FAO), United Nations, Rice Market Monitor; the Agricultural Market Information System (AMIS) policy database, and the Food Policy and Market Development in Global Information and Early Warning System (GIEWS); and Foreign Agricultural Service (FAS)/US Department of Agriculture, Global Agricultural Information Network (GAIN) Reports.

Rice sector policy assumptions by country are documented in Appendix Table 1.

Macro Data for Major Exporting Countries

Basic macro data for real gross domestic production growth (RGDP), exchange rates relative to the US dollar (USD), and population growth are depicted in Figures 1-3 for major exporting countries that include Thailand, India, Vietnam, Pakistan, Myanmar, and Cambodia.;

For the major exporters', annual GDP generally grows from 5-8% over the baseline period, except for Thailand that has relatively low growth of 2-4% (Figure 1). The global rice market is denominated in US dollars hence exchange rate relative to USD is relevant in rice trade. Figure 2 shows nominal foreign exchange rate indices in terms of US\$ per local currency using 2010 as the base year. Currencies of Thailand and India remain on par relative to the US dollar over the baseline period, whereas those of Vietnam, Pakistan, Myanmar, and Cambodia depreciate relative to USD. This implies that export competitiveness of these four countries will be expected to improve over the baseline.

The population of each of the same set of major exporters is growing but at a declining rate (Figure 3). Growth in Thailand is expected to approach zero percent by 2028.

Figure 1 Annual growth of Gross Domestic Product (GDP) of major rice exporting countries, percent, 2010-2028.

Figure 2 Nominal foreign exchange rate index (2010=100) of major rice exporting countries, US dollar/local currency, 2010-2028.

Figure 3 Annual growth of population of major rice exporting countries, percent, 2010-2028.

Macro Data for Major Importing Countries

Macro data for major importing countries including Nigeria, PRC, China, Indonesia, the Philippines, Iran, Iraq and Saudi Arabia are presented in Figures 4-6.

Figure 4 presents the annual GDP growth rates of the major importing countries, which generally range from 4-7% over the baseline period, except for Iran, Saudi Arabia and Nigeria, which have lower projected growth rates.

Figure 5 shows that China's currency depreciates initially then appreciates thereafter. The currencies of Indonesia, the Philippines, Saudi Arabia, and Iraq are stable. Iran and Nigeria have depreciating local currencies over the baseline, which will make their imports more expensive.

The populations of all the major rice importing countries are generally growing, but at a declining rate with those of Saudi Arabia and Iran at a relatively faster decline (Figure 6).

Figure 4 Annual growth of Gross Domestic Product (GDP) of major rice importing countries, percent, 2010-2027.

Figure 5 Nominal foreign exchange rate index (2010=100) of major rice importing countries, US dollar/local currency, 2010-2027.

Figure 6 Annual growth of population of major rice importing countries, percent, 2010-2027.

Key Market Drivers

Recent Developments and Baseline Overview

International rice prices strengthened in the first half of 2017, reaching a peak in July 2017. The price drive was primarily due to the increasing import demand from Bangladesh and Sri Lanka. Prices eased significantly in August-October, but have strengthened again since then due to the continuation of imports by Bangladesh and Sri Lanka, and the increased demand from Indonesia. Prices for Thai and Vietnamese long grain rice 5% broken remain above \$410 per metric ton (mt) (FAO Rice Price Update, March 2018).

The global rice market absorbed the impacts of Thailand's controversial and costly Shinawatra paddy pledging program (PPP), a politically-motivated price-floor support policy for Thai farmers (Wailes and Chavez, 2013). The PPP was reformulated by the military government and under the current government replaced with subsidized credit and inputs to farmers (USA Rice Federation, 2014); and a limited pledging program for fragrant and glutinous rice was implemented (USDA-FAS, 2014). The Thai rice industry has now become more market-oriented and its rice price competitive with other major global suppliers, particularly Vietnam.

Over the next decade, growth in global domestic use is projected to exceed domestic supply, increasing total rice trade and steadily increasing nominal long grain international prices. Major rice-deficit countries continue to import as domestic production falls short of domestic demand despite subsidies and intentions to achieve self-sufficiency.

The average world reference long grain rice price (Thai 100% B) is projected to increase by 2.2% annually, as total global net trade grows at 1.9% over the same period. Major rice-deficit countries continue to import as domestic production falls short of domestic demand. The nominal average world long grain rice reference price increases from \$400 per mt (2015-2017 average) to \$489 per mt in 2027. However, in real terms (using the base 2015-2017=100) the world long grain rice reference price remains relatively stable, ranging from \$359 to \$379 per metric ton (Table 1 and Figure 7).

The world reference medium grain rice price is projected to remain high and relatively steady, ranging between \$735 (2015-2017 average) and \$763 per mt, as demand for medium grain trade remains stable and relatively limited relative to the expected growth in long grain rice trade (Figure 8).

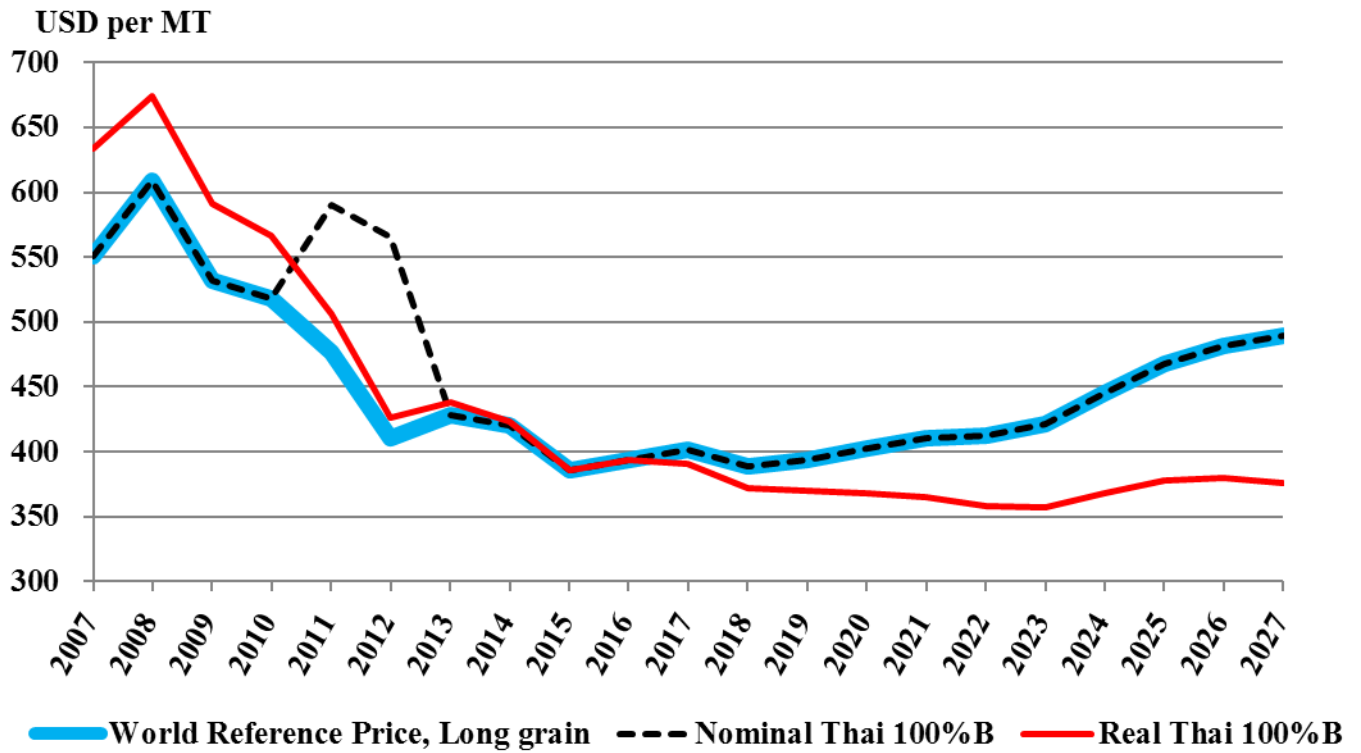

Figure 7 Historical and projected long grain world reference rice price, US dollar per metric ton, 2007-2027.

Margins between U.S. and Asian Rice Prices

The Western Hemisphere prices, represented by the U.S. prices, remain substantially higher than Asian rice prices---with average margins to Asian prices expanding to as high as \$183 per mt in 2017. The Asian and U.S. long grain margins are expected to narrow steadily over the baseline, reaching \$99 in 2022 and \$58 by 2027, as competition between Asian and Western Hemisphere rice is expected to grow in markets such as Iraq, Nigeria, and Latin America (Table 1 and Figure 8).

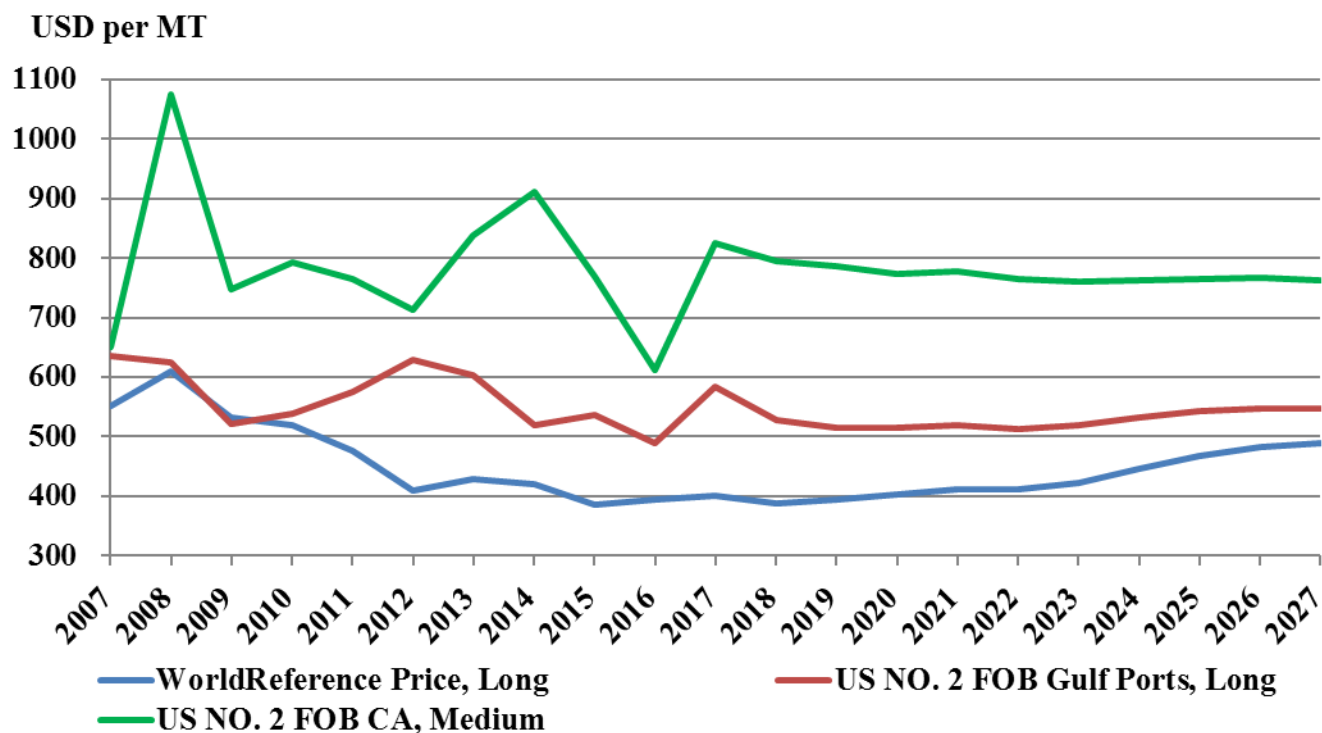

Figure 8 U.S. long grain and medium grain rice export prices (FOB) relative to world long grain reference price, US dollar per metric ton, 2007-2027.

Growing Segmentation in Rice Markets

Segmentation in trade flows and prices of long and medium grain markets is a long-standing characteristic of the global rice economy. Our baseline projections reflect that this segmentation is expected to continue, and even within each type (medium grain from Mid-South versus Calrose; long grain from Uruguay and the U.S. versus Vietnam). This is indicated by the price relationships between the medium grain California rice price long grain prices. The lack of substitution between medium grain rice and long grain provides support for a sustained large margin.

Overview of Global Rice Supply and Demand

Rice is the most important food crop of the developing world and the staple food of more than half of the world's population, accounting at a global level for approximately 20% of daily caloric consumption (IRRI, 2013). Unlike the baseline prices projected in Figure 8, world rice prices tend to be highly volatile from year-to-year and even within years, due to a number of reasons. Rice has price inelastic supply and demand throughout much of Asia, where it is the dominant food staple. As a result, quantity shocks from either supply or demand of rice result in disproportionate price responses. Furthermore, while rice is the primary staple for half the world's population, it is thinly-traded, which means that there is limited trade flow to address quantitative shocks particularly in rice importing countries, forcing the adjustment burden on price. While the percent of rice traded as a percent of global production is increasing, only about 9.1% of rice production is traded as opposed to 13.9% for coarse grains and 22.5% for wheat (WASDE, 2018).

International rice export supply will remain highly concentrated over the next decade, with the projected five dominant players (India, Thailand, Vietnam, Pakistan, and Myanmar) accounting for over 80% of global net trade (Table 1). India is projected to expand exports over the baseline, replacing Thailand as

the leading exporter. Furthermore, Myanmar is expected to replace the U.S. as the fifth largest global rice exporter owing to Myanmar’s anticipated strong expansion in production over the next decade.

Figures 9 and 10 show the historical and projected paths of world rice supply and Use. Over the projection period, India and the People’s Republic of China (PRC) will continue to account for the bulk of the global rice economy. On average, the two countries combined are projected to account for nearly 36% of the world population from 2017-2027. Over the same period, they will have an average combined share of close to 45% of world rice area harvested, 51% of total milled rice production, 49% of total rice consumption, and 79% of world rice stocks.

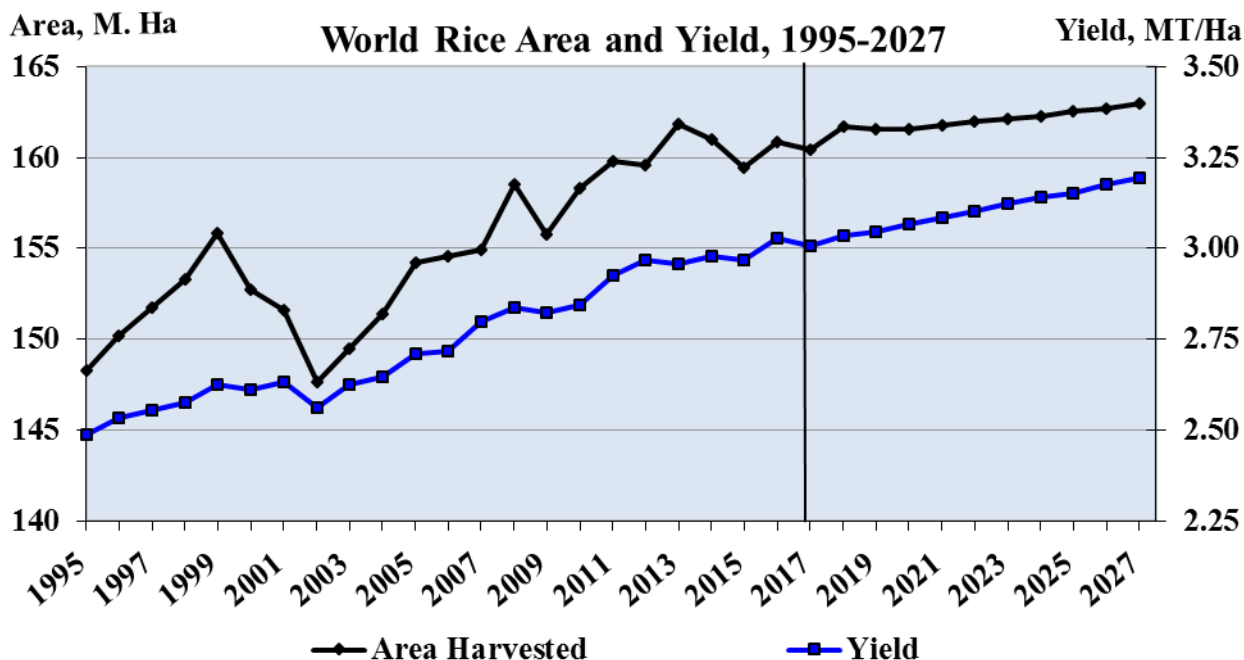

Figure 9 World rice harvested area and yield, historical and projected, 1995-2027.

Detailed Results of the Deterministic Baseline Analysis

- Projections generated from the deterministic analysis by country and by region for the period 2017-2027 are presented in Tables 1 through 98. To serve as convenient reference, a list of the tables with description is included below:
- Table 1: Summary of the projected *net trade* by country and international rice prices, Thai 100%B Long Grain, U.S. No. 2 Gulf Ports FOB, Long Grain export price, and the U.S. No. 2 California FOB Medium Grain export price which serves as the international reference price for medium grain).
- Table 2: Summary of the projected global rice supply and demand and stocks to use percent.
- Tables 3-57: Individual country supply and demand projections (production, consumption, stocks, and net trade).
- Tables 58-75: World regional (Africa, Asia, Western Hemisphere, Europe, and Oceania) total rice supply and demand projections with a sub-regional aggregate for countries of each region that are modeled individually in AGRM, and another sub-regional aggregate for the remaining countries of each region that are modeled as a group in AGRM.
- Tables 76-78: Projected rice supply and demand projections for ECOWAS, presented separately to highlight the increasing importance of the region to the global rice economy.
- Table 79: Projected rice milled yield per hectare by country.

- Table 80: Projected per capita rice Use by country.
- Table 81: Projected world and country rice *total trade* (as opposed to World rice *net trade* shown in Table 1).
- Table 82: Projected world and countrylong grain rice trade,
- Table 83: Projected world and country rice medium grain trade,
- Table 84: Projected world rice and FAPRI wheat, corn, and soybean prices and price relationships.
- Tables 85-87: Projected U.S. detailed total, long grain, and medium grain rice supply and Use (in English units),
- Tables 88-93: Projected rice area, yield, and production by individual U.S.State,
- Tables 94-98: Basic supply and demand projections (production, consumption, stocks, and net trade) for five newly-added African countries (Madagascar, Malawi, Zambia, Rwanda, and Uganda).

Global Rice Trade

Net global rice trade expands 1.9% per year over the 2017-2027 period, reaching 46.6 mmt in 2027 well above the three-year (2015-2017) average of 38.6 mmt (Table 1). On the exporters' side, the significant investment in production and processing capacity in the Mekong Delta in Vietnam, Cambodia and Myanmar bodes well for increasing their role as important rice suppliers over the next decade. As low-cost producers, these countries are poised geographically to supply the relatively steady Chinese rice import market. The productivity gains from hybrids and the research generated by the Global Rice Science Partnership (GRiSP) are expected to have positive supply impacts on Asian and African rice economies over the same period.

Cambodia's exports are projected to grow at 4.9% per year, reaching 2.0 mmt in 2027 up from 1.2 mmt (2015-2017 average) as moe area under production and higher yields increases production above consumption growth. Myanmar's exports are projected to expand from 2.4 mmt (2015-2017 average) to 3.7 mmt in 2027, supported by yield-based growth in production.

For the U.S., total rice exports increase by 240 thousand mt or 6.0 million hundredweight (mil. cwt) over the next decade, reaching 3.7 mmt (or 115 mil. cwt) in 2027. Total imports are stable around 24 mil. cwt. The U.S. has relied increasingly on trade agreements to lock in preferences for its rice exports. However, the Trump administration has sought to renegotiate (NAFTA) or scuttle other negotiations (Trans-Pacific Partnership). Whether the U.S. rice sector can rely on these favorable trade agreements into the future has become uncertain. (See Table 85 for U.S. rice supply and use summary in English units).

Main Sources of Growth in Global Rice Trade

Exports

Table 1 shows the major global rice suppliers over the next decade with corresponding annual growth rates. While the largest growth by total volume over the same period will come from India (1.9 mmt) and

Vietnam (1.5 mmt), the fastest rate of annual growth is exhibited by Cambodia (4.9%) and Myanmar (4.5%).

One way to gauge the ability of a rice-exporting country to expand exports into the future is to examine the extent by which its per capita production exceeds per capita consumption (i.e., its surplus) as indicated in Table 2, which compares the total change from the past decade (2007-17) and the projected period (2017-2027). It is interesting to note that the relatively smaller countries of Myanmar and Cambodia are shown to have the highest per capita surplus values at nearly 100% and 40%, respectively--indicating their ability to compete for export markets as rice suppliers over the baseline period.

Table 1. Major global rice exporters, volume in million metric tons and annual percent growth, 2015-2017 average vs. 2027

Country	2015-17 Average	2027	Change	Annual % Change
Thousand Metric Tons				
India	10,996	12,902	+1,907	+1.6
Thailand	10,445	11,522	+1,077	+1.0
Vietnam	5,990	7,514	+1,524	+2.3
Pakistan	3,847	3,565	-281	-0.8
United States	3,426	3,884	+458	+0.7
Myanmar	2,378	3,686	+1,308	+4.5
Cambodia	1,249	2,017	+768	+4.9

Table 2 Major rice exporters: average per capita surplus in kilograms, 2007-2017 vs. 2017-2027.

Country	2007-17 Average	2017-27 Average	Change	% Change
Kilograms				
India	6.9	8.1	+1.2	+17.1

Thailand	136.9	150.3	+13.1	+9.7
Vietnam	65.7	66.2	+0.5	+0.7
Pakistan	20.3	16.2	-4.0	-19.9
United States	8.2	8.1	-0.1	-1.2
Myanmar	28.6	56.6	+27.9	+97.6
Cambodia	64.6	90.4	+25.8	+39.9

Imports

Rice imports have steadily concentrated over the last several years. For instance, the share of the five largest rice importers increased from 17% in 2006/07 to 27% in 2016/17. However, this trend is projected to ease during the next decade. While China remains an important major rice importer over the baseline period, but because it continues to hold large rice stocks, its imports show only very modest growth from its Tariff Rate Quota (TRQ) level.

Nearly 75% of the growth in global imports over the same period will come from Africa, with the 15-member ECOWAS (including Nigeria) accounting for 44% of the growth in global imports. In general, expansion in imports is associated with a combination of relatively high population growth and lagging production growth relative to expansion of consumption. Supported by increasing population and growing income, the Middle East is another region with strong growth in rice imports.

Table 3 shows the major global rice importing countries/regions and the total increases in imports over the baseline as well as the annual growth rates. The largest change by total volume as well as the fastest rate of growth comes from Nigeria, the other ECOWAS countries, and the Middle East region. Table 4 shows the extent by which per capita production lags per capita consumption (i.e., deficit), showing PRC and ECOWAS (separated into ECOWAS-14 and Nigeria) as having the biggest per capita increases in deficits from the past decade (2007-17) to the projected baseline period (2017-2027). The per capita deficits for South Africa, Indonesia, and the Philippines are projected to decline owing to the downtrend in rice per capita use.

Table 3 Major global rice exporters, volume in million metric tons and annual percent growth, 2015-2017 average vs. 2027.

Country	2015-17 Average	2027	Change	Annual % Change
Thousand Metric Tons				
ECOWAS-14	5,963	8,124	+2,161	+3.1

PR China	5,114	5,337	+223	+0.4
Middle East	3,784	5,471	+1,687	+3.8

Philippines	19.5	11.7	-7.8	-39.7
South Africa	28.3	26.5	-1.8	-6.5
Indonesia	4.8	2.7	-2.1	-43.3

Rice Harvested Area and Production

Global rice output continues to expand over the next decade, driven by the use of higher-yielding varieties and hybrids and other improved production technologies—in line with self-sufficiency programs of major rice consuming countries. China and India will continue to account for more than half of total world production with the rest accounted for by Indonesia, Bangladesh, Vietnam, Thailand, Myanmar, the Philippines and Rest of the World (ROW) (Figure 11). Global output increases by nearly 40 million metric tons (mmt) over the same period, equivalent to an annual growth of 0.8%; and reaching 520.5 mmt in 2027 with 0.6% of gain coming from yield improvement and the rest from increases in area harvested (Table 2).

By volume, about 34% of the expected growth in global rice output over the next ten years will come from India; 45% from seven countries including Bangladesh, Thailand, Vietnam, Myanmar, the

Philippines, Indonesia, and Cambodia; and 21% from the ECOWAS-15. However, rice output in PRC declines by a total of 6.3 mmt, and those of Japan and South Korea decline by 1.0 mmt combined, over the same period. Total U.S. rice production, on the other hand, is projected to increase by a total of nearly 963 thousand mt (or 31 mil. cwt) over the same period, equivalent to 1.4% annual growth, which comes mainly from yield improvement (Table 3).

Figure 11 Top world rice-producing countries, historical and projected, million metric tons, 2007-2027.

Rice Domestic Consumption

Over the next decade, expansion of world rice demand will be driven mainly by population growth in conjunction with other factors such as income level and demographics. In some Asian countries where rice is an inferior good and a food staple, rising incomes continue to dampen per capita rice demand. These countries include Japan, Taiwan, PRC, and South Korea. Demographic trends also weaken rice demand, as aging populations and a growing focus on health and diversification of diets shift preferences away from rice and towards more fruits, vegetables, and protein-based diets.

Over the baseline, global rice consumption is projected to increase by 47.6 mmt reaching 521.8 mmt in 2027, equivalent to an annual growth of just under 1.0%. Global population growth of 1.1% per year is projected to be offset partly by a 0.14% decline in average world rice consumption per capita (Table 2). Nearly half (49.2%) of the total volume of global consumption is accounted for by China and India; while 27% is accounted for by the six countries that include Indonesia, Bangladesh, Vietnam, the Philippines, Thailand, and Myanmar (Figure 12). About 24% of the growth in global rice consumption comes from India; 54% from five additional countries including Bangladesh, PR China, Nigeria, the Philippines, and Indonesia; 17% from ECOWAS; and the rest from ROW. The U.S. total rice

consumption increases by 470 thousand mt (or 15.0 mil. cwt) over the same period, reaching 4.3 mmt (136.1 million cwt) in 2027 or an annual growth of 1.2%; of which 0.9% comes from population growth and 0.3% from higher per capita use.

Figure 12 Top world rice-consuming countries, historical and projected, million metric tons, 2007-2027

Rice Global Stocks

The top rice stockholding countries in the world from 2007 through 2027 are presented in Figure 13, with China accounting for 68% of global stocks on average. Global rice stocks-to-use ratio is projected to decline slightly over the same period, from about 0.23 in 2017 to 0.20 in 2027--reflecting the relatively faster growth in total consumption than that of the total global output. One of the important uncertainties of this baseline is what China will do over the projection period with its large quantity of rice stocks. Production subsidies have contributed to excessive production. Should China begin to liquidate its surplus stocks, there will be significant downward pressure on international long grain prices and production.

Figure 13 Top-ranking countries in rice ending stocks, historical and projected, million metric tons, 2007-2027.

Rice Supply and Demand by World Region

The summary results for the five world regions are presented in Tables 62-76. Three tables are associated with each region: the first one is the total for the region; the second is the sum of individually-AGRM modeled countries in the region; and the third consists of the remaining countries in the region that are modeled in AGRM as a group. Thus, the sum of the five world regions represents the entire world rice economy.

A more detailed look at the regional projections is useful as it provides a better understanding of the geographical dynamics and the relative importance of each region to the global rice economy.

Africa

Table 62 shows that Africa’s total rice output is projected to grow by 3.4% per year, driven by both growth in area (1.6%) and yields (1.8%). This expected productivity improvement is supported by availability of increased research funding from public and private organizations, more focused efforts by the Africa Rice Center and the International Rice Research Institute (IRRI), and a possible expanded distribution and adoption of improved rice varieties like the New Rice for Africa (NERICA) cultivars. The region’s total rice consumption grows by 3.4% per year as population grows by 2.6% and per capita use rises by 0.7% annually. This increased consumption is supported by 1.1% annual growth in real per capita income².

² Real per capita income is computed by dividing total real gross domestic product by population.

Table 63 presents the results for the group of individually-modeled African countries in AGRM. This group is expected to increase total rice production by 3.4% per year, as both area and yields expand by 1.7%. Total consumption of this group gains 3.4% annually, driven by 2.6% growth in population, 0.7% growth in per capita use, and 1.0% growth in real per capita income.

Table 64 shows that the “Other Africa” region (or the rest of African countries that are modeled as a group) expands its rice output by 2.5% per year, with 0.7% resulting from growth in area harvested and 1.8% from yield increases. Total consumption of this group expands at 2.9% per year, supported by 2.7% population growth and 0.2% gain in per capita use. Real per capita income grows by 1.3% annually.

Americas

Total rice production of the Western Hemisphere (Table 65) grows at 1.5% per year, which comes from a 0.7% and 0.8% average annual growth in yield and area, respectively. Total consumption increases at 1.1% annually, a combined effect of 0.9% population growth and 0.1% gain in per capita use with 1.4% growth in real per capita income.

The group of individually-modeled Western Hemisphere countries (Table 66) is projected to grow total rice output slightly by 1.7% per year, as area gains 1.1% and yields grow by 0.6%. Total rice consumption of this group gains 1.1% annually, as population grows by 0.9% and per capita use by 0.2%. Real per capita income grows at 1.4% per year.

Total rice production of the “Other Western Hemisphere” region modeled as a group (Table 67) contracts by 1.8% per year, as both area and yield declines by 1.6% and 0.2%, respectively. Total consumption of this group grows at 0.5% per year, which comes solely from the 1.2% population growth as per capita use declines by 0.7%. Real per capita income grows by 1.9% annually.

Asia

Total rice production of Asia (Table 68) increases by 0.6% per year, solely accounted for yield as area remains flat. The total Asian rice consumption grows by 0.7% per year as the population growth of 0.9% is offset by a decline in per capita use. Rice is an inferior good in most Asian countries and the relatively strong projected growth of 3.6% in real per capita income has dampening effect on rice consumption.

Similarly, the group of individually-modeled Asian countries (Table 69) is projected to grow total rice production by 0.6% annually solely coming from increase in yield. Total rice consumption of this group grows by 0.7% annually, all contributed by population growth as per capita use declines slightly and real per capita income expands at 3.7% annually.

The net growth of total rice output of the “Other Asia” region modeled as a group (Table 70) is 2.2% annually, with area growing by 1.4% and yield gaining 0.8% per year. Total consumption of this group grows at 1.6% per year, of which 1.5% comes from population growth and the rest from per capita use. Real per capita income grows at 2.3% per year which is relatively slower than that of the group of modeled Asian countries.

Europe

The total rice production of Europe (Table 71) grows at 0.9% per year, which is mainly accounted for by 0.7% gain in yield; with 0.2% increase in area. Total consumption increases at 0.9%, solely from gain in per capita use, as population declines slightly. Real per capita income is up 1.9% per year.

The group of individually-modeled European countries (Table 72) is projected to grow total rice output by 0.9% per year, of which 0.7% comes from improvement in yield and 0.2% from increased area. Total consumption of this group gains 0.9% annually, mainly accounted for by growth in per capita use as population remains relatively flat. Real per capita income of this group grows at 1.7% per year.

Total rice production of the “Other Europe” region modeled as a group (Table 73) grows by 1.2% per year, as both yield and harvested area grow by 0.6% per year. Consumption of this group grows at 2.5% per year, with the 2.7% gain in per capita use being offset by a 0.2% decline in population. The real per capita income of this group grows strongly at 2.3% per year.

Oceania

Tables 74 thru 76 show the results for Oceania which mainly consists of Australia. Total rice production expands by 2.9% per year, accounted for by 1.3% gain in area harvested and 1.6% gain in yield. Total consumption grows 2.5% annually which comes from 1.4% growth in population and 1.1% gain in per capita use. Real per capita income grows at 1.3% annually.

World

Tables 77 thru 79 present the sum of the five world regions discussed above.

ECOWAS

Over the next decade, production of this 15-country region is projected to grow by 3.8% per year, which is accounted for by a 1.7% gain in harvested area and a 2.1% yield improvement (Tables 80-72). Consumption expands by 3.5% per year, driven by 2.8% population growth, 0.6% gain in per capita use, and 1.3% income growth. Net imports is projected to expand by 3.3 mmt over the next decade, equivalent to a growth rate of 3.4% per year—reaching 11.6 mmt by 2027.

Nigeria is the main player in the ECOWAS region’s projected fast-growing rice industry over the baseline period. The country accounts for 40% of the region’s volume growth in net imports, as the country’s domestic use continues to exceed domestic supply (Table 37mos).

Nigeria accounts for 30% of the region’s gain in both rice area harvested and rice output, owing to the country’s 3.6% annual growth in production supported by the strong growth in both area (1.3%) and yield (2.2%). Lastly, Nigeria accounts for 30% of the region’s volume growth in consumption, as the country’s consumption expands 3.4% annually with population growing at 2.6% and per capita use by 0.5% per year.

Results of Stochastic Baseline Analysis

Detailed Results of the Stochastic Baseline Analysis

The detailed results of the stochastic analyses for selected prices and trade are presented in Figures 14 thru 36. In order to show the direction and dispersion of the stochastic outcome distribution, four selected outcome items (stochastic average, 10th percentile, 90th percentile, and the coefficient of variation) for selected variables are presented. Intuitively, the gap between the two percentiles (10th and 90th) indicates the degree of volatility or risk associated with the variable of interest. As the gap widens there is an expected increase in volatility, while a narrowing gap indicates decreased volatility. Another measure of

dispersion used is the coefficient of variation (C.V.) which shows the extent of variability of data points in relation to the stochastic mean. A lower C.V. indicates more stability, i.e., less risk.

The information projected in each one of the charts is similar in principle. Hence, for space consideration only one representative chart (Figure 17) will be discussed--which can then be used as a basis to understanding the remaining charts. Figure 17 shows the long grain rice international reference price. For 2018, while the deterministic mean price generated by the baseline model is \$388 per mt (Table 5), the stochastic distribution indicates that 10% of the time the average price will be higher than \$547 per mt and 10% of the time lower than \$380 per mt. The computed C.V. for 2018 is 13.8%, which increases slightly through 2020 before declining steadily the rest of the projection period, reaching 11.5% by 2027. This feature of the stochastic analysis provides useful information as it indicates how the possible outcomes are distributed, thus providing a better understanding of the dynamics of the global rice market.

Summary and Conclusions

Global rice trade and prices are projected to grow steadily over the next decade, as exports expand in India, Vietnam, Myanmar, Thailand, and Cambodia; and imports continue to grow strongly in the Western African countries and the Middle East. Over the next decade, Thailand is projected to be replaced by India as the global leader in rice trade and the U.S is to be replaced by Myanmar in the top five rice exporters in the world.

Growth in global rice production comes mainly from yield improvements as area for expansion remains constrained in general. Abundant rice supplies are projected due to current surpluses, productivity growth using new technologies, and increases in production subsidies in many countries. Population remains the main driver of global consumption growth as average per capita use declines slightly.

Under the assumption of normal average weather, with global trade continuing to grow as deficit rice-consuming countries become more attuned to food security issues, an environment of reasonable, steady increase in global rice prices will likely prevail.

As in any other enterprise, however, there are risks involved in the rice industry due to the uncertainties of weather, domestic policies, political developments, and other unexpected events. Actual market outcomes usually deviate from average estimates hence a stochastic analysis is included in this report which indicate the probable upper and lower bounds (confidence intervals) of future possible distribution of prices and trade.

Some of the uncertainties in the rice market that may most significantly affect the baseline projections in this report include the following issues:

- India's reliability as a top exporter given the country's track record, and weather concerns;
- Uncertainty on PRC's high rice stockholding; impact on global prices of possible disposal;
- Will the high Western Hemisphere prices relative to Asian prices remain or will the margins converge?
- Likelihood of Sub-Saharan Africa and SE Asia attaining targeted productivity levels and self-sufficiency goals;
- Prevalent government subsidies in some countries, notably China, Indonesia, and the Philippines;
- Potential impact of production structural reforms (e.g., on the medium grain market in Japan);
- Availability of water for rice production in Australia, Egypt, and CA;
- Unexpected weather-related damages in rice-producing countries; and

- How trade policies/developments under the new administration will play out.

Depending on the developments on these issues going forward, these baseline projections can serve as benchmark for analyzing the potential impacts of specific scenarios on rice supply, demand, and prices. An example of this type of analysis can be gleaned from the study on trade policy responses to higher world agricultural commodity prices by Yu, T. Edward et al. (2017).

Lastly, the authors hope that the information contained in this report could serve as useful planning guide for various domestic and international stakeholders in the rice industry.
