THE HIRED FARM WORKING FORCE OF 1981, by Susan L. Pollack and William R. Jackson Jr., Economic Development Division, Economic Research Service, U.S. Department of Agriculture. Agricultural Economic Report No. 507 .

ABSTRACT

In 1981, approximately 2.5 million people 14 years of age and over did farmwork for cash wages and salary. The racial/ethnic composition of the work force was 73 percent white, 13 percent Hispanic, and 14 percent black and other. Fifty-five percent of the farmworkers were under 25 years old and 77 percent were male. At the time of the survey, more farmworkers resided in the South (40 percent) and North Central (28 percent) regions than in the Northeast and West. About four of five workers had nonfarm residences. The average annual earnings in 1981 were \$4,299, of which \$2,659 came from an average of 98 days of farmwork. Migrant workers accounted for only about 5 percent of all hired farmworkers.

Keywords: Hired farmworker, age, sex, racial/ethnic group, migrant, earnings, employment, education, Census Region, Standard Federal Region.

SALES INFORMATION

Additional copies of this report can be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Ask for The Hired Farm Working Force of 1981 (AER-507). Write to the above address for price and ordering instructions. For faster service, call the GPO order desk at (202) 783-3238 and charge it to your VISA, MasterCard, or GPO Deposit Account.

Microfiche copies (\$4.50 each) can be purchased from the Identification Section, National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. Ask for The Hired Farm Working Force of 1981. Enclose check or money order, payable to NTIS. For additional information, call the NTIS order desk at (703) 487-4780.

The Economic Research Service has no copies for free mailing.

## HIGHLIGHTS

In 1981, approximately 2.5 million persons 14 years of age and over did hired farmwork, according to the recent Hired Farm Working Force Survey. Most of the workers were less than 25 years old (55 percent), white (73 percent), and male (77 percent). Hispanics made up 13 percent of the work force and blacks and others made up 14 percent. The median level of education for hired farmworkers was 11 years. Eighty-four percent lived at nonfarm residences.

All workers averaged 98 days of farmwork. Nearly three-quarters of farmworkers worked fewer than 150 days at farmwork. Regular and year-round workers made up only one-quarter of the work force but accounted for 73 percent of total days worked.

In 1981, hired farmworkers earned an average of \$4,299 from both farmwork and nonfarmwork. Only \$2,659 of this average was earned from farmwork.

Forty percent of the farmworkers were in the South at the time of the December 1981 survey. Twenty-eight percent of the workers were in the North-Central Region, followed by 24 percent in the West. Only 8 percent of the farmworkers were in the Northeast.

Only about 5 percent of the hired farmworkers (115,000) were migrant laborers in 1981, a decline from the percentage in recent years. Seventy-five percent of the migrants were white, 17 percent were Hispanic, and 8 percent were black and other. Over half of all migrants (53 percent) worked fewer than 75 days at farmwork. Migrants earned an annual average of \$3,995, and farmwork accounted for \$2,728 of that amount.

Half of the farmworkers were not in the labor force for most of the year. Those who were primarily hired farmworkers made up 28 percent of the hired farm working force. Those who were primarily nonfarmworkers made up 17 percent and had the highest average annual earnings (\$8,341) in 1981. Hispanics earned twice as much from farmwork (\$4,319) as did blacks and others (\$2,668) and whites (\$2,359).

Over the past 10 years, the number of farmworkers between the ages of 18 and 44 increased, and the number of younger workers 14 through 17 decreased. The number of days spent at farmwork increased from an average of 198 million worker-days in 1969-71 to 257 million in 1979-81.

# The Hired Farm Working Force of 1981

## INTRODUCTION

About 2.5 million hired farmworkers earned cash wages or salary in 1981. According to the 1981 Hired Farm Working Force Survey, this was not significantly different from estimates in any year since 1968, when there were 2.9 million workers. Before 1968, there had been a long-term downward trend (table 1).

Through the 1960's, the migrant work force experienced a steady decline (table 2). Factors contributing to the decreased use of migrant labor included adoption of new technologies, changes in farm size, and new farm and farmworker programs. Since 1970, the number of migrant workers stabilized at around 200,000 and remained at that level until 1981. However, in 1981 the number of migrant farmworkers decreased by 47 percent to 115,000 from 217,000 only two years before.

Reasons for the decline in the number of migrants from 1979 to 1981 are not clear. One possible explanation is that the demand for migrant labor in agriculture has declined because of changing production levels and agricultural practices. However, an examination of various production data, including acres planted, acres harvested, value of production, and hours of labor required for various commodities in different regions did not provide conclusive evidence to support decreased labor demand. Also, information gathered from farm labor researchers in several States where migrants worked, as well as administrative data from Federal agencies servicing migrant farmworkers, did not generally support the idea of a diminishing need for migrant workers.

Another explanation for the decrease may be that farm operators are increasingly substituting illegal aliens for domestic farmworkers. The Hired Farm Working Force Survey probably enumerates few illegal workers, either because they have returned home before the time of the survey or because they avoid survey enumerators due to their illegal status. Therefore, an increased substitution of illegal workers for domestic laborers would appear as a decrease in the number of migrant workers in the survey data. Data on the number of illegal workers in agriculture are not available to allow a further examination of this premise.

1981	115	24	37	12	43

1/ Data are rounded to nearest thousand and may not add to total.

2/ No survey conducted.

Finally, because the migrant data are derived from a survey, there is the possibility of an estimation error or an increased nonsampling error associated with survey procedures (see appendix II). Additional evidence from the 1983 Hired Farm Working Force Survey is required to evaluate more closely the observed decrease in numbers of migrant farmworkers.

This report presents data on the demographic, social, and economic characteristics of persons 14 years of age and over who

did hired farmwork for at least 1 day during 1981.<sup>1</sup> The report focuses on the characteristics of racial/ethnic, regional, and migratory groups of farmworkers. It also summarizes some of the more important changes and trends over the past decade in the size, composition, and employment patterns of hired farmworkers.

Data in this report are from the Hired Farm Working Force Household Survey conducted for the USDA's Economic Research Service by the Bureau of the Census, U.S. Department of Commerce.<sup>2</sup> The survey sample of households includes each State and the District of Columbia, but excludes Puerto Rico and other U.S. territories and possessions. In 1981, approximately 58,000 households were interviewed; 1,555 contained persons who did hired farmwork in 1981. Information obtained from this sample of households was expanded to provide estimates of the total hired farm working force population.

The 1981 hired farm working force estimates are based on weights from the 1980 Census of Population. Estimates for 1972 to 1979 were based on weights from the 1970 Census of Population. The switchover from 1970 census weights to 1980 weights produced an "artificial bump" (slightly higher estimates) in the data series; however, the differences in the 1981 estimates based on 1970 and 1980 weights are not significant. For example, using the 1970 census weights, the 1981 total hired farmwork and migrant population estimates are 2,423,000 and 112,000, respectively. The estimates based on the 1980 census weights are 2,492,000 hired farmworkers and 115,000 migrants. Additional comparisons are presented in appendix table 17.

The Current Population Survey (CPS) is a probability sample survey, and standard errors can be derived for the estimates. Statements of comparison appearing in the text but not necessarily in the tables or figures are based on data significant at the 95-percent confidence level (two standard errors) or higher unless otherwise indicated. Additional information on the source and reliability of the survey estimates is provided in the appendix.

#### HIRED FARMWORKER TRAITS IN 1981

In 1981, most hired farmworkers were white, resided in the South and North Central Regions, and did not live on farms. Hired farmworker characteristics were as follows:

--73 percent were white, 13 percent were Hispanic, and 14 percent were black and other.

---

<sup>1</sup> Data for earlier years are available in The Hired Farm Working Force of 1979, AER-473, Econ. Res. Serv., U.S. Dept. Agr., Aug. 1981, and previous issues.

<sup>2</sup> Since 1977, the Hired Farm Working Force Survey has been conducted biennially in December as a supplement to the Current Population Survey.

--40 percent who were 25 years of age and over did not continue schooling past the eighth grade.

--5 percent were migrants.

--The median age was 23.9 years.

--84 percent did not live on farms at the time of the survey.

--40 percent resided in the South, and 28 percent resided in the North-Central Region.

### Age and Sex

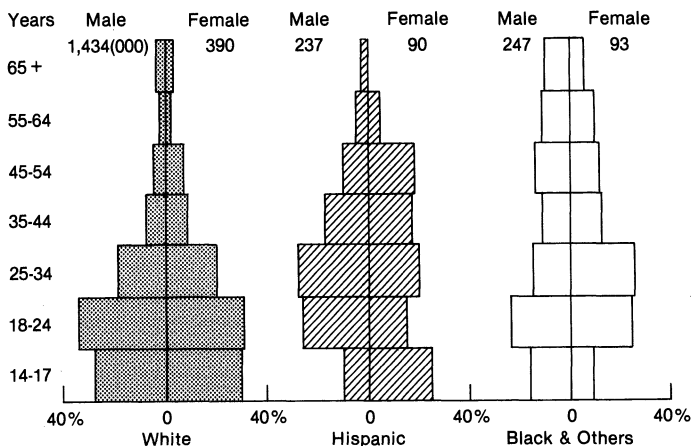

Fifty-five percent of all hired farmworkers were under the age of 25, and 77 percent were male. Twenty percent of the workers were 35 to 64 years old, and another 20 percent were between 25 and 34 years old.

White farmworkers were generally younger than minority workers. The median age for whites was 22.6 years, compared with 31.7 years for blacks and others and 29.9 years for Hispanics. Sixty-one percent of all whites were under 25 years old (fig. 1). Most minority farmworkers, on the other hand, were 25 years old and over. Male and female workers were about the same age within each racial/ethnic group. The large proportion of minority farmworkers in the higher age groups suggests these

Figure 1

### **Hired Farmworkers, 1981**

*By Age, Sex, and Racial/Ethnic Group*

See Appendix III for definitions of racial/ethnic categories.

workers have a strong attachment to farmwork. By contrast, most whites appear to use farmwork as a starting job or for supplemental income, and find nonfarm alternatives later.

### Household Status and Family Size

Farmworkers of all racial/ethnic groups were more likely to be household members than heads of households. However, heads of households were more likely to be employed for more days during the year than were other members of a household. Heads of households made up 67 percent of all farmworkers employed for 150 days or more during the year. This proportion was approximately the same for whites, Hispanics, and blacks and others. Only one third of the workers who worked fewer than 150 days were household heads.

The common perception that farmworkers are members of large families is not supported by the 1981 data.<sup>3</sup> Almost half of the farmworkers' families had three or fewer immediate members (table 3). Minority farmworkers' families were more likely to be larger than were white families; 29 percent of the Hispanic farmworkers and 28 percent of blacks and others came from families with at least six people. Only 13 percent of whites came from families of this size.

Families headed by a farmworker were smaller than those headed by a nonfarmworker. Sixty-one percent of the families headed by a farmworker had three or fewer members, compared with only 30 percent of the families headed by a nonfarmworker.

Large farmworker families had higher income levels more often than did small families. Of the farmworker families with incomes of at least \$15,000, 42 percent had five or more members, compared with 3 percent with one member and 11 percent with two members. Larger families had higher incomes, probably due to higher paying nonfarm jobs of family heads supplemented by income from other family members doing farmwork. Thus, these families were less dependent on farm earnings for their major source of income. Conversely, smaller families had lower incomes, probably because of greater dependence on farm earnings for their major source of income.

### Education

In 1981, hired farmworkers had a median education of 11 years. Forty percent of the workers had completed at least high school, compared with 29 percent who had completed less than 9 years (table 4). The large number of students doing farmwork during their school breaks contributed to the proportion of workers completing 9 or more years of school. About half of the students had completed from 9 to 11 years of school.

The education levels, however, varied by racial/ethnic groups. Hispanic farmworkers had the lowest education level with a median of 7.1 years, while blacks and others had a median of 9.6 years. White farmworkers, on the other hand, had a median

<sup>3</sup> Families are defined to include only those members of a household who are related to the head of household.

Table 3--Farmworker families, by selected characteristics and size of family, 1981

EMPLOYMENT AND  
EARNINGS

The average annual earnings of farmworkers in 1981 for both farmwork and nonfarmwork was \$4,299. Farmwork earnings are among the lowest of all occupations in the United States, although there are significant differences among farmworker groups. In 1981, the average annual earnings for all U.S. nonagricultural private sector production workers was \$13,270, more than three times the earnings of farmworkers.<sup>4</sup>

<sup>4</sup> Based on average weekly earnings, Employment and Earnings, U.S. Dept. Labor, Bureau of Labor Statistics, January 1983.

Hispanic farmworkers earned \$5,340, the highest annual farm and nonfarm earnings of all racial/ethnic groups, followed by whites who earned \$4,288, and blacks and others who earned \$3,358. While farmwork accounted for about 80 percent of the earnings of Hispanic and black and other farmworkers, it accounted for only about one-half the earnings of whites. Farmworker earnings of Hispanics were \$4,319, almost twice the farmwork earnings of blacks and others, \$2,668, and whites, \$2,359. Males earned almost twice as much as females from farmwork and nonfarmwork, \$4,829 versus \$2,526; heads of households earned more than 2.5 times as much as other household members, \$6,876 versus \$2,434.

### Days Worked

Farmworkers worked an average of 98 days at farmwork in 1981. Those who did only hired farmwork averaged about 129 days, and those who did both farmwork and nonfarmwork averaged 53 days of farmwork and 125 days of nonfarmwork. Earnings by days worked were as follows:

- Casual workers, who worked fewer than 25 days at farmwork, made up 39 percent of the farm work force and earned \$2,756 annually, \$216 of which was from farmwork.
- Seasonal workers who worked 25 to 74 days at farmwork made up 22 percent of the work force and earned \$2,799 annually, \$1,126 of which was from farmwork. Those who worked 75 to 149 days, 12 percent of all farmworkers, earned \$2,650 annually from farmwork and \$1,431 from nonfarmwork, for total annual earnings of \$4,081.
- Eleven percent of the farm work force worked 150 to 249 days at farmwork. These workers, classified as regular workers, earned \$6,669 annually, of which \$5,908 was from farmwork.
- Year-round workers, those working 250 days or more at farmwork, made up 16 percent of the hired farm work force. Their total average annual earnings were \$8,632, with \$8,461 from farmwork.

Casual and seasonal workers made up 73 percent of all workers but accounted for only 27 percent of the worker-days at hired farmwork (fig. 2).<sup>5</sup> Regular and year-round workers made up about 25 percent of the work force but accounted for almost 75 percent of the worker-days.

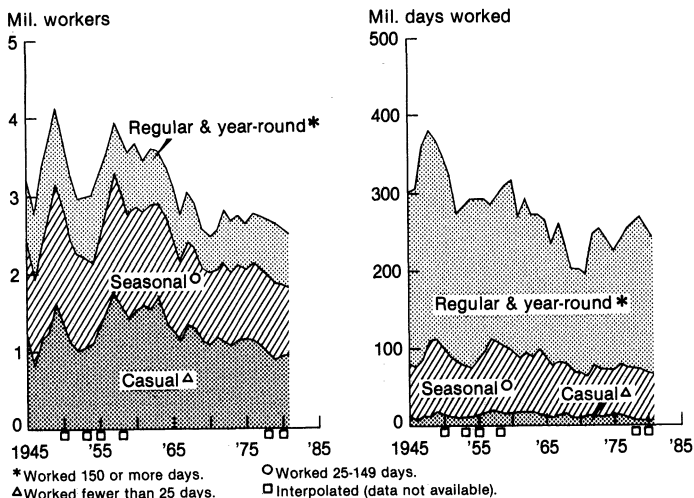

The number of days spent at farmwork varied by racial/ethnic group. White and black and other farmworkers spent fewer days

---

<sup>5</sup> A person completing at least 1 hour of farmwork during the day is credited with a worker-day of work.

Figure 2

## Hired Farmworkers and Worker-Days

in the year doing farmwork than Hispanics (fig. 3). Whites did farmwork for an average of 91 days in 1981; blacks and others averaged 104 days of farmwork; and Hispanics averaged 131 days. Forty-three percent of the whites and 35 percent of the blacks and others worked fewer than 25 days at farmwork, compared with 21 percent of the Hispanics (the differences in number of days worked between blacks and others and Hispanics are significant at the 90-percent confidence level). Additional differences regarding days of farmwork are:

- Female farmworkers were more likely than males to be casual workers. Over half (54 percent) of all female farmworkers did fewer than 25 days of farmwork, compared with 34 percent of the males. Conversely, only 9 percent of the females and 32 percent of the males worked 150 days or more.
- Nonmigrants were twice as likely as migrants to be casual workers.
- Farmworkers in Standard Federal Region IX, the Lower Pacific Coast States, were more likely to be regular and year-round workers than workers in other regions. Forty-three percent of the workers in Region IX worked 150 days or more.

Figure 3

### Hired Farmworkers, 1981

By Days of Farmwork and Racial/Ethnic Groups

See Appendix III for definitions of racial/ethnic categories.

#### Primary Employment Status

The hired farm working force is comprised mostly of people whose primary activity is not hired farmwork (table 5). Only 28 percent of the Hired Farm Working Force Survey respondents listed hired farmwork as their major activity, while nearly 50 percent of the workers were not in the labor force most of the year. The majority of this latter group were students who worked during school breaks.

The type of employment at which farmworkers spend most of their time affects their annual earnings. Hired farmworkers whose primary employment was in the nonfarm sector had the highest earnings. In 1981, they earned an annual average of \$8,341, of which only \$949 came from farmwork. Workers whose primary employment was hired farmwork earned an annual average of \$7,258, with \$6,981 from farmwork. Those workers who were only casual labor force participants, including students and housewives, had the lowest average annual earnings.

There were significant differences in the primary employment status among the racial/ethnic groups. Approximately 40 percent of white farmworkers were attending school, compared with 12 percent of the Hispanics and 24 percent of blacks and others (fig. 4). (The difference in the percentage attending school most of the year between blacks and others and Hispanics is significant at the 90-percent confidence level.) Minority

Figure 4

**Hired Farmworkers, 1981**

By Primary Employment Status and Racial/Ethnic Groups

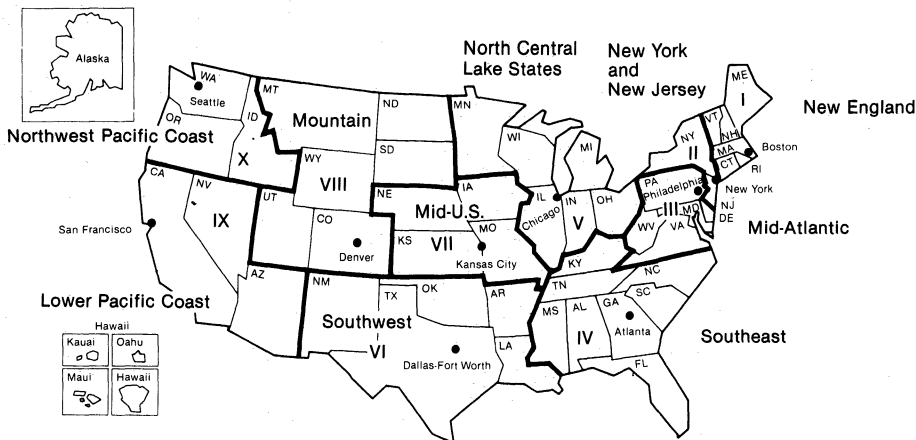

farmworkers cited hired farmwork as their principal activity more often than whites. Just over half of the Hispanics and 39 percent of the blacks and others said that hired farmwork was their major activity, compared with only 22 percent of white farmworkers. The majority of Hispanic and black and other farmworkers (79 and 75 percent, respectively) said that hired farmwork was their only employment during the year. Only 53 percent of white farmworkers cited hired farmwork as their only employment.

## REGIONAL DISTRIBUTION

The number and characteristics of hired farmworkers varied throughout the 10 Standard Federal Regions (SFR) (fig. 5). The demand for workers usually varied by type of crop and livestock activity, the length of the growing and harvesting seasons in the region, the extent of mechanization, and the scale of production. About 23 percent of all hired farmworkers were located in the Southeast (SFR IV) at the time of the December survey. The next largest concentration was in the North Central Lake States (SFR V) and the Southwest (SFR VI), where each had 15 percent of all workers. The Lower Pacific Coast (SFR IX) had 13 percent, and the Mid-United States (SFR VII) had 11 percent (table 6).

Figure 5

## Standard Federal Regions

### Racial/Ethnic Groups

The racial/ethnic composition of the hired farm working force also differed among the Standard Federal Regions. White farmworkers outnumbered minority farmworkers in all the Standard Federal Regions, except the Lower Pacific Coast, where the work force was made up of 49 percent Hispanic workers, 34 percent white, and 16 percent black and other. Hispanics also made up a larger percentage than blacks and others in the Southwest (SFR VI). Blacks and others, however, made up a significantly larger proportion of the farm work force than Hispanics in the Southeast (SFR IV), where 35 percent were blacks and others and 3 percent Hispanics. In the Mid-Atlantic Region (SFR III), 11 percent were blacks and others and less than 1 percent were Hispanics.

### Crop and Livestock Activity

In 1981, 20 percent of all hired farmworkers were employed in grain production, more than the percentage for any other single commodity (table 7). Over 20 percent of the farmworkers were primarily involved in the production of vegetables and fruits and nuts, and another 20 percent worked in livestock and dairy activities.

Employment in crop and livestock activities varied by racial/ethnic group. Whites and blacks and others were more often employed in field crop production than were Hispanics. About 52 percent of white farmworkers and 58 percent of black and

2/ Less than 0.5 percent.

other farmworkers worked in field crop production, compared with 31 percent of the Hispanic farmworkers. Hispanics, on the other hand, were primarily involved in the production of vegetables and fruits and nuts.

#### MIGRANTS

The number of migrant farmworkers in 1981 was significantly below the number in 1979. In 1981, only 115,000 workers reported that they did migrant work, compared with 217,000 in 1979. The 1981 estimate of migrant workers should be interpreted cautiously because it is based on a relatively small number of cases and the applicable standard errors may not fully reflect the extent of sampling and nonsampling errors. The estimate of 115,000 has a 95-percent confidence interval of 73,000 to 157,000 workers, compared with 159,000 to 275,000 workers for the 1979 estimate of 217,000 migrant farmworkers. Because of the low statistical reliability associated with the small estimate of migrant workers, some categories of data that have been published in previous issues of The Hired Farm Working Force are not presented for 1981.

Table 7--Number and distribution of hired farmworkers, by crop and livestock activity and racial/ethnic groups, 1981

<sup>1/</sup> A worker was assigned to the crop or livestock activity for which he or she worked the greatest number of days during the year.

<sup>2/</sup> Numbers and percentages may not add to totals due to rounding.

Migrant workers are defined as those individuals who travel across county or State boundaries and stay overnight to do farmwork for cash wages or salary. In 1981, migrants made up 5 percent of all farmworkers, and they were mostly white males, under 25 years of age, who spent most of the year out of the labor force as students (tables 8 and 9). Over half the migrants worked fewer than 75 days in the year at farmwork.

Migrant farmworkers earned an annual average of \$3,995 in 1981 from farmwork and nonfarmwork, about 68 percent of which came from farmwork. Thirty-seven percent of the migrants did hired farmwork as their primary occupation in 1981. Another 50 percent were not in the labor force; that is, they either attended school, kept house, or were retired or disabled. Migrant farmworkers who headed households made up 38 percent of all migrants.

About 40 percent of all migrants had completed high school, and about 40 percent of these graduates had some college education. However, some migrants had relatively low levels of education. Thirty-four percent had less than a ninth grade education and 7 percent were classified as functionally illiterate, having attended fewer than five years of school. These percentages were similar for migrant workers 25 years of age and over.

The backgrounds of migrant and nonmigrant farmworkers did not differ significantly (tables 8 and 9). Migrant workers were very similar to the rest of the hired farm working force in that both were made up predominantly of young males who spent only a small portion of their time at farmwork, probably to supplement other sources of income. The average annual earnings from farmwork and nonfarmwork for migrants and nonmigrants were \$3,995 and \$4,314, respectively. These earning levels were not significantly different, nor was there a significant difference between their annual average farm earnings.

#### TRENDS

Over the past 10 years, some characteristics of hired farmworkers have changed, although the number of workers has remained relatively stable (table 10). Whites made up a larger proportion of workers during the 1979-81 period than they did during the 1969-71 period. The number of black and other workers has declined by almost 38 percent during that time. Comparable data on Hispanic farmworkers are not available for both periods. Prior to 1975, data for Hispanic workers were included in either white or black and other categories based on the individual's race.

The ages of workers also changed. Fewer young people (ages 14 to 17 years) apparently entered hired farmwork. However, the number of workers 18 to 34 years of age increased, possibly indicating that workers stay in farmwork longer and depend more on their farm earnings. The number of workers 45 years of age and over decreased (table 10). These workers may have left farmwork either for nonfarm employment or early retirement.

1/ A 2-year average for 1979 and 1981 was used because the hired farm working force survey became biennial after 1977. Data for 1980 are not available.

2/ Percentages and numbers may not add to totals due to rounding.

3/ Hispanic data were not available for hired farmworkers for 1969-71.

\* Significant at the 90-percent confidence level.

\*\* Significant at the 95-percent confidence level.

The South still had more hired farmworkers than other regions but had not gained in relative share of workers. The only region showing a significant change was the North Central Region, where the number of workers increased by 21 percent.

Hired farmworkers are working more days a year at farmwork than they did 10 years ago, thus suggesting stronger attachments to farmwork for their primary source of earnings. While the largest proportion of workers still work fewer than 25 days at farmwork, their numbers have declined by 17 percent. The number of regular workers, however, has increased by almost two-thirds, and year-round workers have increased by over one-third. Overall, the number of worker-days increased from 198 million in the 1969-71 period to 257 million in the 1979-81 period. These increases are due in part to increased farm sizes, which require a larger hired farm work force to supplement family labor.

APPENDIX II:  
SOURCE AND RELI-  
ABILITY OF  
ESTIMATES

Estimates in this report are based on data obtained in December 1981 from supplementary questions in the CPS of the Bureau of the Census.

Sampling Procedures  
and Questionnaire  
Design

The CPS sample was initially selected from 1970 census files and is updated periodically to reflect new home construction. This sample includes 620 areas comprising 1,113 counties and independent cities in each State and the District of Columbia, but excludes Puerto Rico and other U.S. territories and possessions. Trained interviewers collected the information from approximately 58,000 U.S. households.<sup>6</sup> The supplementary questions on the December survey were asked of persons 14 years of age or older who performed farmwork for wages or salary during 1981. Questions concerned the number of days of farmwork for wage or salary, migratory status, hired nonfarmwork and wages, principal employment status in 1981, residence, and other matters. Persons performing hired farmwork during 1981 but who died, entered the armed forces, or were no longer in the civilian noninstitutional population for other reasons were not included. Also, foreign nationals who did hired farmwork in this country and returned to their homes before the field collection were not included.

The estimating procedure used for the CPS data involves the expansion of the sample results to independent estimates of the U.S. civilian noninstitutional population by age, race, and sex. These independent estimates are based on statistics from the 1980 Census of Population; statistics on births, deaths, immigration, and emigration; and statistics on the number of people in the armed forces.

Reliability of the  
Estimates

Since the CPS estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained from a complete census even if it had been taken using the same schedules, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey--sampling and nonsampling. Sampling standard errors are provided for data in this report, but the extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences among estimates.

Nonsampling Vari-  
ability

As in any survey work, results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources. A partial list would include inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or

<sup>6</sup> For a detailed explanation of CPS sampling procedures, see The Current Population Survey--A Report on Methodology, U.S. Bureau of the Census, Paper 7, U.S. Govt. Print. Off., 1963.

unwillingness to provide correct information, inability of respondents to recall information, mistakes made in recording or coding the data, mistakes made in processing data, mistakes made in estimating values of missing data, and failure to represent all units in the sample.

Undercoverage in the CPS results from missed housing units and missed persons within sampled households. Overall undercoverage, as compared to the level of the 1980 decennial census, is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than females and for blacks and other races than for whites. Ratio estimation to independent age-sex-race population controls partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

#### Sampling Variability

Since the size of most nonsampling errors is unknown, the reliability of an estimate is described only in terms of standard errors. These are primarily measures of sampling variability; that is, the variations that might occur by chance because a sample, rather than the whole of the population, is surveyed. As calculated for this report, the standard error also partially measures the effect of certain response and enumeration errors, but it does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error, and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

#### Comparability with Other Data

Data obtained from the CPS are not entirely comparable with data obtained from other governmental sources. This is due in large part to differences in survey processes. Therefore, caution should be used when comparing data in this report with data from other sources.

#### Standard Error Tables and Their Use

The figures presented in appendix tables 18 through 22 provide approximations of standard errors of various estimates shown in this report for data on total, white, and black and other hired farmworkers. To obtain standard errors for workers of Hispanic origin, multiply the standard errors in appendix tables 18 through 22 by 1.4.

Standard errors for values not shown in the standard errors tables may be approximated by interpolation. To derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard

errors (along with the factor for persons of Hispanic origin) provide an indication of the size of the standard errors rather than the precise standard error for any specific item.

Standard Errors of  
Estimated Numbers

Appendix table 18 shows standard errors,  $\sigma_x$ , for estimated numbers of hired farmworkers. Linear interpolation may be used to obtain standard errors for intermediate values not shown in the tables.

Alternately, standard errors can be calculated using the following formula (1), which was used to compute the tabular standard errors. Direct computation will give more accurate results than linear interpolation.

$$\sigma_x = c\sqrt{ax^2 + bx} \quad (1)$$

where x is the actual size of the estimate (not rounded to thousands); a is 0.000382; b is 3,796; and c is 1.0 for total, white, or black and other persons, and 1.4 for persons of Hispanic origin. Formula (1) is used to calculate standard errors for estimated numbers of hired farmworkers only.

Standard Errors of  
Estimated Percent-  
ages

Appendix table 19 shows standard errors of estimated percentages of hired farmworkers. The reliability of an estimated percentage, computed by using sample data for both numerator and the denominator, depends on both the size of the percentage and the size of the total on which the percentage was based. Estimated percentages are relatively more reliable than the

Appendix table 18--Standard errors for estimated numbers of  
hired farmworkers 1/

(68 chances out of 100)

Size of estimates	:	Standard error
:	:	
<u>Thousands</u>		
10		6
25		10
50		14
100		20
250		31
500		45
1,000		65
2,500		109
3,000		122

1/ To obtain approximate standard errors for persons of Hispanic origin, multiply the above standard errors by 1.4.

Appendix table 19--Standard errors of percentages of hired farmworkers <sup>1/</sup>

(68 chances out of 100)

Estimated percentage	Base of percentage in thousands								
	25	50	100	250	500	1,000	2,500	3,000	
	Percent								
1 or 99	3.9	2.7	1.9	1.2	0.9	0.6	0.4	0.4	
2 or 98	5.5	3.9	2.7	1.7	1.2	.9	.5	.5	
5 or 95	8.5	6.0	4.2	2.7	1.9	1.3	.8	.8	
10 or 90	11.7	8.3	5.8	3.7	2.6	1.8	1.2	1.1	
15 or 85	13.9	9.8	7.0	4.4	3.1	2.2	1.4	1.3	
25 or 75	16.9	11.9	8.4	5.3	3.8	2.7	1.7	1.5	
50	19.5	13.8	9.7	6.2	4.4	3.1	1.9	1.8	

<sup>1/</sup> To obtain approximate standard errors for persons of Hispanic origin, multiply the above standard errors by 1.4.

corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. Linear interpolation may be used to obtain standard errors for intermediate values of the percentages and the base of the percentage shown in appendix table 19. Or standard errors,  $\sigma(x,p)$ , can be calculated using formula (2). Direct computation will give more accurate results than linear interpolation.

$$\sigma(x,p) = c \sqrt{\frac{b}{x} p (100 - p)}, \quad (2)$$

where  $x$  is the actual size (not rounded to thousands) of the subclass of the population which is the base of the percentage;  $p$  is the percentage ( $0 \leq p \leq 100$ );  $b$  is 3,796; and  $c$  is 1.0 for total, white, or black and other persons and 1.4 for persons of Hispanic origin. Formula (2) is used to calculate standard errors for estimated percentages of hired farmworkers only.

#### Standard Errors of Estimated Averages

Averages are subject to large sampling variability since the sample estimates of an average are affected by extreme values. Appendix table 20 shows standard errors of average numbers of days of hired farmwork; appendix table 21 shows standard errors of average annual earnings; and appendix table 22 shows standard errors of average daily earnings. Linear interpolation may be used to obtain standard errors for intermediate values not shown.

In the source and reliability statement for tables 20 and 21 in The Hired Farm Working Force of 1979, standard errors were provided based on a new variance estimation procedure. However,

Appendix table 20--Standard errors of average number of days of hired farmwork <sup>1/</sup>

(68 chances out of 100)

27.00	1.68	1.19	.80	.62	.60	.56	.35	.32	
30.00	1.69	1.20	.81	.63	.61	.57	.36	.33	

<sup>1/</sup> To obtain approximate standard errors for persons of Hispanic origin, multiply the above standard errors by 1.4.

re-analysis of the 1979 standard errors via the variance a and b parameters showed that the individual curves were based on only a few items; thus, the reliability of these variances is questionable. Therefore, it is recommended that the parameters and tables in the 1981 report be used to calculate standard errors for 1979 data.

Illustration of Use of Standard Error Tables

Appendix table 1 of this report shows 2,492,000 persons performing hired farmwork in 1981. Interpolation of data in appendix table 18 shows the standard error for an estimate of this size to be approximately 109,000. Thus, the chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 109,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 218,000 (twice the standard error).

Appendix table 1 also shows 39 percent of the farmworkers worked fewer than 25 days. Interpolation in appendix table 19 indicates the standard error for 39 percent of a base of 2,492,000 would be approximately 1.9 percent. Consequently, chances are 68 out of 100 that the estimated 39 percent would have differed from a complete census figure by less than 1.9 percent; the chances are 95 out of 100 that the estimate would

have differed from a complete census figure by less than 3.8 percent. For example, the 95-percent confidence interval would be from 35.2 to 42.8 percent.

Standard  
Error of a  
Difference

For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squared standard errors of the estimates. The estimate can be of numbers, percentages, and averages. This method will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration  
of the Compu-  
tation of the  
Standard Error  
of a Difference

Appendix table 1 shows that 16 percent of farmworkers worked 250 days and over. The apparent differences between the workers who worked fewer than 25 days (39 percent) and those who worked 250 days and over is 23 percentage points.

Appendix table 19 shows, by interpolation, the standard error for 16 percent on a base of 2,492,000 to be approximately 1.4 percent ( $\sigma_x$ ). The standard error for 39 percent is 1.9 percent ( $\sigma_y$ ). To get the standard error of the estimated difference, formula (3) for the standard error of a difference is used as follows:

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} . \quad (3)$$

Therefore, the standard error of the estimated difference is

$$2.36 = \sqrt{(1.4)^2 + (1.9)^2} .$$

This means the chances are 68 out of 100 that the estimated difference based on the sample would vary by 2.36 percentage points from the difference derived using complete census figures. Since the standard error of the estimated difference (2.36 percentage points) is less than the difference between the two estimates (23 percentage points), it can be concluded with 68 percent confidence that the percentage of hired farmworkers who worked fewer than 25 days in 1981 is greater than the percentage of workers who worked 250 days and over in 1981.

APPENDIX III:  
DEFINITIONS  
AND EXPLANATIONS

Hired Farmworkers: Persons 14 years old and over in the civilian noninstitutional population of the United States at the time of the survey who did any farmwork for cash wages or salary at any time in the year, even if only for one day.

Farmwork for Cash Wages or Salary: 1) work done on any farm for cash wages or salary in connection with the production, harvesting, threshing, preparation for market, or delivery to market of agricultural products; 2) work done off the farm for

a farmer by farmworkers, such as trips to buy feed, seeds, or fertilizer, or to handle other matters involved in running the farm business; 3) repairs of farm buildings and machinery, for example, performed by a hired farmworker when done along with the type of work specified in (1) and (2) above; and 4) managing a farm enterprise for cash salary.

Not included as farmwork for cash wages or salary are: 1) work performed by farm operators on their own farms, or "exchange" work between farmers; 2) work done exclusively for "pay in kind;" 3) work done without pay on a family farm by a member of the farm operator's family (a small regular cash allowance is not considered as farm wages); 4) nonfarmwork performed on a farm, such as the building of a farm structure, drilling a well, hauling agricultural products to market by commercial truckers, or domestic service in the home of a farmer; and 5) custom work such as spraying, threshing, and combining when a person is paid a combined rate for the use of equipment and labor.

Work Classification: Casual workers--persons who worked fewer than 25 days at farmwork. Seasonal workers--persons who worked 25-149 days. Regular workers--persons who worked 150-249 days. Year-round workers--persons who worked 250 days or more.

Days of Hired Farmwork or Nonfarmwork: Days on which any hired farmwork or nonfarmwork was reported. The work may have been for all or only part of a day.

Earnings from Farmwork and Nonfarmwork: Total cash wages or salary received for farmwork or for nonfarmwork. Estimates of earnings do not include the value of perquisites received in connection with farmwork nor the value of fringe benefits received in connection with nonfarmwork.

Primary Employment Status (termed "chief activity" in reports prior to 1976): Information on the primary employment status of hired farmworkers during the year was derived from the question, "What was \_\_\_\_\_ doing most of 1981--working, keeping house, going to school, or something else?" If the initial response was "working," the kind of work the person was doing most of the year was determined. "Hired farmwork" was recorded if most of a person's work was farmwork for cash wages or salary. "Other farmwork" was recorded if most of a person's working time was spent operating a farm (as a tenant, owner, or sharecropper) or as an unpaid family farmworker. "Nonfarmwork" was recorded if most of a person's working time was spent operating a nonfarm business, in a profession, working without pay in a family nonfarm business, or working for pay (or pay in kind) in any nonfarm activity (such as manufacturing, trade, construction, and domestic services). For the person who did not report "working" as the primary activity, information was obtained on what he or she was doing most of the year. "Looking for work" (unemployed) was reported for a person who spent most of the time without employment but was actively looking for a job. "Keeping house" was reported for a person

who spent most of the time doing his or her own housework. "Going to school" was reported for a person who spent most of the time during the year going to school. The category "other" was reported for a person who spent most of the time at some activity other than those named above.

Major Crop or Livestock Activity: Information on crop or livestock activity was derived from the question, "What crops or livestock did \_\_\_\_\_ work with most on the farm where he or she worked the greatest number of days in 1981?" Categories of response included grains, tobacco, cotton, other field crops, vegetables and melons, fruit or tree nuts, beef cattle, dairy, other livestock, nursery or tree crops, and other.

Migratory Status: Migratory workers are those who 1) left their home temporarily overnight to do hired farmwork in a different county within the same State or in a different State with the expectation of eventually returning home, or 2) had no usual place of residence, and did hired farmwork in two or more counties during the year. Nonmigratory workers are those who 1) did all their hired farmwork for the year in the same county in which they lived, 2) made a permanent move from one county to another during the year (even if they did hired farmwork in both counties), or 3) commuted daily across the county or State line to work and returned home each night.

Distance Traveled: Determined by asking the respondent, "What was the longest distance away from home that \_\_\_\_\_ traveled while doing farmwork for cash wages?" Interviewers were instructed to record the mileage traveled by the workers from the time they left their homesite until the time they reached the place that was the longest distance away from their home. Distance traveled does not include miles to return to homesite.

Age: Based on the person's age at his or her last birthday.

Education Completed: Derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not the grade was finished. Questions on educational attainment apply only to progress in graded public, private, and parochial elementary and high schools, whether day schools or night schools. Thus, schooling is that which may advance a person toward an elementary school certificate; a high school diploma; or a college, university, or professional school degree. Schooling in other schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Racial/Ethnic Group: Refers to division of the population into three mutually exclusive groups--whites, Hispanics, and blacks and others. "Ethnic origin" was determined for this report by asking respondents their origin or descent. The answer to this question may produce results somewhat different from results based on inferred ethnic identification using such characteristics as country of birth of the person or his or her parents, language spoken in the home, or surname. "Hispanic"

includes all Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Hispanic persons? "White" refers to white persons other than those of Hispanic origin. "Black and other" includes blacks and other groups such as Indians, Chinese, Japanese, and others not of Hispanic origin. For simplicity of presentation, these groups are termed whites, Hispanics, and blacks and others.

Family Income: As defined in this study, represents the combined total money income of the family head plus the income of all the head's relatives 14 years of age and over who were family members at the time of the survey. Family income includes wages and salaries, net income from business or farm, pensions, dividends, interest, rent, social security payments, and any other money income received by members of the family during the 12-month period prior to the interview.

Region: Hired farmworker data are presented in the report by two different regional aggregations of States, the four census regions and the 10 Standard Federal Regions.

States included in each of the four census regions are as follows: Northeast--Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, and New Jersey; North Central--Ohio, Indiana, Illinois, Wisconsin, Michigan, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas; South--Maryland, Delaware, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas; and West--Montana, Wyoming, Idaho, Colorado, New Mexico, Utah, Arizona, Nevada, Washington, Oregon, California, Hawaii, and Alaska.

The States included in each of the 10 Standard Federal Regions are as follows: Region I--Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont; Region II--New Jersey and New York; Region III--Delaware, District of Columbia, Maryland, Pennsylvania, Virginia, and West Virginia; Region IV--Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, and Tennessee; Region V--Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin; Region VI--Arkansas, Louisiana, New Mexico, Oklahoma, and Texas; Region VII--Iowa, Kansas, Missouri, and Nebraska; Region VIII--Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming; Region IX--Arizona, California, Hawaii, and Nevada; Region X--Alaska, Idaho, Oregon, and Washington.

Residence: Based on the classification of the place in which the worker lived at the time of the survey. Farm--hired farmworkers were classified as living on farms (farm residents) if they lived on places from which at least \$1,000 worth of agricultural products were sold or normally would have been sold in the reporting year. Prior to 1981, the old farm definition was used, with farm residents classified as those living on a place of 10 or more acres of land from which at least \$50 worth of agricultural products were sold, or less than 10 acres if as

much as \$250 worth of agricultural products were sold from the place in the reported year. Nonfarm--workers who lived in urban places, rural towns or villages, or in the open country on places that did not meet the criteria for farm classification.

# Northern Great Plains Coal Mining

What are the likely effects of expanded coal mining in Montana, Wyoming, and North Dakota on the small towns and communities there? Mining activity in the sparsely populated region has grown dramatically over the last decade—from less than 20 million tons of coal in 1970, to 100 million tons in 1978, with projections for 350 million tons per year by the mid-1980's.

The Fort Union coal formation, which straddles those three States contains nearly 40 percent of the Nation's coal reserves. Its coal is highly desirable because:

—It is low in sulfur, meaning that it can be burned by utility companies with less air pollution than other coal.

—It is in thick seams (some seams up to 200 feet thick), and can be recovered by strip mining.

To try to ascertain the effects of development on the region, the authors

of this report used computerized simulations of various levels of coal activity to see if the communities could afford the increased level of government services and upgraded infrastructure required by new energy projects and the larger population attracted by those projects.

In the long run (10 years or more), most communities in the region will be able to pay for the services required by the new coal-related development, provided that they can tax the new developments. Without taxing authority (for instance, if the mine lies outside the taxing district of a locality), they will have problems.

*Northern Great Plains Coal Mining: Regional Impacts* by Thomas F. Stinson, Lloyd D. Bender, and Stanley W. Voelker; A1B-452; July 1982; 36 pages; color illustrations; \$5; stock no. 001-000-04265-3).

## Mineral Tax Laws Reviewed

State taxes on mineral production yielded more than \$4 billion in revenues for 17 major mineral-producing States in 1980 and accounted for more than 20 percent of total tax revenues in 7 States. Yet, raising State revenues seems to be only a minor reason for many States in taxing mineral resources. In addition, taxing minerals presents problems unlike those involved in other kinds of taxes (how and when to assess the value of the minerals, for example).

*State Mineral Taxes, 1982*, summarizes the mineral tax laws in 31 States and includes special uses for which the tax revenues are earmarked.

The report tells you:

- Why States levy special taxes on minerals. The explanations usually given include recovering the cost of increased State services, mitigating adverse effects of increased economic activity, and ensuring a fair return to citizens (including future generations) for depleting the State's natural heritage.

- How State laws have fared in legal challenges and the reasons given by the courts in overturning some tax laws while upholding others.
- The most common kinds of severance taxes levied on minerals, how they differ from one another, and how they compare with one another on factors like ease of administration, equity, and so forth.

For your copy of *State Mineral Taxes, 1982* (Thomas F. Stinson and George S. Temple; 72 pages; \$4.50), write to Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
