PREFACE

This annual report contains summary estimates of costs and returns for 1966 and other recent years on 44 important types of commercial farms in 25 major farming areas in the United States (fig. 1), together with a brief analysis of changes that have occurred in production, prices, income, and costs for each of these types of farms.

This is the 21st annual report. It includes information for two important types of farms not reported on in previous reports. They are representative of tobacco-beef and tobacco-dairy farms in the Pennyroyal area of Kentucky and Tennessee. This area is particularly important in the production of dark tobacco. The 1964 U.S. Census of Agriculture shows that 42 percent of the U.S. acreage of dark-fire cured tobacco and 40 percent of the dark-air cured tobacco is in the counties that comprise this area. Most of the tobacco farms in the Pennyroyal area produce tobacco in combination with a livestock enterprise.

Estimates are reported for 42 types of farms for the years 1954-63 in USDA Statistical Bulletin 368 and for 37 types for the years 1930-57 in USDA Statistical Bulletin 297. Concepts and procedures are discussed briefly in Statistical Bulletin 368. Additional information is available for 1965 and 1966 for each of the major groups of farms in the Farm Costs and Returns (FCR) Series, Nos. 45 through 53, published by the Economic Research Service.

Data in these reports represent results of operations on typical or representative farms of the specified type and size. In all instances, the typical farms are important operating units in the specified area, and in most instances they are the most common units.

For example, of the approximately 30,500 farms in western Wisconsin (fig. 1) about 81 percent were classified in the 1964 census as commercial farms, and 82 percent of these were dairy farms. According to a recent survey, 75 percent of the dairy farm operators sold grade-B milk (for manufacturing purposes). Typical commercial family-operated dairy farms in this area have 20 to 25 milk cows and heifers, 2 years old and over. They are by far the most common

type and size of farm in the area and probably constitute 70 percent of the dairy farms producing grade-B milk in Western Wisconsin.

In contrast, there are several different types of farms in the hog-beef fattening area of the Corn Belt. Beef fattening farms are probably the most common, but they vary considerably in size and method of operation. Some operators fatten hundreds of animals a year, mostly with purchased feed; other operators grow nearly all the feed for the 50 to 60 head they fatten each year.

In 1966, the operators of typical hog-beef fattening farms represented here cultivated an average of 140 acres of feed grains, farrowed about 38 sows, and in the fall bought 80 to 100 feeder cattle. The cattle were to be fattened and sold early the next fall. Although this is a common operation, results are not likely representative of some other beef fattening farms.

Data in this report supplement estimates of aggregate income and expenses for all farms in the United States, as reported quarterly and annually by the Department, and those reported by various experiment stations and related research groups. Estimates for more types and sizes of farms would be required for expansion to regional and national totals.

The same general procedure, methodology, and terms are used for all types of farms. Thus, these annual publications provide a continuing source of information and a measure of year-to-year changes in farm size, farm organization, technology, investment, prices, costs, and returns on several important types of commercial farms.

For comparability of results among types of farms in these series, all farms are considered to be owner-operated units. Net farm income is the return to the operator and members of his family for their management and labor on the farm, and return to total farm capital. To obtain an estimate of return to operator and family labor, an estimated charge is made for capital. It should be noted, however, that a charge for capital represents a return to the owner of the capital.

Any charge for capital on a group of farms must be arbitrary. Farm assets vary greatly in kind, and are purchased at different times; a farmer buys a new machine or some livestock, for example, or decides to add to his farm acreage. Most farmers and ranchers make new investments each year. Some farm assets have a ready market, while others may be disposed of only at a sacrifice. Thus, it is difficult to determine a correct and valid charge for farm capital.

In this report, two alternative capital charges have been made. The first is obtained by multiplying total capital invested in the farm business, regardless of ownership, by the current interest rate in effect January 1 for new loans by the Federal land bank in the respective area. In 1966, this rate was 5.5 percent in nine districts, 6.0 percent in two districts, and midway between in one district. From 1930 to 1966, the rate varied from 4 percent to 6 percent.

The second estimate of capital charge is obtained by multiplying total investment in the farm business January 1, again irrespective of ownership, by 4.1 percent. This is the average rate paid by farmers on outstanding debts held by Federal land banks from 1940 to 1960. In this 21-year period, the rate varied from 3.5 percent to 4.6 percent; in 11 of the 21 years, it was 4.1 percent.

Whichever method is used, a further charge is added for production credit on farms where applicable. Such a charge was made on 28 of the 44 typical farms. Mainly, these were farms on which sales were seasonal. Production credit is calculated at short-term interest rates charged by production credit associations on loans outstanding.

The major sources of data for these costs and returns series are: (1) the U.S. Census of Agriculture, (2) rural carrier and mailed questionnaires sent to farmers and dealers by the Agricultural Estimates Division, Statistical Reporting Service, USDA, (3) enumerative field surveys, and (4) research results and related data from State experiment stations and Federal agencies when data for individual farms are available or when group

data meet the specifications for farms by type, size, and location. Data for individual farms of a particular type and size are generally used. Local area data on production rates, prices, and related items are used when they do not differ significantly by type and size of farm.

Many factors need to be considered in comparing the different types of farms and typical farm data with national averages and averages for specific areas. Returns in 1966, compared with those for earlier years, reflect adjustment by farmers on specified farms to meet changing physical and economic conditions. Weather has an important role in determining farm income. Year-to-year changes in weather tend to produce corresponding changes in crop production, and these changes in turn affect livestock production and farm expenses and income. Farm size, intensity of land use, investment per farm, and the proportions invested in real estate, machinery, and livestock vary among types of farms and considerably affect farm incomes.

This report was prepared in the Farm Production Economics Division, Economic Research Service, by Wylie D. Goodsell, J. Albert Evans, Erling Hole, Edgar B. Hurd, Owen K. Shugars, Edwin G. Strand, and Isabel Jenkins.

John H. Bondurant, University of Kentucky, cooperated in preparing estimates for the tobacco-livestock farms in the Bluegrass area of Kentucky and the Pennyroyal area of Kentucky-Tennessee. Luther H. Keller, University of Tennessee, also cooperated in preparing estimates for the tobacco-livestock farms in the Pennyroyal area. James R. Gray, New Mexico State University, cooperated in preparing estimates for the livestock ranches in the Southwestern and Northern Plains areas. R. G. Latimer, Rutgers University, cooperated in preparing estimates for the egg-producing farms in New Jersey. William T. McAllister, University of Delaware, cooperated in preparing estimates for the broiler farms in the Delmarva area. Frank D. Reed, University of Maine, cooperated in preparing estimates for the broiler farms in Maine.

FARM COSTS AND RETURNS: COMMERCIAL FARMS BY TYPE, SIZE, AND LOCATION

IN GENERAL

Net Farm Income Changes on Typical Farms

Net farm incomes in 1966 were higher than in 1965 on 34 of 44 important types of commercial farms located in 25 major farming areas of the United States (tables 1 and 2). Net farm incomes were lower than in 1965 on nine types of farms and about the same in both years on one type. Increases in net income ranged from 2 percent on small cotton farms in the Mississippi Delta to 84 percent on egg-producing farms in New Jersey. Increases in income exceeded 20 percent on half of the farm types which had higher incomes in 1966.

Declines in net farm income from 1965 levels ranged from 1 percent to 75 percent. For all but two of the farm types, reductions in income were in the magnitude of 10 percent or less. Income declined 75 percent on cotton-specialty crop farms in the San Joaquin Valley and 27 percent on broiler-crop farms in Delmarva. Cotton-specialty crop farmers suffered a sharp decline in potato prices in 1966 and incomes dropped. However, net returns on cotton-specialty crop farms in 1965 were more than double the previous 5-year average. Incomes declined on broiler-crop farms in Delmarva because of a substantial reduction in crop yields.

Net farm incomes in 1966 as compared with the 5-year period (1960-64) were higher on 37 farm types, lower on six types and about the same on one type.

As with net income, gross farm income in 1966 was higher than in 1965 on 34 of the 44 types of farms (table 3). Of the nine farm types with lower gross incomes in 1966 seven were cotton farms. Operating expenses rose on 33 types of farms, remained the same on one type and declined on 10 types. Nine of those with lower expenses in 1966 were cotton farms. On many cotton farms in 1966, substantial diversion of cotton acreage under the cotton program reduced both gross income and operating expenses.

Most of the farm types that had higher net farm incomes in 1966 either received higher prices for products sold or had greater farm production or both (tables 4 and 5). Exceptions were the small and large-scale cotton farms in the Mississippi Delta and irrigated cotton farms in the Texas High Plains. Net farm production on these three types of farms was less than in 1965, and prices received averaged the same as or lower than in 1965. Higher Government payments and lower operating expenses were important factors leading to higher net incomes on these three farms in 1966.

With the exception of hog-beef fattening farms in the Corn Belt, all the farm types with lower net incomes in 1966 either received lower prices for products sold or reduced farm production or both. Higher operating expenses, due chiefly to higher prices paid for feeder calves, more than offset increased farm production and slightly higher prices

¹ Preliminary:

Note: Information presented here is on an owned-operator basis primarily for comparability between types of farms. Net farm income is the return to operator and unpaid members of the family for their labor and management on the farm and return to total capital. No allowance has been made for payment of rent, interest or mortgage.

² Includes cropper labor.

received on hog-beef fattening farms.

Prices received for products sold in 1966 as compared with 1965 advanced on 32 of the farm types, remained unchanged on three and declined on nine (table 4). Prices received were higher in 1966 than in the 5-year period on 31 of the farm types, lower on 11 and the same on two types.

Net farm production in 1966 was below 1965 production on 25 of the 44 types of farms, about the same on one type and greater on 18 types (table 5). Production declined in 1966 on all the cotton farms studied, except in the Black Prairie of Texas, and on all the wheat farms, except wheat-fallow farms in the Pacific Northwest. Production was greater than in 1965 on these two types of farms because of substantial increases in yields per acre. Compared with the 5-year period net farm production in 1966 was higher on 30 of the 44 farm types. Other Summary measures can be found on tables 6 to 8 on pages 8 to 10.

Net Farm Income Changes on All U.S. Farms

Total net farm income (including net change in inventory) for all farms in the United States was \$16.1 billion in 1966. This was almost a billion dollars more than in 1965 and was the second highest on record. Net farm income per farm averaged \$4,955 in 1966, compared with \$4,493 in 1965 (fig. 2). The increase of 10 percent in net farm income per farm resulted from an increase of 6 percent in total net farm income and a decline of 4 percent in the number of farms.

Realized gross farm income in 1966 totaled \$49.5 billion, a new high

record, exceeding the 1965 figure by 10 percent. Receipts from sales of livestock and livestock products were up 13 percent and receipts from sales of crops were up 5 percent. Government payments to farmers for participating in farm programs were about a third larger in 1966 than in 1965.

Receipts from marketings of livestock and livestock products were estimated at \$24.7 billion in 1966, an increase of about \$2.8 billion from the previous year. Receipts from cattle were up about \$1.5 billion and from hogs about \$300 million, mainly because of higher prices received. Dairy products brought over \$500 million more in 1966 than in 1965, due to the sharp rise in the average wholesale price of milk, even though the quantity of milk sold was slightly less in 1966. Cash receipts from broilers, eggs, and turkeys were up about \$130 million, \$300 million, and \$70 million, respectively. Prices received for eggs averaged 16 percent higher than in 1965.

Receipts from crop marketings in 1966 were estimated at \$18.2 billion, a total of \$900 million more than in 1965. Contributing to this increase were mainly the larger receipts from sales of wheat, corn, soybeans, sorghum grain, truck crops, fruits, nuts, and tobacco. Cash receipts from marketings of cotton were down primarily because of a sharp reduction in production, and receipts from potatoes were smaller because of lower prices.

Government payments direct to farmers were reported at \$3,272 million in 1966, compared with \$2,452 million in 1965. The major part of the increase came from the cotton program payments, which amounted to \$773 million in 1966, compared with \$70 million in 1965.

Payments under the wheat program, totaling \$679 million, were 29 percent greater than in 1965, whereas feed grain program payments at \$1.2 billion were about 9 percent smaller.

Total production expenses in 1966, estimated at \$33.2 billion, were 8 percent higher than in 1965. Production expenses per farm averaged \$10,215, up 12 percent from 1965 (fig. 3). Nearly half of the increase in expenses resulted from larger outlays for feed and livestock purchasing. Feed prices averaged 5 percent higher and prices paid for feeder cattle and replacement livestock averaged 11 percent higher than a year earlier. Also, farmers bought more feed and more cattle for fattening in 1966.

Expenditures for fertilizer increased in 1966 mainly because larger quantities were used. Expenses for operation and repair of power equipment and machinery and for many miscellaneous items were larger than in 1965.

Total expenditure for hired labor in 1966 was about the same as in 1965. Wage rates were up about 8 percent, but fewer workers were hired.

Farm overhead costs continued to rise in 1966. The rapid rate and high level of capital accumulation in recent years and the higher prices of equipment resulted in a substantial increase in depreciation charges. Interest rates generally, and short-term interest charges particularly, were higher than in 1965. Also, farmers borrowed more money, so the total amount of farm debt (real estate and non-real estate) was larger than ever. Total interest payments were higher than in any previous year. Taxes on farm property generally were at record high levels.

For Groups of Farms

Changes from 1965 in net farm income by type of farm demonstrated the usual variation. Some farm types showed substantially larger gains than the average for all farms in the United States. On the other hand, net farm income declined sharply on other types of farms.

Net farm incomes in 1966 averaged markedly above those of 1965 on all of the dairy farms studied. Both production and prices received were higher than in 1965, more than offsetting higher prices paid and increased operating expenses.

Changes from 1965 in net farm income on broiler farms were mixed. Three types showed increases ranging from 5 to 45 percent. However, on Delmarva broiler-crop farms income was down 27 percent because of a big drop in crop yields. Broiler production per farm increased in 1966; the contract payment rate ranged from about the same as in 1965 in Maine to an increase of 13 percent in Georgia. Broiler returns were up on all four types with Georgia showing the largest gain.

In the Corn Belt, income in 1966 ranged from 8 percent below 1965 on hog-beef fattening farms to 33 percent above 1965 on hog-dairy farms. Gains in production per farm and/or in prices received offset higher expenses on all Corn Belt farms except the hog-beef fattening farms.

Changes in net farm income on cotton farms in 1966 varied widely. On the 10 farm types studied, net returns were above 1965 levels on five and lower on five. Participation in the 1966 cotton program was high in all areas. This led to reduced

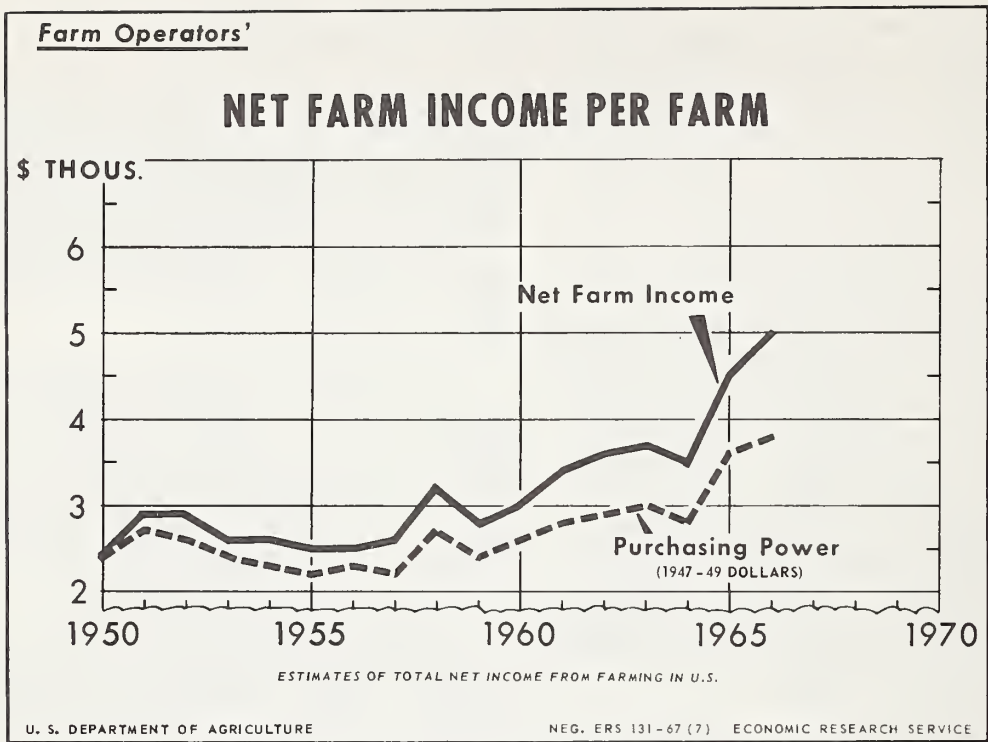

Figure 2

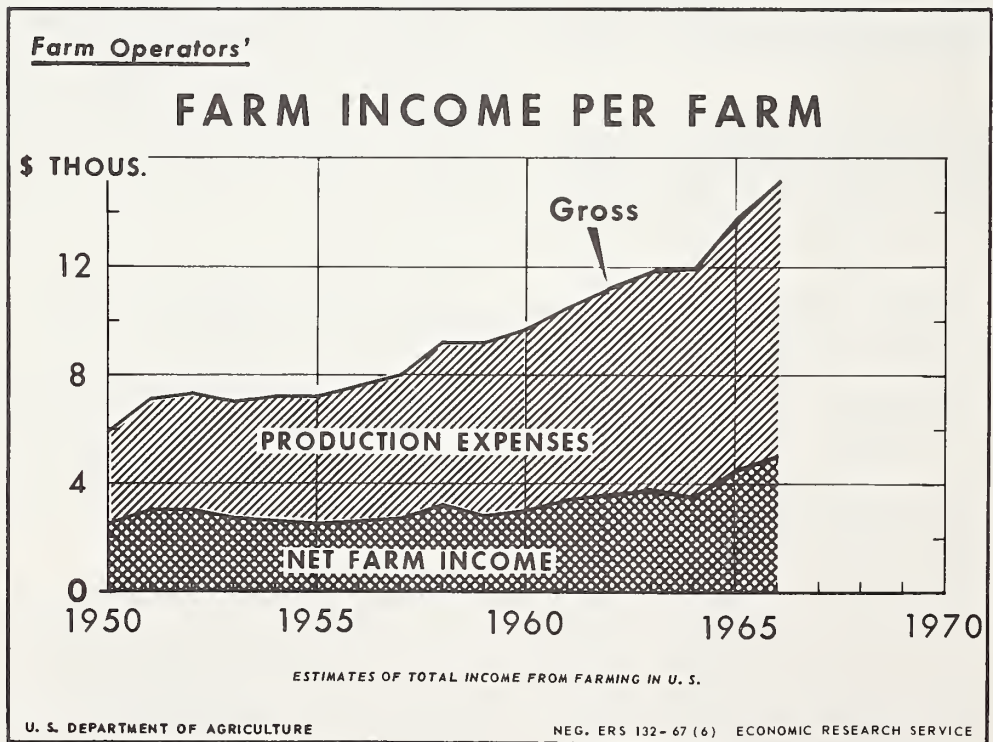

Figure 3

acres of cotton harvested per farm and higher Government payments as compared with 1965. Cotton yields per harvested acre in 1966 averaged below a year earlier on eight of the cotton farms studied. Reduced farm production and lower average prices received contributed to the decline in returns on four of the cotton farms. On peanut-cotton farms, prices received advanced 5 percent in 1966, but farm production was off sharply and net farm income was down 8 percent. Chiefly because of smaller cotton acreages per farm, operating expenses on cotton and peanut-cotton farms averaged from about the same to 15 percent below 1965 levels. Lower expenses were important factors contributing to increased net returns on cotton farms in the Delta and irrigated cotton farms in the High Plains.

Net farm incomes in 1966 were greater than in 1965 on all seven types of tobacco farms studied. Prices received averaged from 7 to 11 percent above 1965. Net farm production increased on four of the seven types.

Net farm incomes in 1966 averaged from 5 to 56 percent higher than

in 1965 on the seven types of wheat farms for which estimates were made. Production was down on all except one type, and prices received were up on six of the seven farm types. On wheat-fallow farms in the Pacific Northwest both production per farm and prices received were well above 1965 averages, and net farm income advanced 56 percent.

Compared with 1965, net incomes in 1966 on western cattle ranches ranged from about the same on Northern Plains ranches to 19 percent higher in the Southwest. Prices received averaged above the 1965 levels in the three areas studied, but production and production conditions varied. Net ranch production declined in the Northern Plains and Intermountain Region. It remained about the same as in 1965 in the Southwest.

Changes from 1965 in net ranch income on sheep ranches ranged from a decline of 10 percent in the Northern Plains to an increase of 26 percent in the Southwest. Both production and prices received were lower in 1966 compared with a year earlier in the Northern Plains. Both were higher in the Southwest.
