The Impact of Crop Insurance on Farm Credit and Investment Decisions

Elizabeth Berger ¹ Jennifer Ifft ² Margaret Jodlowski ³ Todd
Kuethe ⁴

¹Johnson Graduate School of Management, Cornell Univ.

²Department of Agricultural Economics, Kansas State Univ.

³Department of AEDE, Ohio State Univ.

⁴Department of Agricultural Economics, Purdue Univ.

NC-1177 2020 Virtual Annual Meeting
October 21, 2020

This research was supported through a cooperative agreement with the USDA Office of the Chief Economist and Risk Management Agency.

Introduction

Risk management increases firm value:

Introduction

Risk management increases firm value:

- Strong correlation between operating credit levels and federal crop insurance (FCI)

Introduction

Risk management increases firm value:

- Strong correlation between operating credit levels and federal crop insurance (FCI)
- Improves ability to invest

Introduction

Risk management increases firm value:

- Strong correlation between operating credit levels and federal crop insurance (FCI)
- Improves ability to invest
- Productivity gains

Introduction

Risk management increases firm value:

- Strong correlation between operating credit levels and federal crop insurance (FCI)
- Improves ability to invest
- Productivity gains

Research Questions

One

How does FCI change the amount and type of credit used?

Research Questions

One

How does FCI change the amount and type of credit used?

Two

What sort of investment does increased risk management promote on-farm?

Research Questions

One

How does FCI change the amount and type of credit used?

Two

What sort of investment does increased risk management promote on-farm?

Three

To what extent is capital-labor substitution another channel by which risk management augments firm value?

Mechanisms

Mechanisms

- Theoretical models of risk balancing (Gabriel and Baker, 1980)

Mechanisms

- Theoretical models of risk balancing (Gabriel and Baker, 1980)
- Overcoming credit constraints (Liang, 2014)

Mechanisms

- Theoretical models of risk balancing (Gabriel and Baker, 1980)
- Overcoming credit constraints (Liang, 2014)
- FCI as collateral: lenders driving relationship

Mechanisms

- Theoretical models of risk balancing (Gabriel and Baker, 1980)
- Overcoming credit constraints (Liang, 2014)
- FCI as collateral: lenders driving relationship
- Lower variability of income increase demand for investment

Mechanisms

- Theoretical models of risk balancing (Gabriel and Baker, 1980)
- Overcoming credit constraints (Liang, 2014)
- FCI as collateral: lenders driving relationship
- Lower variability of income increase demand for investment
- Estimation strategy can identify only direct relationships with crop insurance; use theory to form connections between them

Summary

Summary

Data

91,000 farm-year observations from ARMS cross section; 30,000 farm-year observations from the ARMS unbalanced panel

Summary

Data

91,000 farm-year observations from ARMS cross section; 30,000 farm-year observations from the ARMS unbalanced panel

Empirical Strategy

Unbalanced panel and FCI program coverage limits as an instrumental variable for insurance coverage (premiums paid per acre)

Summary

Data

91,000 farm-year observations from ARMS cross section; 30,000 farm-year observations from the ARMS unbalanced panel

Empirical Strategy

Unbalanced panel and FCI program coverage limits as an instrumental variable for insurance coverage (premiums paid per acre)

Results

Increased FCI:

- 1) Increases in the quantity and intensity of short term debt use;
- 2) Increased equipment value and more labor-saving equipment used;
- 3) Increases farm household specialization: increased operator on-farm hours with decreased spouse on-farm hours

USDA Agricultural Resource Management Survey (ARMS)

USDA Agricultural Resource Management Survey (ARMS)

- Unbalanced panel Panel summary statistics

USDA Agricultural Resource Management Survey (ARMS)

- Unbalanced panel Panel summary statistics
 - ARMS observations can be linked over time (Weber et al., 2016)
 - Use data from 2000-2014
 - Farms must have had at least \$10,000 in sales from the primary insurable crops
 - Must have participated in FCI in at least one year

USDA Agricultural Resource Management Survey (ARMS)

- Unbalanced panel Panel summary statistics
 - ARMS observations can be linked over time (Weber et al., 2016)
 - Use data from 2000-2014
 - Farms must have had at least \$10,000 in sales from the primary insurable crops
 - Must have participated in FCI in at least one year
- Operations with and without crop insurance differ markedly panel

USDA Agricultural Resource Management Survey (ARMS)

- Unbalanced panel Panel summary statistics
 - ARMS observations can be linked over time (Weber et al., 2016)
 - Use data from 2000-2014
 - Farms must have had at least \$10,000 in sales from the primary insurable crops
 - Must have participated in FCI in at least one year
- Operations with and without crop insurance differ markedly panel
- Measure crop insurance participation using premiums paid per acre

Instrumental variable

- Simultaneity between financial decisions and the decision to enroll in crop insurance

Instrumental variable

- Simultaneity between financial decisions and the decision to enroll in crop insurance
- Use the IV developed by Weber et al. (2016):

Instrumental variable

- Simultaneity between financial decisions and the decision to enroll in crop insurance
- Use the IV developed by Weber et al. (2016):
 - Maximum coverage levels means that some farmers can increase coverage more than others

Instrumental variable

- Simultaneity between financial decisions and the decision to enroll in crop insurance
- Use the IV developed by Weber et al. (2016):
 - Maximum coverage levels means that some farmers can increase coverage more than others
 - Program limits are plausibly exogenous to current decision making

Instrumental variable

- Simultaneity between financial decisions and the decision to enroll in crop insurance
- Use the IV developed by Weber et al. (2016):
 - Maximum coverage levels means that some farmers can increase coverage more than others
 - Program limits are plausibly exogenous to current decision making
 - The ratio of the initial premium and the maximum premium therefore serves as an instrument for the difference in premiums between any two years:

$$\ln(PA_{i,t=2}) - \ln(PA_{i,t=1}) = \theta \ln\left(\frac{PA_{i,t=1}}{\text{Max}PA_{i,t=1}}\right) \quad (1)$$

Estimating equation: Farm panel

$$y_{it} = \beta_0 + \tau_t + \gamma_c + \beta_1 \underbrace{P_{it}}_{=\theta \ln\left(\frac{PA_{i,t=1}}{\text{Max}PA_{i,t=1}}\right)} + \beta_2 \mathbf{F}_{it} + \epsilon_{ict} \quad (2)$$

where:

y_{it} is the outcome of interest for farm i in year t

P_{it} is FCI coverage

$\theta \ln\left(\frac{PA_{i,t=1}}{\text{Max}PA_{i,t=1}}\right)$ is IV described previously

F_{it} are controls for time-variant operator characteristics

τ_t are year fixed effects

γ_c are county fixed effects

Debt

Relationship between debt and insurance has been observed in the literature and confirmed here:

- Increase in premiums paid increases farm operation's short term debt

Debt

Relationship between debt and insurance has been observed in the literature and confirmed here:

- Increase in premiums paid increases farm operation's short term debt
- Results driven by increase in outstanding (rather than repaid) debt

Debt

Relationship between debt and insurance has been observed in the literature and confirmed here:

- Increase in premiums paid increases farm operation's short term debt
- Results driven by increase in outstanding (rather than repaid) debt
- Effect concentrated among operations that are:
 - Less leveraged than average
 - Have higher DRCU than average
 - Have operators that are older

Where does the money go? Results on investment

No impact on long term debt (real estate) but investment in capital does increase:

Where does the money go? Results on investment

No impact on long term debt (real estate) but investment in capital does increase:

- Increase in annual spending on:
 - Non-tractor farm machinery (\$2,700*)
 - Attachments for farm machinery (\$1,700*)

Where does the money go? Results on investment

No impact on long term debt (real estate) but investment in capital does increase:

- Increase in annual spending on:
 - Non-tractor farm machinery (\$2,700*)
 - Attachments for farm machinery (\$1,700*)
- Increase in market value of farm machinery (\$40,000***)

Is this equipment labor-saving? Labor allocations

Farm households' response to risk management:

Is this equipment labor-saving? Labor allocations

Farm households' response to risk management:

- Operators increase on-farm hours

Is this equipment labor-saving? Labor allocations

Farm households' response to risk management:

- Operators increase on-farm hours
- Spouses and other (business) partners decrease on-farm hours

Is this equipment labor-saving? Labor allocations

Farm households' response to risk management:

- Operators increase on-farm hours
- Spouses and other (business) partners decrease on-farm hours
- Net effect: fewer on-farm hours

Discussion

We find:

Discussion

We find:

- Strong relationship between the quantity of short term debt and crop insurance coverage and participation

Discussion

We find:

- Strong relationship between the quantity of short term debt and crop insurance coverage and participation
- Simultaneous increase in investment in equipment, which is less labor-intensive
 - Robustness check using machinery characteristics from Phase2

Discussion

We find:

- Strong relationship between the quantity of short term debt and crop insurance coverage and participation
- Simultaneous increase in investment in equipment, which is less labor-intensive
 - Robustness check using machinery characteristics from Phase2
- Managerial vs. “employee” labor: Advantages to freeing up employee labor

Conclusion

Conclusion

- Reduction in cash flow volatility as internal finance to increase investment in equipment

Conclusion

- Reduction in cash flow volatility as internal finance to increase investment in equipment
- Crop insurance addressed financial frictions associated with operating credit and it freed up working capital for labor saving investments

Conclusion

- Reduction in cash flow volatility as internal finance to increase investment in equipment
- Crop insurance addressed financial frictions associated with operating credit and it freed up working capital for labor saving investments
- Previous research (i.e. Weber et al. (2016)) finds minimal impact of crop insurance on the intensive margin of production, for example chemical expenditure.

Conclusion

- Reduction in cash flow volatility as internal finance to increase investment in equipment
- Crop insurance addressed financial frictions associated with operating credit and it freed up working capital for labor saving investments
- Previous research (i.e. Weber et al. (2016)) finds minimal impact of crop insurance on the intensive margin of production, for example chemical expenditure.
 - Our research suggests alleviation of financial frictions leads to dynamic adjustments in capital/labor use by farm households

Conclusion

- Reduction in cash flow volatility as internal finance to increase investment in equipment
- Crop insurance addressed financial frictions associated with operating credit and it freed up working capital for labor saving investments
- Previous research (i.e. Weber et al. (2016)) finds minimal impact of crop insurance on the intensive margin of production, for example chemical expenditure.
 - Our research suggests alleviation of financial frictions leads to dynamic adjustments in capital/labor use by farm households
 - Farm household behavior and decision making is relevant for analysis of commercial agriculture

Thank you!

Any questions?
