FINANCIAL CHARACTERISTICS OF U.S. FARMS, JANUARY 1, 1987. Agriculture and Rural Economy Division, Economic Research Service, U.S. Department of Agriculture. Agriculture Information Bulletin No. 525.

#### ABSTRACT

Farm income reached a record high in 1986, but financial stress in some segments of the farm sector continued. Land values, particularly on cash grain and livestock farms in the Midwest, continued to fall. However, conditions are apparently improving for these operations and for the lenders supplying them credit, mainly due to record-high Government support and lower production expenses.

KEYWORDS: Assets, balance sheet, cash flow, debt, Farm Costs and Returns Survey, financial stress, region, sales class, type of farm, financial characteristics.

#### PREFACE

This analysis was prepared by Jim Johnson, Mitch Morehart, Liz Nielsen, David Banker, and Jim Ryan of the Agriculture and Rural Economy Division. The authors wish to thank David Harrington for his review and helpful comments. We especially want to thank Adrie Custer for editorial guidance and Kay Gurick for all of her work in preparing the text. For further information, call Mitch Morehart at (202) 786-1801 or Jim Johnson at (202) 786-1800.

#### SALES INFORMATION

Additional copies of this report can be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Order by title and stock number (001-019-00538-6). Write to the above address for price information, or call the GPO order desk at (202) 783-3238. You may charge your purchase by telephone to your VISA, MasterCard, Choice, or GPO Deposit Account. Bulk discounts available. Foreign customers, please add 25 percent extra for postage.

Microfiche copies (\$6.50 each plus \$3 for processing) can be purchased from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. Order by title and series number (AIB-525). Enclose a check or money order payable to NTIS. Call NTIS at (703) 487-4650 and charge your purchase to your VISA, MasterCard, American Express, or NTIS Deposit Account. NTIS will RUSH your order within 24 hours for an extra \$10; call 800-336-4700.

#### SUMMARY

Farm sector income and cash flow in 1986 rose substantially over 1985 levels due largely to lower costs of agricultural inputs and higher Government support payments. Preliminary estimates put 1986 net farm income in the \$38-billion range, up from the \$32 billion earned in 1985. Farm debt declined in 1986, but farm asset values, particularly land values, continued to fall, although at a slower pace than in previous years.

The 1986 farm sector financial profile reflects mostly improved liquidity (capability to meet payments as they come due during the year), profitability (net farm income), and solvency (ability to pay all legal debts). These improvements signal that the farm economy may be recovering after several years of relatively low commodity prices, declining farm exports, plunging farmland values, and high debt loads. In 1986, most farmers earned enough to meet principal and interest payments, reduce debt outstanding, and meet other financial commitments. However, continued foreclosures and debt restructuring by lenders indicate that not all farmers are sharing equally in the recovery.

Data from the 1986 Farm Costs and Returns Survey (FCRS) indicate that earnings varied widely by farm size, type, and location. Over 82 percent of all farms with sales greater than \$100,000 generated positive net cash farm income, compared with 23 percent of farms with sales less than \$10,000. Dairy, poultry, and nursery and greenhouse operations reported the lowest percentage of operations with negative farm business income, measured by both net cash farm income and net farm income. The Northern Plains, Corn Belt, and Lake States had the lowest percentage of farms with negative net cash farm income.

Nearly 39 percent of all farms entered 1987 debt free, and another 39 percent had debt/asset ratios less than 0.40, indicating that debt was less than 40 percent of assets. Both figures were about the same on January 1, 1986. The relative debt position of farmers (debt/asset ratio), on average, dropped slightly (0.224 to 0.218) from January 1, 1985, to January 1, 1986. At the beginning of both 1986 and 1987, 21 percent of farms had debt/asset ratios greater than 0.40. The percentage of outstanding debt held by these highly leveraged farms remained stable at about 66 percent of all debt. The percentage of total debt owed by technically insolvent farms (debt/asset ratios greater than 1.0) dropped from 16 percent in 1985 to less than 14 percent in 1986. The highest debt/asset ratios were among farms with sales greater than \$250,000, cash grain farms, and farms in the Lake States and Northern Plains.

A more complete assessment of financial performance can be obtained by jointly considering income and leverage measures. Farm operations were classified by one of four income/solvency positions for each income measure: favorable, marginal income, marginal solvency, and vulnerable (see summary figure). The choice of which income measure to use is based on one's interests, such as household versus business performance or long-term versus short-term performance. Each combination gives a somewhat different assessment. For example, the net farm income measure results in 57 percent of farms falling in a favorable financial position, net cash household income results in 47 percent, and net cash farm income results in 41 percent. But all income measures place about 151,000 (10 percent of the survey estimate of number of farm operations) farms in a vulnerable financial position in 1986, compared with 155,000 in 1985.

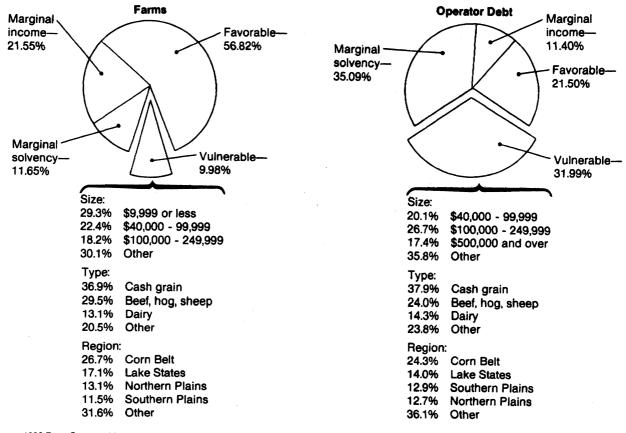

The 1986 FCRS gives an expanded number of survey farms of 1.57 million, compared with the official estimate of 2.2 million farms. Differences between farm number estimates from these two sources are accounted for primarily by farms with sales of less than \$10,000. For 1986, the FCRS gives an estimate of the number of farms with sales over \$40,000 that is 95 percent of the official number of farms.

Farmers have transmitted their financial stress to lenders through inadequate security for loans and reduced earnings due to delinquencies and loan losses. The distribution of lender-held debt, by leverage position of borrowers, suggests that most lenders' portfolios are still at risk. Although the proportion of debt held by technically insolvent farms fell in 1986, debt owed by farms with debt/asset ratios of 0.40-1.0 increased from 50 percent to 53 percent of all debt.

Lenders generally appear to be imposing credit restraints on their borrowers, as further land value declines have reduced the loan value of farmland as security. Loan defaults and writeoffs are contributing to the drop in debt levels, and limited credit availability is encouraging farmers to reduce debt and limit capital spending.

# Financial Characteristics of U.S. Farms January 1, 1987

#### INTRODUCTION

The financial profile of the farm sector has changed dramatically during the past 15 years. Farm asset and debt levels rose to record highs in the late 1970's, outpacing gains in income and cash flow. In contrast, the 1980's have seen falling asset values and, more recently, a rapid drop in the level of farm debt outstanding. Record-high use of Government commodity programs to support farm income and a concerted effort by farmers to reduce expenses has pushed sector income and cash flow to alltime highs.

Adjustments in asset values, debt levels, and income and expense flows have affected both farmers and lenders. Some highly efficient farmers with little debt burden have maintained strong returns and a relatively sound financial position, despite losing net worth as asset values have eroded. Many highly leveraged farmers have had low returns and insufficient cash flow to service debt. Farmers' income generating and debt repayment capabilities vary widely and are not solely a function of leverage. Farm lenders have also encountered financial performance difficulties as farm stress translates into reduced or inadequate security for loans and reduced earnings caused by delinquencies and loan losses.

This report presents the latest information on the financial performance of farm operators. We develop a profile of farm businesses' net income, cash flow, liabilities, assets, and returns on investment to help identify and document the diversity in farm financial conditions by size of business, commodity specialization, and area of the country. Data for this report were obtained from the U.S. Department of Agriculture's Farm Costs and Returns Survey (FCRS) conducted by the National Agricultural Statistics Service (NASS) in February and March of 1987 for the 1986 calendar year.

### FINANCIAL PROFILE OF THE FARM SECTOR

Estimates of the farm sector's income statement and balance sheet provide a perspective on the aggregate earnings and financial position of the farm sector. These financial tools also provide a foundation for understanding the diversity in the capital structure of farm businesses, the ability of farm businesses to generate enough cash to meet their financial obligations, and the returns earned by assets used in the production of agricultural commodities.

#### Trends in Farm Income

Nominal net incomes have recovered from the low levels earned during 1977-83 to levels that may well exceed record earnings during 1973-75 (table 1). Data for 1986 and 1987 are based on earning prospects for individual commodities, production expenses, and Government programs. These prospects suggest that in 1986 both net cash income (a measure of farm business liquidity) and net farm income (a measure of profitability) increased substantially from their 1985 levels in real terms, and reached record highs in nominal terms. Furthermore, forecasts for 1987 indicate that net farm income may again rise in both nominal and real terms despite a continued drop in market receipts.

Income in 1986 as well as its outlook for 1987 depends heavily on Government loan and direct payment programs and on changes in production expenses. Direct Government payments rose to nearly \$12 billion in 1986 and could well exceed \$15 billion in 1987. Meanwhile, production expenses are expected to continue the contraction that began in 1985. Both factors are important. In 1986, the drop in expenses exceeded the drop in cash receipts by nearly \$4 billion, while Government payments increased by \$4 billion. If the 1987 forecast holds, expenses will have declined by nearly 19 percent or \$27 billion in the last 3 years. The drop in expenses and the increase in payments should push expected real net incomes well above their early 1980's levels.

#### Changes in Assets and Debts

Total farm asset values stood at \$696 billion on December 31, 1986, compared with \$754 billion a year earlier (table 2). The drop was primarily a result of declining real estate values, which dropped 12 percent in 1985 and another 8 percent in 1986. The largest decline in land values was in the Delta and Lake States while values increased in the Northeast and decreased by smaller percentage amounts than a year earlier in the Corn Belt and Northern Plains.

|                   |       |            |                |         |

r = revised. P = preliminary. F = forecast.  $\underline{1}$  Excludes household dwellings.  $\underline{2}$  Includes CCC storage and drying loans.

Nonreal estate asset values also fell by about 8 percent in 1986 with most of the decline in the value of stored crops and the value of machinery and equipment on farms.

Farm debt fell by over \$18 billion in 1986, a substantial increase over the pace of annual debt reductions in 1984 and 1985. Debt outstanding dropped at the end of 1986 despite a \$3-billion growth in outstanding Commodity Credit Corporation (CCC) crop loans. Outstanding real estate and nonreal estate debt categories declined. The drop in real estate debt may reflect lender writedowns and writeoffs of nonperforming loans, lower land values, and fewer credit-financed land purchases. The drop in nonreal estate debt reflects fewer planted acres of major crops, lower input prices, and reduced capital expenditures. Government payments and marketing certificates also reduced the need for operating loans.

The sector's total net worth fell to about \$538 billion in 1986, the lowest nominal dollar level of owner equity since 1970, largely due to the drop in land values because real estate accounts for nearly 75 percent of total farm asset values. However, the major increases in the ratios of debt to net worth and debt to assets in each year since 1979 were reversed in 1986. Large reductions in the level of debt outstanding in 1986 left the ratios of debt to net worth and debt to assets below those for 1985 despite the continued drop in land values.

In another major reversal of the 1980's trend to date, owner equity may well increase in 1987. This increase could result from relative stability in both real estate and nonreal estate asset values and a further reduction in the level of debt outstanding. In contrast to 1986, debt outstanding to the CCC may contribute nearly a third of the total drop in debt, largely because of farmers using commodity payment-in-kind certificates to redeem crop loans. If these 1987 forecasts hold, the farm sector's debt burden may ease for the first time in this decade.

#### Trends in Returns and Cash Flow

Recent changes in the sector's income and balance sheet have substantially altered both the returns earned by assets and equity and the ability to service debt out of current earnings. When measured before interest payments, and in constant dollars, cash flow is down from the peak years of the 1970's but has remained above pre-peak levels (table 3). Farmers with little or no debt saw their real returns rise during the 1970's, and currently remain above pre-peak levels. A rise in the level of debt outstanding and an increase in real interest rates dramatically raised interest expenses from the early 1970's through 1980-84. Thus, cash flow after interest for 1980-84 was not only below levels earned during the peak years of the 1970's, but was also below the level earned in the pre-boom years of 1970-71.

In 1985 and 1986, cash flow after debt service resembled the pre-boom level of earnings. Annual returns to production assets increased 32 percent in 1985 and 10 percent in 1986. The improved earnings combined with the decreased debt to lower the ratios of debt to annual cash flow and debt to annual returns on production assets. In 1985, debt was 6.5 times higher than returns to assets and 3.6 times higher than net cash flow. But, in 1986, the ratio of debt to annual returns to assets dropped to 5.3 and the ratio of debt to net cash flow fell to 3.1. The ratio of debt to returns is in the range of the pre-boom 1960's and 1970's level while the ratio of debt to cash flow remains above the pre-boom level.

The rise in net farm income kept aggregate returns to operators, assets, and equity in 1986 higher than in 1985 (table 4). Continued large Government payments and further declines in production expenses may help aggregate returns to assets and equity increase again in 1987. The rate of return to assets rose from 3.7 percent in 1985 to 4.7 percent in 1986, because of the fall in asset and equity values in 1986. This rate should rise further in 1987 as aggregate returns to assets continue to increase. Returns to equity have been negative in some years of the 1980's, reflecting the sector's large interest commitment. In 1986, aggregate return to equity likely exceeded pre-boom levels for the first time since the boom years of 1972-74. Rates of return to equity from current income are now above levels earned during the 1950's and 1960's, because of the substantial reduction in farm sector net worth.

While the sector's rate of return should continue to improve in 1987, the ratio of debt to net cash flow and ratio of debt to return on assets remain at relatively high levels, although both are now declining to the more traditional levels earned during the 1960's. This drop indicates that farmers likely had more breathing room for debt service and other cash commitments in 1986, than they did a few years ago. However, farmers with above average debt levels will continue to have difficulty servicing their debt from current income.

Aggregate financial data demonstrate that real incomes for the entire farm sector are larger now than they have been at any time in the last decade, rates of return have increased to levels earned early in 1970's, and the drop in asset and equity values has slowed. This situation raises questions that require individual farm business data: What proportion of farmers are now facing financial difficulties? What are their production and financial characteristics? What share of debt and assets do they hold? To which lenders is their debt owed? And, what portion of this debt may be at risk of loss?

4

#### FINANCIAL MEASURES

Information required to analyze the financial performance of farm businesses can be derived from the farm's income and cash flow statement and its balance sheet. These tools provide the basis for monitoring the solvency, liquidity, and profit positions of the farm business. By considering other sources of farm family income and family living allowances, they also permit analyses of the income position of the farm household. In this report, solvency, liquidity, and profitability are used as follows:

Solvency. The farm's capital structure, which shows the relationship between the levels of assets and debt. The relationship between assets and debt indicates whether the sale of all assets would generate enough cash to pay off all debt.

r = revised. P = Preliminary. F = forecast. 1/ Average as of December 31 of current year and December 31 of previous year.

Liquidity. The farm's cash flow position, which determines whether or not a farm business (or household) can generate enough cash to meet financial obligations.

**Profitability**. A measure of the value of agricultural production, indicating whether the farm generates enough gross revenue from all sources each year to fully cover all costs associated with production, including depreciation of the farm's capital.

Farm Operator Cash Flow and Net Income Statement

The combined cash flow and net income statement in this report is organized to show the proportion of farm businesses and farm households that generate enough cash to meet various levels of financial obligations. Included in these statements are:

Net cash farm income (NCFI) after payment of all cash expenses including interest. This calculation indicates whether the farm is meeting all cash business expenses out of gross cash earnings of the business. NCFI gives a current or short-term perspective on the earnings position of the business since it does not account for capital used in production. This income measure is also conceptually equivalent to the net cash income estimate developed for the entire sector. It indicates whether farmers are covering all cash costs, including payment of interest charges, out of gross cash earnings and shows the cash available to meet family consumption, taxes, and other expenses.

Net farm income (NFI). This is a longer term measure of earnings since it is the difference between gross farm income (the sum of gross cash income, nonmoney income items such as the onfarm consumption of fruits, vegetables, and meats, and the change in crop and livestock inventories) and total expenses (all cash expenses plus depreciation). Net farm income indicates the level of profit or loss associated with a current year's production. Over time, this measure of income indicates the ability of the farm to survive as a viable business unit.

Net cash household income (NCHI). This component of the combined income and cash flow statement provides a household perspective by combining cash earnings from nonfarm sources with the cash available from the business after payment of all commitments including debt service. The cash available after family living expenses is estimated by subtracting an estimate of nonmetropolitan cash living requirements.

We developed estimates for family living expenses and principal payments from secondary information. The family living expense estimate is the nonmetro household mean money income (\$22,383 for 1985) less estimated Federal income tax (\$2,243), State income tax (\$356), and an estimated implicit net rental value of farm dwellings (\$4,567). After these adjustments, the family living allowance was estimated at \$15,200 for the average farm family in 1985. The estimated living allowance for 1986 (\$15,500) equals the 1985 allowance adjusted for changes in the annual Consumer Price Index (CPI) (approximately 2 percent). Principal payments were estimated by lender based on the amount of real estate and nonreal estate debt held by farm operators for each lender. The principal repayment commitments we used are consistent with real estate debt repayment in the 10th year of a 30-year schedule, nonreal estate debt repayment in the 3rd year of a 7-year schedule, and interest rates charged by each lender for each debt category. The estimated percentage of outstanding debt repaid varied by lender. Specific principal repayment levels calculated for use in the analysis were: Federal land banks, 1.21 percent, life insurance companies, 1.36, Farmers Home Administration, 8.92, commercial banks, 9.91; individual and others, 5.93, and Production Credit Associations, 12.42 percent. These figures indicate that lenders with a larger proportion of their total portfolio in real estate have smaller repayment percentages. To calculate the total principal repayment amount for each farm, the above percentages were applied to the amount of outstanding liabilities reported for each lender, and amounts were summed across all lenders.

# Farm Operator Balance Sheet

The farm operator balance sheets we used were developed directly from farmers' responses to survey questions. Assets include the farm operator's estimate of current market value for land and buildings owned; the estimated market value of the operator's dwelling if located on the farm or ranch; the farm share of all trucks, tractors, all farm machinery, equipment, tools, and automobiles; livestock and poultry; all crops stored on- or off-farm valued at current market prices; all purchased seed, feed, fertilizer, chemicals, fuel, and other inputs on hand; and an estimate of the market value of any other assets of the farm business such as savings accounts, stocks, or bonds.

Farm debt was reported by operators as debt owed on January 1, 1987, that was related to the agricultural operations of their farm or ranch. Debt was defined to include all farm business obligations, and survey enumerators were instructed not to collect debt for nonfarm purposes. Debt outstanding was reported by lender rather than by purpose. The categories of lenders included the Commodity Credit Corporation, Production Credit Associations, Federal land banks, Farmers Home Administration, commercial banks and savings and loan associations, life insurance companies, merchants, dealers, cooperatives, individuals who sold farmland, and other lenders (see app. fig. 2).

# Farm Operator Returns

Farm operator returns to assets and returns to equity combine aspects of both the income statement and balance sheet to measure farm business profitability. An estimate of the cost of operator management and labor is required to estimate these measures so that they are consistent with sector accounts. The charge for operator management was estimated to be 5 percent of the value of total calendar year crop and livestock sales plus Government payments plus net change in the value of inventories minus purchased feed and livestock expense. We determined the charge to operator labor by multiplying the number of weeks worked during the year reported in the FCRS by the average hours worked per week reported in the FCRS to estimate annual labor hours. We then multiplied annual labor hours by annual average State operator wage rates for all hired workers in 1986 reported by NASS. Rates of return to assets were then calculated by subtracting the operator management and labor charges from net farm income plus interest and dividing by total asset value. Returns to equity were calculated by subtracting interest charges from the total return to assets and dividing by net worth.

# Farm Business and Household Income and Solvency Positions

Relying on one measure of financial performance to assess the current financial performance or the future economic viability of a farm operation can

be misleading. The debt/asset ratio is a poor indicator of financial stress because it reveals little about the income generating potential of an operation. For example, a high leverage ratio is acceptable when the return on assets exceeds the costs of debt capital.

The framework for evaluating individual farm financial health is based on combined income and solvency positions (see Appendix I). What follows is a description of the financial situation faced by operations which were classified as favorable, marginal income, marginal solvency, or vulnerable farms as a result of employing these criteria.

#### Favorable: Favorable Solvency and Positive Earnings

Farm businesses and households with debt/asset ratios of 0.40 or less are considered to be in a favorable solvency position. Farms are more likely to be in this position if the operation's assets (particularly land) have not declined substantially, the unit was not purchased with substantial debt financing and has not been refinanced or offered as security for other indebtedness, and profits have been used to reduce outstanding debt. What follows is a description of the characteristics of farms in favorable solvency and income positions.

Positive net cash farm income. Farms in this income position are in favorable shortrun liquidity positions. The operation is generating adequate income to cover all business expenses other than debt repayment. However, this positive income measure may cloud longer term difficulties if it is achieved through inventory reduction or inadequate capital replacement. Also, a full-time family farm's positive net cash farm income may be insufficient to provide an adequate standard of living. Their low debt/asset ratios suggest that these operations have the option of borrowing to meet cash shortages.

Positive net farm income. Farms in this earnings class are in more favorable longer term profitability positions. Adjusted cash income reflects possible inventory accumulation, and depreciation accounts for the proportion of the productive life of the capital stock consumed during the calendar year. Larger farms will generally have positive net farm incomes only if the net cash farm income is positive. That is, for larger units, depreciation will likely be large relative to inventory increases or nonmoney adjustments. In contrast, part-time and smaller units may have negative net cash farm income (due to low volume of sales) but positive net farm income (due to nonmonetary income components, particularly the imputed rental value of the operator's dwelling and the value of home consumption of farm products). Farms with positive net farm income may not be generating adequate earnings to meet family living expenses and debt repayment obligations.

Positive net cash household income. Farms with positive household income are generating sufficient income from farm and nonfarm sources to meet all current financial obligations, including family living expenses and debt repayment. The combination of positive household income and relatively low debt/asset ratios suggests that farm households in this classification are in a good shortrun liquidity position.

# Marginal Income: Favorable Solvency and Negative Earnings

Farms with low leverage levels are probably feeling little pressure from their lenders to restructure debt or reorganize crop and livestock mixes. However, they may be facing an earnings problem as they are unable to generate sufficient income to meet all obligations. Farms in marginal liquidity positions have favorable solvency levels, but have negative income as calculated by the various measures.

Negative net cash farm income. Farms in this negative income position have a short-term business liquidity problem. The farm is not generating sufficient income to cover its operating expenses. Larger units may have negative net cash farm income due to inventory accumulation for future expanded production. While full-time farm families cannot sustain negative cash income indefinitely, units that do not rely solely on agricultural production for income may be able to. Many of these smaller farms may have negative net cash farm income, but positive net farm income (with the addition of nonmoney items) and positive net cash household income (with the addition of off-farm income). Regardless of the cause, negative net cash farm income may increase financial problems if it forces a substantial reduction in savings or an increase in indebtedness.

Negative net farm income. Farms in this income position have operated at a loss during the year. For many larger operations, depreciation and inventory changes will give these farms positive net cash farm income, but negative net farm income. Commercial farms with favorable solvency positions, but negative net farm income need to evaluate operational changes to correct this situation. Negative net farm income is sustainable only through eroded savings or increased borrowing. Smaller units may have an improved net farm income (relative to net cash farm income) due to nonmoney income additions. Those who rely on off-farm income may experience little financial stress despite a relatively poor performance by their farm business.

Negative net cash household income. The financial situation of farms with negative net cash household incomes generally eroded during the year, even though the low leverage position indicates that financial difficulties are shortrun liquidity problems. Commercial operations may be forced to borrow, since their off-farm income sources are inadequate to cover operating losses. Smaller farms may have positive nonmoney income to offset their negative cash household incomes.

#### Marginal Solvency: High Leverage and Positive Income

Highly leveraged operations face greater risks and potential losses than do farms with less leverage. A higher debt/asset ratio suggests that the operation has fewer unencumbered assets to offer as security for short-term loans to meet cash shortfalls. Farms with positive current income can use these earnings to reduce debt and decrease debt service expenses, improving their potential for positive incomes. However, debt reduction does not guarantee an improved solvency position in the future, since relatively larger declines in asset values may result in a less favorable ratio of debts to assets, even after debt levels have been reduced. This scenario has hurt the solvency position, and thus financial risk-bearing ability, of many farm operations in those regions where farm real estate values dropped substantially during the 1980's. Those who generate positive earnings can reduce outstanding debt.

Positive net cash farm income. Farms in this shortrun favorable liquidity position are generating sufficient income to cover operating expenses, including interest paid on debt. The farm family may have to temporarily reduce their standard of living as available funds are used to reduce outstanding debt. Capital replacement may not be adequate for continued profitability. Larger units may be generating positive cash earnings through dependence on Government commodity programs. Smaller units in this high leverage, positive net cash farm income position tend to rely on agricultural production as the primary income source. Unfavorable production or market conditions, even if limited in duration, could reduce the viability of all operations in this position.

Positive net farm income. Farms in this more favorable longer term profitability position may find servicing existing debt a burden if price or production levels decline. However, they are generating adequate earnings when nonmonetary income adjustments are made to maintain current capital stocks. As with farms in favorable solvency positions, larger units will generally earn positive net farm income only if net cash farm income is positive. Smaller operations may again find that the value of nonmoney items exceeds depreciation, resulting in a positive net farm income, but a negative net cash farm income. Current business management decisions would probably use positive earnings to reduce outstanding debt, rather than to expand or replace capital.

Positive net cash household income. Farms with adequate income from all sources to meet operating expenses, debt service, and family living expenses will probably take advantage of this favorable liquidity situation to reduce debt and improve their solvency position. Larger units for whom net cash household income is the only positive earnings measure (that is, negative NCFI and negative NFI) are relying on off-farm income (excluding the nonmoney adjustment) to meet current expenses.

### Vulnerable: High Leverage and Negative Income

Highly leveraged operations that generate insufficient earnings to meet current financial obligations are in vulnerable liquidity and solvency positions. Farms with high debt/asset ratios have a relatively smaller proportion of equity that can be converted to cash by increasing debt. Lenders are reluctant to approve such equity conversions for highly leveraged operations when real estate values are continuing to decline (although at a slower pace), particularly when those operations are not earning enough to meet current cash expenses. For farms in this dually vulnerable position, the form in which assets (and the equity) are held is as important as the magnitude of those asset (and equity) levels. Farms with a high proportion of assets held as cash, crop, and livestock inventories, and other current assets will have readier access to cash to meet shortfalls than those with primarily fixed (real estate) assets. Farms with negative earnings and primarily fixed assets, can only generate cash by converting equity, thereby increasing indebtedness.

Limited additional distinction can be made for highly leveraged farms with negative earnings by all income measures. Those with negative net cash farm income have not met current operating expenses, even though they may have reduced inventories in an attempt to do so. Negative earnings reported by net farm income and net household income suggest that even when nonmoney income items and off-farm income are considered, income is inadequate to meet financial obligations.

Farms classified as vulnerable will continue to face limited credit availability. Increasing earnings may require reducing operating expenses, restructuring enterprise combinations, and delaying capital expenditures. Partial or complete asset liquidation ultimately may be necessary.

# FARM OPERATOR BUSINESS AND HOUSEHOLD INCOME

In 1986, a larger proportion of farmers were able to meet cash commitments out of current cash earnings than in 1985. In addition, almost 70 percent of operators had profitable operations in 1986, as measured by net farm income. Improvements were not consistent across all leverage categories, however. This section looks at the distribution of net cash income to gauge the cash flow position of farm operators along with net farm income to ascertain the profitability of their operations.

The share of farms with negative NCHI decreased from 44.7 percent in 1985 to 41.4 percent in 1986 (app. table 24). For those with debt/asset ratios between 0.01 and 0.70, this percentage dropped 5-7 points during 1986. Likewise, the figure dropped from 66 to 62 percent for insolvent farms. Farms with no debt showed a small increase, however, possibly reflecting that group's decrease in off-farm income.

NCFI had a different pattern, with nonindebted farmers showing an improvement in that cash flow measure. Also, average cash flow of operators with midrange debt/asset ratios (0.11-0.40) declined slightly during 1986. The overall improvement in NCFI from 1985 to 1986 (48.3 to 46.9 percent with negative values) was smaller than the improvement in NCHI. The difference was probably due to the overall rise in nonfarm income, which strengthened NCHI.

The trend of improved cash flow is consistent with aggregate sector income estimates. In 1986, reduced farm production expenses and increases in Government payments strengthened agriculture's cash flow position. The data suggest, however, that debt repayment put a drag on cash flow in 1986. The share of all farms with a negative cash flow which excludes principal and interest payments was 12 percent lower than the share of all farms with a negative cash flow after principal and interest deductions (40 and 52 percent, respectively). Average interest payments decreased by \$1,200 between 1985 and 1986, however.

Overall, the longer term financial picture looked better in 1986 than the shorter term perspective (despite a heavy drawdown of inventories), with 32 percent of all farms having a negative NFI. This percentage increased as the debt/asset ratio rose.

#### Sales Class

The percentages of farms with negative cash flows (farm and household) decreased as farm size (as measured by gross sales) increased. Although the same relationship held true between profitability and farm size, the differences were less pronounced (app. table 25). Average nonfarm income was highest in the lowest two sales classes (below \$20,000) and in the top class (\$500,000 and above). The latter group also showed the highest growth in nonfarm income during the year (63 percent), while nonfarm income decreased by 22 percent for farms with sales between \$40,000 and \$99,999.

The improvement in business cash earnings was spread across all sizes of farms, with the largest relative increase being for smaller farms with sales

less than \$40,000. Nevertheless, only 37 percent of these smaller farms had a positive net cash income in 1986. The discussion of farm characteristics in Appendix II provides a perspective for understanding the farm earnings of these smaller operations. A large share of the operators of these farms are part-time farmers and have a primary job other than farming.

Over 80 percent of farms with sales above \$40,000 had a positive net cash income in 1986, compared with 78 percent in 1985. The improvement in the share of commercial farms with positive net cash income is traceable to reduced operating and interest expenses, particularly for the largest farms, and to increased Government payments. Midsized operations apparently gained most from the increase in payments, probably because of the relative concentration of grain production on these farms.

Farm cash flow was higher than household cash flow except for farms with sales below \$10,000, as measured by the percentages of farms with negative NCFI and NCHI, with the differences being greatest for sales categories with low average nonfarm incomes. For farms with sales below \$10,000, the difference was significant: The percentage of farms with negative NCFI was 77 percent, compared with 46 percent with negative NCHI. This difference might be due to a large average off-farm income (\$30,719) and small estimated debt repayments, both of which helped to boost NCHI.

Based upon our analysis of income-based measures of financial performance, larger farms appear to be better off than smaller farms from both a short- and long-range perspective. Also, the cash flow positions of larger farm businesses appear to be healthier than either the longrun profitability of large farms or the shortrun cash flow positions of large farm households.

# Farm Type

From both a cash flow and a profitability perspective, poultry, followed by nursery and greenhouse operations, appeared to have the strongest financial performance in 1986. At the other end were other livestock; other crop; beef, hog, and sheep; and vegetable, fruit, and nut farms, all of which had relatively large percentages of farms with negative measures of cash flow and net farm income. The data indicated, however, that a strength (weakness) in cash flow did not necessarily correspond to a strength (weakness) in NFI within a farm class.

Other livestock farms had the highest percentage (76.9 percent) of operators with negative NCFI, primarily because these farms had the lowest average gross cash farm income (\$33,324) of any farm type. Poultry and dairy farms had the lowest percentage of farms with negative NCFI (25.6 percent and 17.0 percent, respectively).

Vegetable, fruit, and nut, and other livestock farms had the highest average off-farm income (\$43,280 and \$41,566). Poultry farms had the highest average NCHI (\$120,670), and nursery and greenhouse farms had the next highest average NCHI at \$54,820. Tobacco and cotton farms had the largest share of farm households with negative NCHI (52.9 percent), and poultry farms had the lowest share (18.1 percent).

Profitability appeared to be better than cash flow in five types of farms: tobacco and cotton; vegetable, fruit, and nut; nursery and greenhouse; other crop; and beef, hog, and sheep. Of these, the share of farms with negative NFI was lower than the share with negative NCFI or NCHI. On the other hand, NCFI was the strongest measure of financial performance for cash grain and dairy farms. Net cash household income was weaker than any other measure for tobacco, cotton, and dairy farms.

Other livestock farms had the largest share of farms with negative NFI (46.6 percent). The three farm types with the smallest share were nursery and greenhouse (11.2 percent), poultry (16.9 percent), and dairy (21.8 percent).

#### Region

The Northern Plains and the Lake States showed strength in all three measures of financial performance. The Mountain, Delta, and Southern Plains region were relatively weak by these measures, while the remaining regions had mixed results.

The Southern Plains had the largest percentage of farm businesses with negative NCFI (67.6 percent), followed by the Southeast (63.3 percent), and the Delta (62.4 percent). The Northern Plains had the lowest percentage of farms with negative NCFI (26.2 percent) followed by the Corn Belt (35.9 percent).

Average off-farm income was highest in the Pacific region (\$43,767) followed by the Southern Plains (\$35,095). Appalachia had the largest percentage of farms with a negative NCHI (49.4 percent); the Pacific region had the lowest (33.6 percent).

The share of farms with a negative NFI indicates that farms in the Southern Plains have the weakest long-term financial prospects of all regions (44.9 percent). Farms in the Appalachian region appear to have the strongest position (20.9 percent). In the majority of the regions, the percentage of farms with a negative financial indicator was lower for NFI than for NCFI or NCHI. In the Southern Plains and Pacific regions, the percentage of farms with a negative NCHI was close to or lower than the other measures. These statistics were supported by relatively high values of nonfarm incomes which strengthened NCHI values.

### Age and Occupational Specialty

Farm operators between 35 and 44 years of age had the highest percentage of farms with negative NCFI (50.6 percent). Farmers between 55 and 64 years of age had the lowest percentage (42 percent). Farm operators between 35 and 54 years had the lowest percentage of farms with negative NCHI (approximately 33 percent). Farm operators over 65 had the largest percentage of farms with negative NCHI, over 61 percent. They also had the lowest level of average off-farm income (\$15,481).

For operators older than 55, the share of farms with negative NFI was significantly smaller than the share of farms with negative NCFI or NCHI, indicating a greater degree of longrun financial stability than shortrun liquidity. On the other hand, for operators between the ages of 35 and 54, the share of operators with negative NFI slightly exceeded the share with negative NCHI, but the percentage with negative NCFI exceeded the percentage with negative NCHI by 17 points. High interest payments in these age groups reduced the levels of NCHI and NCFI (and increased the percentage with negative values), but high levels of nonfarm income helped to boost NCHI. Farm operators who indicated that their primary occupation was farming had the best NFI and farm business cash flow positions. Hired managers had the highest share of negative NCHI and NFI (over 50 percent each), although operators who indicated their primary occupation to be "other" (part-time farmers) had the largest percentage with negative NCFI. Average nonfarm income was highest for operators with other primary occupations (\$43,861), followed by hired managers (\$28,734), and those who are primarily farmers (\$12,763).

# FARM OPERATOR ASSETS AND DEBTS

Farm operators held assets valued at \$452 billion and debts totaling \$98.5 billion on January 1, 1987, giving an average debt/asset ratio of 0.218. Operators held about \$504 billion in assets and \$113 billion in debt at the end of 1985, giving an average debt/asset ratio of 0.224. On average, the relative debt positions of farm operators decreased by a small amount. Note that asset values are estimated and represent the judgment of farmers and ranchers as to the value of their holdings.

Thirty-nine percent of farm operators had no debt (the same as at the end of 1985), about 4 percent were insolvent, and 22 percent had debts greater than 40 percent of assets.

At the end of 1986, 3.7 percent of farms were technically insolvent (debt/asset ratios above 1.0) compared with 4 percent a year earlier. The amount of debt held by these farms declined from 16.1 percent in 1985 to the current figure of 13.9 percent. Thus, the survey suggests that while the portion of farm operators with low- to moderate-debt levels remained almost identical between 1985 and 1986, the share of farmers and debt in the more highly leveraged positions changed considerably. Both the share of insolvent operators and the debt held by these farmers dropped, possibly because of operators leaving the farm sector or because of highly leveraged farms reducing their debt burden.

As a group, farm operators had estimated average assets of \$300,378 and debts of \$65,396. The estimated market value of land and buildings accounted for 67 percent of total assets reported by farmers and ranchers, farm equipment accounted for 14.7 percent, livestock for 9.4 percent, crops for 4 percent, and purchased inputs and other assets for about 3.6 percent.

Total assets dropped by about \$52 billion during 1986, over 10 percent. Land and buildings were responsible for the majority of the decrease, totaling over \$51 billion (a 15-percent decline). The value of equipment declined by 12 percent, an indication that farmers are delaying capital equipment purchases and are not covering depreciation. Total livestock inventories increased slightly, while crops stored on the farm decreased by 24 percent. The latter statistic could signal financial stress if inventories are being drawn down to maintain a positive cash flow. Purchased inputs and other assets increased sharply, which may be a response to lower input prices.

Overall, farms with debts in excess of 70 percent of assets reported a smaller level of average assets per farm than did farms with lower debt/asset ratios (excluding farms with no debt). The share of land and buildings in total assets decreased as degree of leverage increased. Average net worth was also inversely related to the debt/asset ratio, ranging from \$233,942 for farms with no debt to -\$85,527 for insolvent farms. Farms with no debt held the

14

largest proportion of assets (30 percent). On the other hand, insolvent farms, which held 14 percent of the debt, held only 2 percent of the assets. The composition of lenders also changed somewhat by debt/asset level, with the Farm Credit System increasingly relied upon as the ratio increased.

# Sales Class

The estimated net worth of farm operators averaged \$234,982 on January 1, 1987, but ranged from a low of \$129,000 for farms with less than \$10,000 in sales to over \$1.4 million for farms with sales in excess of \$500,000. This strong positive relationship between net worth and size of farm is historically consistent.

Land and buildings decreased as a share of total assets as farm size increased, declining from 80 percent of assets on farms with sales less than \$10,000 to 57 percent of assets on farms with sales over \$500,000 (the figures were 85 and 65 percent on January 1, 1986). For farms with sales of less than \$10,000, land, equipment, and livestock accounted for 95 percent of total assets, compared with 85 percent for farms with sales of over \$500,000. Crop, livestock, and other assets were more important to the asset structure of commercial-size farms than to smaller farms.

Sources of debt also varied by sales class of farm. Farms with sales of less than \$20,000 obtained a larger share of debt from banks than all farms as a group, and less from the Farm Credit System. Farms in the sales classes that fall between \$20,000 and \$500,000 have the largest portion of debt (40-50 percent) held by the Farm Credit System. Outstanding debt of farms in the largest sales category (over \$500,000) is nearly equally divided between the Farm Credit System, commercial banks, and other sources of funds, with the latter leading at 38 percent.

While the average debt/asset ratio for all farm operators was 0.22, average debt/asset ratios ranged from 0.10 for the smallest farmers to 0.31 for all farms with sales over \$250,000. Within the higher sales categories (sales of \$40,000 and above) the greatest proportion of assets was owned by farmers with debt/asset ratios from 0.11 to 0.40. In all of the lower sales classes (below \$40,000), on the other hand, the greatest share of the assets was owned by farmers with no debt. However, in all sales classes, except below \$10,000, farmers with debt/asset ratios between 0.41 and 0.70 held the largest percentage of debt.

### Farm Type

Vegetable, fruit, and nut farms and dairy farms reported the highest levels of assets per farm in 1986. Vegetable, fruit, and nut farms had the largest average net worth of any farm type (\$333,000). Cash grain producers followed by dairy and poultry producers, vegetable, fruit, and nut farms, and tobacco and cotton farms reported the highest average debt/asset ratios. Nursery, greenhouse, and livestock operations (beef, hogs, sheep, and other) reported the lowest average debt/asset ratios.

The structure of the asset base of farms varied considerably by type of farm. Land and buildings accounted for about 75 percent of total farm assets for vegetable, fruit, and nut growers, nurseries and greenhouses, and poultry operations. Land and buildings accounted for around 70 percent of the assets of beef, hog, sheep, tobacco, cotton, and other crop farms. Land and buildings were relatively less important to dairy, other livestock, and cash grain farms, although this item remained the single largest component of total assets. Machinery, equipment, and the estimated value of the dairy herd accounted for about 36 percent of dairy farm assets. Livestock inventories accounted for 12 percent of all assets on beef, hog, and sheep farms, 19 percent on dairy farms, 8 percent on poultry farms, and 25 percent on other livestock farms.

### Region

Farmers in the Mountain and Pacific regions reported the highest average level of farm assets and net worth. The lowest average level of assets were reported by farmers in Appalachia, a result consistent with the generally smaller farms found in that region. However, the average net worth of farmers was lowest in the Lake States, followed by the Corn Belt, the Delta States, and the Appalachian region.

Farmers in the Northern Plains, Lake States, and Corn Belt reported the lowest land and building values as a component of total assets (55-60 percent of total assets), possibly due in part to the drop in land values in these regions, as well as the nature of the enterprises. Farmers in these three regions had heavier investments in farm equipment as a component of total assets than did other regions.

The debt/asset ratio varied considerably among regions, with the lowest levels recorded in the Appalachian region (0.11) and the Northeast (0.12). The Lake States, Northern Plains, and Corn Belt had the highest ratios (0.32, 0.30, and 0.26).

# Age and Occupational Specialty

On January 1, 1987, older operators were more financially solvent than their younger counterparts, with debt/asset ratios ranging from 0.08 for farmers over 64 to 0.33 for farmers less than 34 years of age. While 8 percent of farmers under 34 were insolvent, less than 1 percent of farmers over 65 had debt/asset ratios over 1.0. The average value of farm assets increased with age up to age 64 and decreased above that age, probably reflecting older farmers' liquidation of assets and/or transfer of property to younger family members. Farmers between the ages of 35 and 54 had the highest average debt levels (\$87,000-\$90,000) followed by farmers younger than 35 (\$71,079).

Operators age 55 to 64 had the greatest average net worth, while those under 34 had the lowest level. Land represented a greater share of total farm assets for older operators than for younger operators (ranging from 74 to 58 percent), while the reverse was true for equipment (with equipment being 20 percent of assets for the youngest farmers but only 11 percent for the oldest). More crop and livestock inventory was held on the farm by younger operators than by older operators at the beginning of 1987.

Farms with hired managers as operators had a higher average debt/asset ratio than either full-time farmers or part-time farmers (0.31, 0.23, and 0.17, respectively). On average, hired managers' operations also had the highest net worth, which reflects the larger size of their operations.

The asset value of operations run by hired managers was estimated to be, on average, three times the asset value of operations run by full-time farmers and six times the asset value of operations run by part-time farmers. On the

other hand, the average debt level of farms with hired managers was 4 times the average debt of full-time farmers' operations and 11 times the average debt of part-time farmers.

Part-time farmers hold a larger portion of their assets in land than do either hired managers or full-time farmers (78 percent compared with around 64 percent). They also hold less crop and livestock inventory on the farm (8 percent versus approximately 15 percent). Full-time farmers, however, have the greatest share of total assets as equipment (16 percent) on their farms, compared with 11 percent for part-time farmers and 8 percent for hired managers.

#### FINANCIAL PERFORMANCE OF INDIVIDUAL FARM OPERATORS

A framework we developed for evaluating the financial performance of farm businesses jointly considers both earnings position and financial leverage (see Appendix I). Furthermore, data from the 1986 Farm Costs and Returns Survey also permit (for the first time) a distinction between net cash income and net farm income which gives a more comprehensive evaluation of a farm's financial situation. The viability of farm households is assessed (as in previous years), using net cash household income measures in combination with the solvency position of the farm business.

In addition to combined income and solvency positions, financial performance of individual farm operators is evaluated by calculating selected financial ratios. Three ratios are discussed in more detail in Appendix I.

#### Net Cash Farm Income and Solvency

In 1986, 41.4 percent of farms were in the most favorable relative short-term financial position having both a positive NCFI and a low to moderate debt level (debt/asset ratios below 0.41), up from 40.4 percent in 1985 (table 5). These farms accounted for 21.6 percent of total operator debt outstanding in 1986, compared with 21.0 percent in 1985. Over 55 percent of farms with sales above \$40,000 were in this favorable income/solvency position, while only 33 percent of the remaining small farms (sales of \$40,000 or less) qualified. Farms with sales over \$40,000 accounted for about 50 percent of all farms in a favorable financial position.

Marginal farm businesses, those whose financial position is most susceptible to changes in their business environment, may be characterized either by positive earnings and high debt levels or by negative earnings and low to moderate debt levels (debt/asset ratio below 0.41). Considering net cash income and solvency, 48.7 percent of farms surveyed were in this position in 1986 compared with 49.7 percent in 1985. The majority of this change in distribution is due to the decline in the percentage of farms with negative NCFI and low debt levels (38.3 in 1985 to 37 in 1986). Of these marginal farms with solvency problems, 80 percent had sales above \$40,000, while those with cash flow difficulties were predominantly smaller operations (sales of \$40,000 or less).

From a net cash income/solvency perspective, 9.9 percent of farm businesses were in the most vulnerable financial position in 1986. Although nearly identical to the 10 percent of such farms in 1985, within this group of farms the proportion with debt/asset ratios above 1.0 declined from 2.14 to 1.74

# Table 5--Farm businesses: Net cash income position and debt situation by liquidity/solvency class and debt/asset ratio

|                                                                               |      |                             |          |            |                              | De     | bt,      | as                      | 3e'              | t n           | ati                          | 0         |          |                              |                  |            |                              |            |                              |

percent. In 1986, the group of farms classified as vulnerable held 25.1 percent (\$24.7 billion) of total operator debt compared with 26.4 percent (\$29.9 billion) a year earlier. Sixty-six percent of these farms had sales of less than \$40,000.

#### Sales Class

The percentage distribution of farm operators by earnings (using NCFI) and solvency position within sales class categories for both 1985 and 1986 suggest a direct relationship between increased sales and improved financial performance with the exception of the smallest sales class in 1985 (fig. 1). Another distinct relationship involving sales class pertains to farms in marginal income/solvency positions. A greater proportion of commercial-size farm businesses with marginal financial performance experienced solvency problems than did farms with sales below \$40,000.

Income problems were more prelevant for the smaller farm operations. This is consistent with the tendency of larger farms both to use debt more frequently and to carry higher debt/asset positions when they do borrow. The percentage of farms in the most vulnerable income/solvency position declined for sales categories above \$100,000 between 1985 and 1986. The percentage of farms in a marginal financial position increased, primarily for farms with positive earnings and a highly leveraged financial position. This group could include highly leveraged farms with favorable income in 1986 and farms with positive income moving to a higher debt/asset position as their asset values continue to erode. The financial situation of farms with sales between \$20,000 and \$99,999 remained generally unchanged between 1985 and 1986; slightly more were in a favorable situation but the same number remained vulnerable. Operations

#### Figure 1

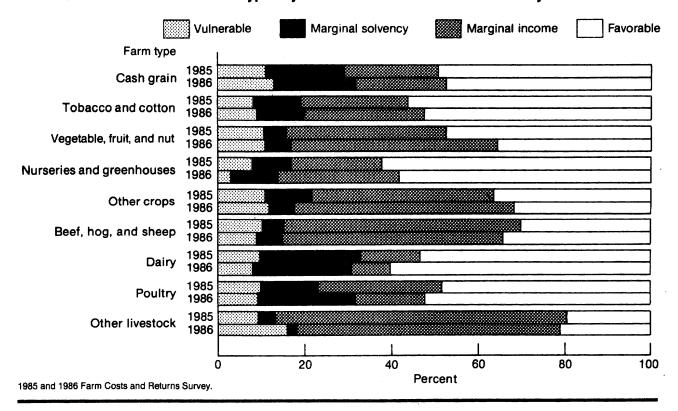

Distribution of Farms Within Sales Classes by Net Cash Farm Income and Solvency Position

with sales between \$10,000 and \$19,999 had both a lower proportion of farms in the worst relative financial position in 1986 and more in a favorable position.

#### Farm Type

The percentage of farms with negative cash income increased for all crop farms, except for nurseries and greenhouses, and decreased for all livestock farm types except for "other livestock" (fig. 2). Thus, with the exception of nursery and greenhouse operations, the percentage of crop farms in the most vulnerable cash income and solvency position increased between 1985 and 1986. In contrast, all livestock enterprises, with the exception of other livestock, had fewer farm businesses with negative net cash incomes and debt/asset ratios above 0.40 in 1986 than in 1985. In 1986, over 50 percent of tobacco, cotton, and poultry, and 60 percent of nursery and greenhouse and dairy operations were in a favorable income and solvency position. Nearly 50 percent of each of the following farm types was in a marginal position with income a major beef, hog, and sheep; vegetable, fruit, and nut; and "other crop" problem: farms. These farms also had the smallest percentage of farms in a favorable position. Unlike other farm types in a marginal income/solvency position in 1986, 20 percent of dairy and poultry operations indicated more solvency difficulties than income problems. The cash grain category also had nearly 20 percent of farms with positive cash flow but high debt in 1986. Overall, the other livestock farm category had the largest percentage of farms in a vulnerable position in 1986 followed by cash grain and other crop farms. The cash grain and other crop farm categories also had the largest percentage of farms in a vulnerable position in 1985.

#### Figure 2

Distribution of Farms Within Farm Types by Net Cash Farm Income and Solvency Position

# Region

Comparing the net cash farm income and solvency distribution of farms within regions for 1985 and 1986 reveals improved financial conditions in the Lake States, Northern Plains, Delta, and Mountain regions (fig. 3). The Northeast and Appalachia had the fewest farms in a vulnerable position in both 1985 and 1986. The Northern Plains had more marginal farm businesses with a solvency problem rather than income difficulties. The Corn Belt and Lake States also had a large share of farms in this marginal financial position. These observations are consistent with the improved earnings but continued erosion of asset values in these regions. The percentage of farms in a vulnerable position increased in the Southeast and Appalachia and remained steady in the Corn Belt. Over 50 percent of farms in the Corn Belt and Northern Plains were in the most favorable income and solvency position in 1986.

#### Net Farm Income and Solvency

Evaluation of farm business earnings based on net farm income reveals that 68 percent of farms were profitable in 1986 (table 6). The remaining 32 percent of farm businesses operated at a net loss when earnings were adjusted for depreciation, changes in inventory, and nonmoney income. Thirty-three percent of farms with sales less than \$40,000 had negative net farm incomes, while only 28 percent of farms with sales above \$40,000 were in this position. These data indicate that changes in inventory and other nonmoney income items more than offset the charges for depreciation of machinery, equipment, and other farm capital, leaving a higher percentage of farms in a positive income situation. The most improvement in the percentage of farms with positive

income was for small farms with sales below \$40,000. These farms have both relatively small amounts of depreciation and a large share of total farm earnings from noncash sources. Commercial-size farm operations increased their share of farms with negative net incomes. These farms likely had large depreciation charges and perhaps sales from inventory.

The relationship between net cash farm income and net farm income is presented in table 7. Of the 475,000 farms with negative NFI, 90,000 or 19 percent had positive NCFI. These farms may have either serviced their immediate cash needs by selling inventories or had insufficient cash to fully compensate for the farm's depreciating capital stock. In contrast, 31 percent of farm businesses with positive NFI did not cover cash operating expenses (including interest) out of current sales. Some farms in this position may have decided to postpone crop and livestock sales and build inventories in anticipation of more favorable prices, to feed out livestock, or for other purposes. These farms would have had a more favorable net income than cash flow. Over 48 percent of farms with sales less than \$40,000 were in this position. These farms accounted for the vast majority of farms that moved from a negative net cash income to a positive net farm income in 1986. This demonstrates the dependence of small farm operators on noncash items such as home consumption as a source of business earnings.

Using net farm income to measure earnings showed that 57 percent of farms were in the most favorable long-term or income/solvency position. These farms were holding about 22 percent of total debt owed by operators in 1986. Using net farm income as the earnings measure instead of farm net cash income affected

Table 7--Farm businesses: Net farm income position and net cash income position

1986 Farm Costs and Returns Survey

23

farms with sales of \$40,000 or less the most, raising the proportion of farms with positive earnings and low debt from 33 percent to 61 percent.

When NFI is used to measure earnings, 33 percent of farm businesses were in a marginal income/solvency position. Nearly 46 percent of farms with sales above \$500,000 were in this marginal financial situation, about the same as in a favorable situation. Within the group of marginal farms, 35 percent had solvency problems. The remaining 65 percent faced business losses in 1986. This group consisted predominantly (74 percent) of small noncommercial operations.

Ten percent of farms were in the most vulnerable income/solvency position in 1986. Moreover, large farm operations accounted for a greater proportion of farms in this situation (47.7 percent of farms), compared with the NCFI earnings measure (33.2 percent). This occurs because the charges for depreciation on larger commercial farms is more than the offsetting changes in noncash income such as inventory and home consumption of food products. Farms classified as vulnerable using the income/solvency criteria accounted for 32 percent of total debt outstanding as of January 1, 1987, compared with the 25 percent of debt held by farms classified as vulnerable using the cash income/solvency measure. This increase in debt held by operators classified as vulnerable results from more commercial-size farms falling into the vulnerable category under the net income measure. Commercial-size farms owed 66 percent of the debt in a vulnerable situation using the cash income criteria and 75 percent using net income.

### Sales Class

Net farm income as a measure of earnings produces a different perspective than the cash income/solvency measure regarding the relative financial conditions of farms within sales classes (table 8). Sales classes with the largest percentage of farms in a vulnerable financial position, using the net income/solvency criteria, were those between \$40,000 and \$499,000. Both larger and smaller sales classes had a smaller percentage of farms in a vulnerable position. The relationship between earnings and solvency still held for the farms in the marginal financial performance category when the net income/solvency criteria is used in place of the cash income/solvency

Table 8--Distribution of farm operators within sales classes by net farm income and solvency position

measure. Farms with sales over \$40,000 still appeared to have more problem with their debt position than their income capability. Moreover, nearly 60 percent of farm businesses with sales below \$40,000 had positive net farm incomes and low debt levels in 1986; 50 percent of farms with sales between \$40,000 and \$250,000 also fell into this position.

### Farm Type

When earnings are measured by net farm income, only other livestock operations had fewer than 50 percent of farm businesses in the most favorable financial position (table 9). Moreover, one in six cash grain farms was classified as vulnerable under this criteria, the highest of any farm type, because cash grain farms not only have a relatively large depreciation charge, due to their machinery investment, but also because they drew down inventories in 1986. Both of these adjustments would contribute to more cash grain farms having a negative net farm income.

### Region

The distribution of farms with negative net farm income and debt/asset ratios above 0.40 ranged from 5 percent in Appalachia to 14 percent in the Lake States (table 10). The Lake States, Northern Plains, and Corn Belt had the largest shares of farms both in a vulnerable position and with positive net income but high debt loads in 1986. Over 50 percent of farms were in a favorable net income and solvency position in all regions except for the Southern Plains and the Mountain region.

# Net Cash Household Income and Solvency

Estimates of farm households with positive or negative NCHI were developed by adjusting net cash farm income to reflect off-farm income, estimated principal repayments, and estimated family living allowances. Over 47.4 percent of farm households were in a favorable income/solvency position in 1986 compared with 44.4 percent in 1985 (table 11). Of these farms, 62 percent had sales of less than \$40,000. Forty-eight percent of all farms with sales above \$500,000 were in this income/solvency position in 1986. Forty-two percent of farms

Table 9--Distribution of farm operators within farm types by net farm income and solvency position

were in a marginal financial position. Of this group, 43 percent had no debt and negative NCHI and were predominantly small farm operations (sales less than \$40,000). Only 27 percent of marginal farm households reported solvency difficulties, while the remaining 73 percent could not meet family living, debt service, and operating expenses out of current farm and nonfarm income. As expected, farms with high debt tended to be economically larger than farm households with cash flow problems. Marginal farm households accounted for 42 percent of total operator debt outstanding as of January 1, 1987.

In 1986, 10.5 percent of farm households were in a vulnerable position (negative net cash incomes and debt/asset ratios above 0.40) compared with 11.2 percent in 1985. Twenty-four percent of these vulnerable farm households were technically insolvent in 1985. This figure declined to 21 percent in 1986. The percentage of operator debt held by farms classified as vulnerable also declined from 36 to 35 percent. About 40 percent of farm households in a vulnerable income/solvency position had sales of less than \$40,000 in both 1985 and 1986.

# Sales Class

The percentage of farm households in a vulnerable position declined between 1985 and 1986 for farms in the \$500,000 and over, \$100,000 to \$249,999, and \$10,000 to \$19,999 sales classes, and was unchanged for the remaining sales categories (fig. 4). Still, nearly one in six farm households associated with farms in the \$40,000 to \$499,999 sales range were in a vulnerable position. The relationship between economic size and the distribution of marginal farm households was similar to that for farm businesses. That is, larger farm households (sales above \$40,000) had more debt-related problems while smaller households had trouble generating cash flow. In 1986, over 50 percent of farms with sales between \$100,000 and \$499,999 had positive NCFI and debt/asset ratios below 0.40, which put them in the favorable classification.

#### Farm Type

Cash grain, tobacco and cotton, and dairy were the only farm types with more than 10 percent of households in a vulnerable position (negative cash

# Table 11--Farm households: Net cash income position and debt situation by liquidity/solvency class and debt/asset ratio

income and debt/asset ratios above 0.40) in 1986 (fig. 5). The percentage of farm households in a vulnerable income/solvency position rose between 1985 and 1986 for cash grain, tobacco and cotton, and nursery and greenhouse operations, but declined for all major types of livestock farms.

In both 1985 and 1986, tobacco and cotton farms had the smallest proportion of households in a favorable income/solvency position (39 and 38 percent), while nursery and greenhouse operations had the largest percentage of households in this position (65 and 61 percent). Farm types, other than poultry, in a marginal household income and solvency position in 1986 tended to have more cash flow difficulties than solvency problems.

# Region

The regional distribution of farm households by income/solvency position is given in figure 6. In both 1985 and 1986, the Northern Plains and Lake States had the largest proportion of farms in a vulnerable position (negative NCHI and debt/asset ratio above 0.40). The Northern Plains also had a larger share of farm households in a vulnerable position than farm businesses. This reflects both the relatively large debt commitment of farms in this region and smaller amounts of off-farm income. Farm households located in the Northeast and Pacific regions had the highest percentage of farms in a favorable income/solvency position.

Over 30 percent of marginal farm households had solvency problems in the Lake States and Northern Plains, while in other regions marginal farms tended to have more difficulty meeting cash demands.

#### Financial Ratios

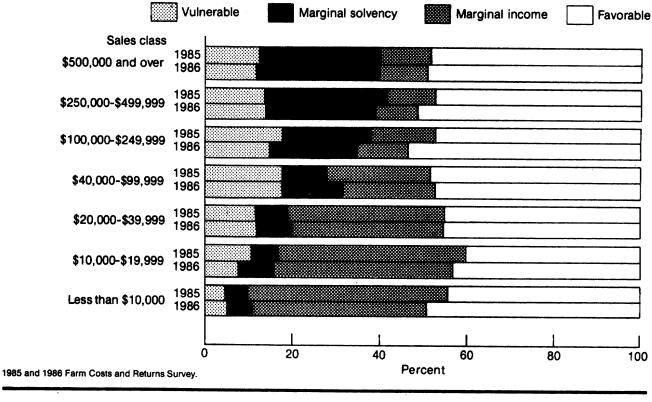

Selected ratios which provide alternative measures of liquidity, solvency, profitability, and financial efficiency are estimated for various classifications of farms. These ratios are defined in detail in Appendix I along with a guide to interpretation. Although limited by the lack of acceptable standards, ratio analysis provides a relative basis for which to compare the financial position of farms.

# Income and Solvency Classifications

Averages of the liquidity, solvency, profitability, and efficiency ratios are given for each of the four income and solvency classifications in table 12. Only the set of financial ratios for farms classified in a vulnerable, marginal, or favorable position based on a debt/asset ratio in excess of 0.40 and a negative net cash income are discussed here. Comparable data for the net farm and net cash household income/solvency classifications are given in appendix tables 12 and 13. Ratio analysis provides additional information about the financial structure of farm businesses classified in vulnerable, marginal, or favorable financial positions.

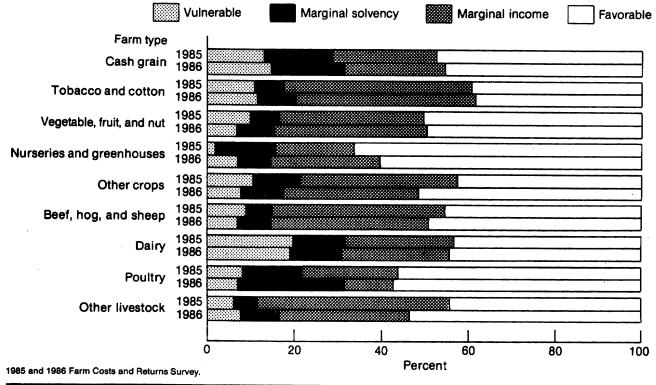

Farms classified as vulnerable based on their combined income (negative) and solvency position (debt/asset ratio over 0.40) had a debt service coverage capability well below that for farms classified either as marginal or favorable and below that of all farms as a group. Vulnerable farm businesses, on average, fell short of covering each \$1.00 of interest and estimated principal repayments by -\$0.14. In contrast, farm businesses classified in a favorable position had \$6.16 cash availability per \$1.00 of debt service, and

# Distribution of Farms Within Sales Classes by Net Cash Household Income and Solvency Position

# Figure 5

# Distribution of Farms Within Farm Types by Net Cash Household Income and Solvency Position

farms classified in a marginal income position due to cash shortfalls had a business debt service coverage ratio of -1.76. Vulnerable farms had an average debt service commitment that took 48 cents out of each \$1.00 of gross cash income. And, given the relationship between cash expenses and income as measured by the gross ratio, vulnerable farm businesses, on average, did not generate enough cash to meet all financial obligations.

Differences between farm businesses in a vulnerable position and those either in a favorable position or in a marginal solvency position illustrate the role that control of production expenses and ability to generate earnings plays in the viability of the farm business. Farms classified in a marginal solvency position have debt/asset ratios, on average, identical to that of farms classified as vulnerable (0.69). Yet, these marginal farms generated \$2.16 to cover each \$1.00 of debt service from their farm business alone. When household debt service was considered, \$1.65 was generated. The profitability and efficiency ratios show that farms in a marginal solvency position cleared 29 cents out of each \$1.00 of gross cash farm income above total cash expenses and had the highest rate of return on assets. This ability to generate returns likely kept these highly leveraged farm businesses abreast of their cash commitments. But, the financial ratios also suggest that if costs were to rise in relation to revenues or if returns were to drop due to changes in production, prices, or other reasons, farms in the marginal solvency class could move into a more difficult financial situation. Farms in the favorable classification had a small amount of debt relative to assets (9 percent), had a small interest commitment relative to total expenses (4 percent), and generated relatively strong returns to assets.

# Sales Class

Ratio values calculated from the 1986 FCRS data are presented by sales class and for all farms in appendix table 14. Each component of financial performance (liquidity, solvency, profitability, and financial efficiency) was generally directly related to economic size. The data specifically suggest that as economic size increased the relative financial strength of farm operations improved in 1986.

Average ratio values estimated for all farms surveyed for the three liquidity measures were 2.41 for the household debt service coverage ratio, 1.97 for the business debt service coverage ratio, and 0.15 for the debt servicing ratio. Differences between values of the debt service coverage ratios reflect the importance of nonfarm income to smaller farm operators (sales less than \$40,000) who accounted for 64 percent of farms surveyed in 1986. The debt service coverage ratios also revealed that without nonfarm income, farms with sales below \$40,000 would have been illiquid in 1986. Considering the debt servicing ratio across all farms, about 15 percent of gross cash income was required to service debt commitments in 1986.

The average debt/asset ratio was estimated at 0.22 for all farms surveyed in 1986. Farms in sales classes above \$40,000 had debt/asset ratios above the U.S. average. The remaining small farms had average debt/asset ratios below 0.20, demonstrating the smaller amounts of credit use typically associated with smaller operations.

Estimates for the three measures of profitability demonstrated wide disparity across sales classes in 1986. On average, farm operators in the \$250,000 to \$499,999 sales class were the most profitable by all measures. Average rate

1986 Farm Costs and Returns Survey

#### Figure 6

# Distribution of Farms Within Regions by Net Cash Household Income and Solvency Position

of return on equity was estimated at 0.66 for all farms surveyed and became negative for sales categories below \$100,000. A similar distribution across sales classes occurred for average rate of return on assets with negative values estimated for sales categories below \$20,000. Profit margins above the U.S. average were estimated for farms with sales between \$250,000 to \$499,999, \$20,000 to \$39,999, and less than \$10,000.

On average, the most financially efficient group of farms using the gross ratio measure (total cash operating expenses divided by gross cash income) was farms in the \$250,000 to \$499,999 sales classes who were previously identified as the most profitable. Operating expenses exceeded gross cash income, on average, for farms with sales below \$20,000 in 1986. The average U.S. gross ratio was 0.81 in 1986. Interest expense averaged 6 percent of gross income on the largest farms, increasing to 34 percent for farms in the smallest sales category.

#### Farm Type

Nursery and greenhouse and poultry operations, on average, demonstrated the greatest relative financial strength among farm types in 1986. Other relationships in appendix table 15 suggest that without off-farm income, beef, hog, and sheep, other crop, and other livestock operations would have been illiquid, on average, based on estimates of both debt service coverage ratios. The average debt servicing ratio ranged from an estimate of 0.04 on poultry farms to 0.22 for other livestock farms.

Nursery and greenhouse operations were in the best relative solvency position, with an average debt/asset ratio of 0.09. Cash grain farms, on average, had the highest degree of financial risk associated with their operations in 1986.

By all measures, nursery and greenhouse and poultry farms were the most profitable operations in 1986. Average rate of returns on equity were negative for vegetable, fruit and nut, other crop, beef, hog, and sheep, and other livestock farms, indicating relative financial stress. Other livestock farms had the only negative average rate of return on assets. Average values for the profit margin ratio exceeded 0.20 on tobacco and cotton, nursery and greenhouse, and poultry farms.

Relative to other farm types, operators of nursery and greenhouse and poultry farms were the most efficient. Other livestock farms were the only farm types for which the average gross ratio exceeded 1.0 in 1986. On average, interest expenses were more than 10 percent of gross cash income for cash grain and other livestock farms.

#### Region

Estimates of financial ratios for farm production regions are presented in appendix table 16. The relative financial strength of a region is closely related to the performance of commodity producers presented in the previous section and the relative diversity of commodity production within the region. For example, the strong financial performance in the Delta region in 1986, based on average values of financial ratios, was partly due to the concentration of poultry production in the region.

Average values of debt service coverage ratios indicate that the Appalachian and Southern Plains regions' liquidity position depends on off-farm income. Based on average values of the debt servicing ratio, farms located in the Lake States, Southern Plains, and Mountain regions were in the worst relative liquidity position in 1986.

Average debt/asset ratio values were lowest in the Northeast and Appalachian regions, while farm operations located in the Lake States and Northern Plains demonstrated the greatest relative financial risk.

Average rate of return on equity was negative for the Lake States, Southeast, Southern Plains, and Mountain regions. The Southeast and Southern Plains were the only regions which averaged negative rates of return on assets. Average values of the profit margin ratio indicate that farms in the Delta, Appalachian, and Northeast were most profitable in 1986.

The Delta, Northeast, and Appalachian regions were both most profitable and most efficient based on average values of the gross ratio and the ratio of interest expense to gross cash income. Interest expenses exceeded 10 percent of cash operating expenses, on average, in the Lake States, Mountain, and Southern Plains regions.

#### FARM OPERATOR RETURNS

To gain perspective on the leverage position of farms with differing rates of return and to provide additional insight into the distribution of earnings by farm operators, we cross-tabulated farms by farm business return to equity and debt/asset ratio, and by farm business return to assets and debt/asset ratio. The two combinations of income and solvency indicators are alternative measures of financial performance by which to judge the shortrun and longrun health of particular groups in the farm economy.

Farm operators with a favorable combination of returns and a demonstrated ability to sustain equity and service debt by earning either high returns with relatively high debt or positive returns with little or no debt (equity cushion) are in a fairly secure financial position. Farms with inadequate returns to sustain current equity or to fully service debt over the longer term are in a less stable position and will likely experience financial difficulties unless they are able to increase their returns or reduce their debt service burden.

#### Farm Business Returns to Assets

Because returns to assets do not account for interest payments, they demonstrated little variability across leverage groups (table 13). Over 46 percent of all operators had returns that fell between -5 and 5 percent, and nearly half of those had no debt. Even for highly leveraged groups (except insolvent farms), returns to assets most commonly were between -5 and 5 percent at the end of 1986.

While 25 percent of operations with debt/asset ratios of 0.40 and below had returns of less than -5 percent, 36 percent with debt/asset ratios above 0.40 had returns below that level. Also, farms with higher leverage (0.40 and above) had a higher percentage of farms with returns of 0.05 and above (30 percent) than did farms with lower debt/asset ratios (25 percent).

About 20 percent of all farmers were in the most financially favorable position (debt/asset ratios of 0.40 or less and returns to assets of at least

5 percent). Another 39 percent had low debt/asset ratios and returns to assets between -5 and 5 percent, and 19 percent had low debt/asset ratios but returns less than -5 percent.

Farms with intermediate leverage (in the range of 0.41 to 0.70) constituted 13 percent of all farms in 1986, and higher leveraged farms represented 9 percent of all farms. Farms with medium to high debt/asset ratios (greater than 0.40) and returns of less than -5 percent were about 6.5 percent of the operations.

#### Farm Business Returns to Equity

Nearly 21 percent of all farm operators had no debt in combination with a return to equity between -5 and 5 percent in 1986 (table 14), indicating some financial stability in the short run but some problems in sustaining equity in the long run. Except at high leverage levels, returns to equity most commonly ranged from -5 to 5 percent. Overall, 40 percent of farm operators fell into this category.

A greater proportion of highly leveraged farms had a low return to equity than did less indebted farms. While 64 percent of farms with debt/asset ratios greater than 0.40 had returns of less than -5 percent in 1986, only 30 percent of farms with lower debt/asset ratios had returns below that level. These figures suggest that debt is reducing the returns of some highly leveraged farms.

Eighteen percent of farms in 1986 were in the most financially favorable positions, with both low debt/asset ratios (0.40 and below) and high returns (greater than 5 percent). Some farms appeared to be earning adequate returns on their equity in 1986 despite high leverage. About 4 percent of all operators had debt/asset ratios between 0.41 and 0.70 coupled with returns to equity over 5 percent, while 2 percent had debt/asset ratios over 0.71 and returns above 5 percent. The groups in the most difficult financial position, medium to high leverage and very low returns, constituted 14 percent of all farm operators in 1986.

Table 13--Distribution of U.S. farms by debt/asset ratio and farm business return to assets, January 1, 1987  $\underline{1}/, \underline{2}/$ 

<u>1</u>/ Farm business return to assets is net farm income minus the estimated return to operator and unpaid labor, minus the estimated return to management plus interest expense divided by total assets. <u>2</u>/ Numbers may not add due to rounding.

#### Return to Equity by Sales Class, Region, and Farm Type

The 40 percent of all operators who had returns to equity between -5 and 5 percent were responsible for only 21 percent of the debt at the end of 1986 but owned nearly half of all assets (table 15). Almost 50 percent of all operators whose equity returns fell within this range earned less than \$10,000 in annual sales. They owned 12 percent of all operators' assets at the end of 1986 but held only 3 percent of the debt. The percentage of farmers who fell into the -5 to 5 percent returns range decreased with size of farms. Larger farms, particularly those with sales of \$100,000 and over tended to have a higher percentage of farms with returns under 5 percent. A greater proportion of large farm operations than small operations had a high return to equity (5 percent or more). Their solvency position was not as positive, however. Larger farm classes had a greater share of total debt than assets.

Farm operators with returns to equity below -5 percent owed over 38 percent of all farm operators' debt, with nearly 75 percent of this debt owed by farms with at least \$40,000 in sales. Farms with debt/asset ratios above 1.0 owed another 14 percent of debt. Eighty-two percent of the debt of insolvent farms was owed by farms with sales of at least \$40,000. Together, farms that were either insolvent or with returns to equity below -5 percent owed 52 percent of farm operator debt and owned 28 percent of assets. While farms with smaller sales (below \$40,000) and low returns (less than -5 percent) constituted a relatively large share of all operators with low returns (67 percent), they held only 26 percent of the debt of operators with low returns and 10 percent of all operators' debt.

Appendix table 17 shows the regional distribution of farm operators, debts, and assets by return on equity. The Corn Belt had not only the greatest share of all insolvent farms (30 percent), but also the largest share of farms with a return on equity of less than -5 percent (23 percent). In that region, nearly 33 percent of farms had returns below -5 percent, and about 5 percent were insolvent. These figures are comparable to percentages for the Lake States, the Northern Plains, and the Delta regions where about 35 percent of

| Farm business return to | Debt/asset ratio |         |                |                 |       |      |             |              |

Table 14--Distribution of U.S. farms by debt/asset ratio and farm business return to equity, January 1, 1987  $\frac{1}{2}$ /

NA = Not applicable.  $\underline{1}$ / Farm business return to equity is net farm income, minus the estimated return to operator and unpaid labor, minus the estimated return to management, divided by total equity.  $\underline{2}$ / Numbers may not add due to rounding.

farms also had returns below -5 percent, and about 4 percent were insolvent at the end of 1986. The Southern Plains and Mountain regions had a greater than average share of farms with low returns to equity (41 and 37 percent) but a lower than average share of insolvent farms (2 and 3 percent).

The Southeast had the greatest share of debt held by operators who were either insolvent or had returns on equity less than -5 percent (69 percent), followed by the Southern Plains (67 percent). Nearly 54 percent of all debt of farms which were either insolvent or had returns below -5 percent was owed in the Lake States, Corn Belt, and Northern Plains. Another 20 percent was owed in the Southeast and Southern Plains.

At the other extreme, the Northern Plains had the greatest share of operators who earned a return on equity of 5 percent or more (31 percent). They controlled 32 percent of the debt in the Northern Plains. Twenty-six percent of operators in the Corn Belt and 25 percent in the Northeast had a return on equity above 5 percent. The lowest returns occurred in the Southern Plains where only 12 percent of the farms had a return on equity of 5 percent or more.

Table 15--Distribution of farm operators, debt, and assets by farm business return to equity and sales class, January 1, 1987  $\frac{1}{2}$ /

<u>1</u>/ Farm business return to equity is net farm income, minus the estimated return to operator and unpaid labor, minus the estimated return to management, divided by total equity. <u>2</u>/ Numbers may not add due to rounding.

Thirty-two percent of all operators with returns of at least 5 percent are classified as beef, hog, and sheep farmers, and 27 percent are cash grain farmers (app. table 18). This percentage reflects the large numbers of operators in these categories. Beef, hog, and sheep farmers also represent 40 percent of all farmers who either had returns below -5 percent or were insolvent, while cash grain farmers represented 25 percent.

The percentage of highly leveraged farms with low returns on equity varied by farm type. Other livestock, dairy, and cash grain farms had the greatest share of farmers with either a return on equity less than -5 percent or debt/asset ratio above 1.0 (47, 41, and 40 percent, respectively). They were followed closely by other crop; tobacco and cotton; vegetable, fruit, and nut; and beef, hog, and sheep farms.

Poultry farmers and nursery and greenhouse operations had the highest share with returns on equity of at least 5 percent (67 and 60 percent, respectively). Only 12 percent of other livestock farms; 17 percent of beef, hog, and sheep farms; and 19 percent of other crop farms had returns on equity of that level.

#### LENDER PERSPECTIVE

This section examines the vulnerability of debt and lenders associated with financially troubled farms. In particular, farms previously identified as being in a vulnerable income/solvency position are distinguished as stressed, while the remaining favorable or marginal farm operations under this criteria are referred to as nonstressed.

#### Debt Distribution by Lender

The FCRS collected farm operator debt by type of lender. Figure 7 displays the distribution of debt held by operators on January 1, 1987, by lender. The total debt held by commercial banks, Federal land banks (FLB's), and the Farmers Home Administration (FmHA) was \$63 billion, in contrast to about \$73 billion on January 1, 1985, and \$80 billion at the beginning of 1985 (app. table 19). Debt held by FLB's and the FmHA decreased by around 20 percent in the last year, while operators' debts held by commercial banks declined only 7 percent.

These lenders (commercial banks, FLB's, and the FmHA) held \$10.2 billion of the debt on farms with debt/asset ratios greater than 1.0. When farms with debt/asset ratios of 0.71 to 1.0 are included, this figure increases to \$22 billion. The total debt held by all lenders on farms with debt/asset ratios of 0.71 or more was nearly \$33 billion. This amount represents a 14-percent decrease from the previous year, which compares with a 12.6-percent decline in the level of debt for farms with debt/asset ratios of 0.70 and below.

The distribution of lender debt by leverage position of the operator reveals that commercial banks, FLB's, and the FmHA held about 64 percent of the total farm debt, compared with 65 percent a year earlier (table 16). About 54 percent of FmHA debt was held on farms with debt/asset ratios greater than 0.71. The comparable figure is 27.6 percent for commercial banks. The FmHA held 31.3 percent of all debt on farms with debt/asset ratios exceeding 1.0. Together, commercial banks, FLB's, and the FmHA held nearly 75 percent of total debt in this category. Of all the debt of highly leveraged operators (debt/asset ratios exceeding 0.40), commercial banks held the largest share (18 percent). FLB's and the FmHA held the second and third largest shares (14 and 12 percent).

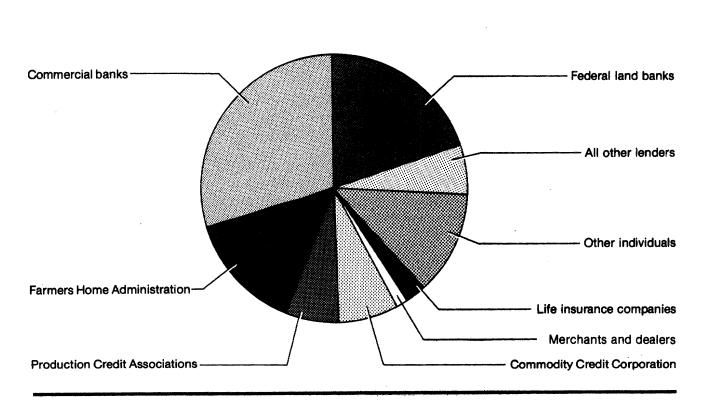

All lenders had at least 59 percent of their reported debt held by highly leveraged farm operators. FmHA had the highest percentage (84 percent), while merchants and dealers had the lowest share. The proportion of operators on farms with debt/asset ratios exceeding 0.70 reporting debt owed to commercial banks, Federal land banks, the FmHA, and Production Credit Associations (PCA) decreased from January 1, 1986, to January 1, 1987, with the exception of farms reporting debt owed to commercial banks with debt/asset ratios of 0.71 to 1.0. This may have resulted in part from a shift from insolvent to solvent status for some farms. The proportion of lender debt owed by insolvent operators also either decreased during this period or remained about the same.

### Distribution of Operator Debt by Measure of Stress

The FCRS data on operator debt was also examined by level of stress. We used three alternative measures based on different indicators of income. A farm was considered to be financially stressed if it had a debt/asset ratio of 0.40 or more and a negative income in 1986. The three measures of income used were net farm income (NFI), net cash farm income (NCFI), and net cash household income (NCHI). Operator debt was first categorized by lender, financial position, and measure of income (app. tables 21 through 23). These data are summarized in table 17 by combining operator debt into stressed and nonstressed categories.

Distribution of Farm Operator Debt by Lender, January 1, 1987

<u>1</u>/ Numbers may not add due to rounding. <u>2</u>/ A stresped farm had a debt/asset ratio greater than 0.40 on January 1, 1987 and experienced negative income in 1986. <u>3</u>/ Own debt is the distribution of operator debt held by a lender between stressed and non-stressed farm operations. <u>4</u>/ All lender debt is the percent of total operator debt on stressed or non-stressed farms held by a lender. <u>5</u>/ All operator debt is the percent of total operator debt held by a stress category. The share of debt held by farm operators in a stressed position depends on the measure of farm and household earnings chosen. If net cash income is selected, 25.1 percent of all operator debt was held by stressed farmers, increasing to 32 percent if net farm income is used, and to 35 percent if net cash household income is used. The share of debt held by stressed operators is directly related to the earnings performance of farms using the various income measures. Net cash income rose in 1986, and fewer farms had negative income compared with 1985. Net farm income reflects net cash earnings adjusted for changes in inventory, depreciation, and other noncash items. A higher percentage of commercial-size farms had a negative net farm income than had net cash income in 1986. These farms also tended to have higher debt than smaller farms. The higher percentage of debt held by stressed farmers based on net farm income is consistent with these facts. The net cash household income measure includes both cash farm and nonfarm earnings and accounts for family living expenses, farm business interest, and principal repayments. A larger percentage of farms had a negative income under this measure than under either of the farm income measures.

Stressed Operator Debt by Lender

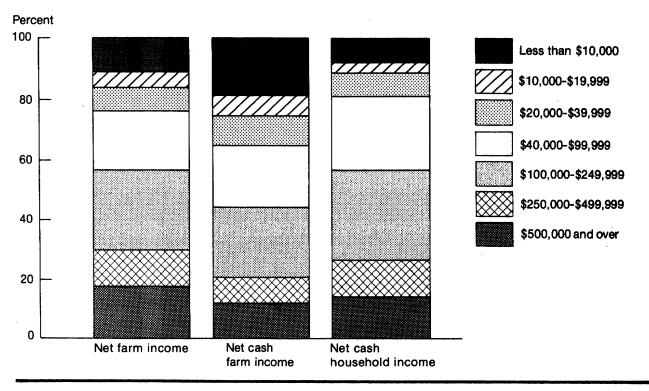

Commercial banks, FLB's, the FmHA, and PCA's held between 70 and 75 percent of the operator debt on stressed farms depending on the measure of income used. As a percentage of total operator debt, this debt varied from 18.9 percent of the total using NCFI to a high of 26.2 percent based on NCHI. The NCHI measure generally gave lenders a lower share of portfolio debt held on stressed farms. The FmHA had the largest shift in the share of debt on stressed farms based on the measure of income. For this lender, the amount of debt classified as belonging to stressed operators increased from 38 percent using NCFI to 55 percent based on NCHI.

Stressed Operator Debt by Sales Class, Region, and Farm Type

The distribution of operator debt on stressed farms was also examined by sales class, type of farm, and region (figs. 8, 9, and 10). Operators with sales of \$40,000 to \$249,999 had the highest share of debt on stressed farms irrespective of the income measure. Based on NFI, over 17 percent of the debt owed by stressed operators was held on farms with sales of \$500,000 or more in 1986. Off-farm income, which is used to supplement the income of smaller farms substantially reduced the amount of debt held on stressed farms when NCHI was used to measure income. For farms with annual sales of less than \$40,000, the share of debt held by stressed operators was 19 percent based on NCHI compared with 35 percent when NCFI was used.

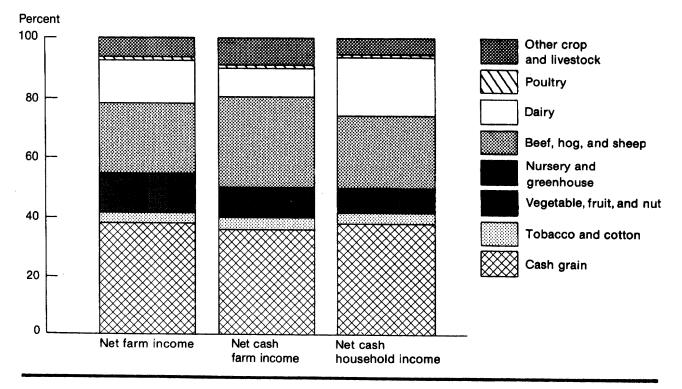

Cash grain farms had the highest proportion of debt held on stressed farms, followed by beef, hog, sheep, and dairy farms. On a regional basis the largest share of stressed operator debt was held on farms in the Corn Belt. This result could be expected given the large number of cash grain farms in this region with sales of \$40,000 to \$249,999. The Lake States, Northern Plains, and the Southern Plains together accounted for between 40 to 44 percent of stressed operator debt depending on the measure of income used.

#### APPENDIX I: ASSESSING FARM FINANCIAL PERFORMANCE

Financial performance of individual farm operations can be assessed by evaluating the relationship between measures of income and relative debt position. Cash-based measures of income reveal the ability of a farm business or household to meet current debt commitments and pay family living expenses. Net farm income is a longer term assessment of earnings potential which indicates the ability of the firm to generate profits.

Solvency as measured by the debt/asset ratio reflects owner equity in the farm business and the financial risk associated with the operation. Past work has illustrated that some farm businesses with very large debt/asset ratios generate enough cash to fully service all commitments while some operations with low debt/asset ratios have either low or negative earnings. Thus, assessing financial performance requires understanding and using a variety of measures.

Several additional measures are available which address elements of financial performance (liquidity, solvency, profitability). These include financial ratios such as debt service coverage, return to assets, and returns to equity. These and other alternative financial indicators along with empirical estimates are presented and discussed for 1986.

#### **Income Measures**

Income generated by farm businesses and households during calendar year 1986, is examined with three measures (app. fig. 1).

Net Cash Farm Income (NCFI). This measure indicates the amount of funds a farm business generates that can be used to pay back principal, expand the farm business, or pay for family consumption or other obligations. We define NCFI as gross cash income minus all operating expenses including interest payments but excluding principal repayment.

Net Cash Household Income (NCHI). This estimate indicates funds available to the farm household after principal repayments and family living needs are met. It can be used for business expansion, further consumption, savings, or other obligations. NCHI is derived by adding family nonfarm income to NCFI and deducting an estimate of principal repayments and a family living allowance.

Net Farm Income (NFI). Net farm income provides a calendar year measure of the net value of agricultural production regardless of disposition and indicates the profit or loss associated with current production. NFI is constructed by adjusting gross cash income to reflect changes in inventory values while incorporating nonmoney income components and subtracting total operating expenses which include both interest and depreciation of capital stock.

#### Solvency Measure

Debt/asset ratios are constructed from survey data to determine the solvency of farm businesses (app. fig. 2). This measure reflects the risk of the farm operator's financial structure or equity of the farm business. Specifically, we measure the debt/asset ratio as total operator debt reported outstanding as of January 1, 1987, divided by the operator's estimate of current market value of all owned assets of the farm business.

#### Income and Solvency Classifications

Income and solvency measures provide the basis for classifying farm businesses and households into one of four categories of financial health for each of the three income measures (net cash farm income, net farm income, and net cash household income). These income measures are constructed for each farm unit, and that farm's relative financial health classification is based on its combined liquidity and solvency status. The farm has a favorable liquidity position if its estimated income measure is positive, and a favorable

#### Appendix figure 1. Farm Operator Cash Flow and Net Income Statement

| CASH FLOW                                                   |                                                                                                                                           |                                                                                                              |  |  |

solvency position if its estimated indebtedness is less than 40 percent of the reported value of all assets expressed as a debt/asset ratio less than 0.40.

Income/solvency categories provide a perspective on the proportion of farm businesses and households that face financial stress from the viewpoint of liquidity and solvency (app. fig. 3). Here's what the farms in each financial health category face:

Favorable. Positive income, debt/asset ratio less than 0.40. These farms, which demonstrate both low to moderate levels of debt and positive returns, are in good short-term financial positions and are considered financially stable. These farms might take advantage of investment and expansion opportunities.

Marginal income. Negative income, debt/asset ratio less than 0.40. These farms/households generally face an earnings problem. Any financial difficulties are more likely related to current business decisions and results (crop mix, weather, program participation, prices paid`and received, output levels, farm size, and efficiency) rather than to the financial riskiness of past decisions. Current earnings deficiencies can be alleviated with increased borrowing or sales of assets, both of which convert equity to cash. The resulting additional debt service burden or decreased equity base could accelerate cash flow problems and increase financial risk.

Marginal solvency. Positive income, debt/asset ratio above 0.40. Farms/households in this category are generating positive returns despite higher debt service requirements. While not experiencing short-term cash income difficulties, they are susceptible to economic changes that would prevent them from meeting existing cash commitments. At current asset values, their equity is insufficient to serve as security for additional borrowing to

| Income                                                                                                                                 | Debt/asset ratio |                    |           |           |                      |          |  |  |  |

Appendix figure 3. Joint Distribution of Farms by Income and Solvency Position

meet shortrun cash needs. Many of these operations may be relying on participation in Government programs to generate current earnings.

Vulnerable. Negative income, debt/asset ratios above 0.40. These farms are both highly leveraged and demonstrate income deficiencies which greatly increase their vulnerability as viable business operations. These operations do not generate sufficient income either to meet current expenses or to reduce existing indebtedness. The highly leveraged positions of these units may be due to declining asset values, increased indebtedness to meet past expansion needs or cash operating shortfalls, or a combination of these factors. Regardless of the evolution of financial circumstances leading to their current highly leveraged position, these farmers may be forced to rely on debt restructuring/forgiveness to continue operating. Even then, cash earnings may not service additional debt.

Farms that are in a favorable position by one income measure will not necessarily be in a favorable position by the other measures. Some measures may understate the financial difficulties of highly leveraged operations to the extent that debt repayment is excluded. The favorable position of one income measure relative to another will depend on the importance of farm production in total family income, and the magnitude of nonmonetary adjustments to income.

#### ALTERNATIVE MEASURES OF FINANCIAL PERFORMANCE

Key aspects of financial performance such as liquidity, solvency, profitability, and financial efficiency can be assessed using some common ratios (app. fig. 4). Ratio analyses, by expressing financial relationships between the income statement and balance sheet in percentage terms, provides a relative basis for monitoring and comparing the financial strength of farm businesses or farm operators. The most limiting constraint for successful use of ratio analysis is the lack of well-established standards for comparison and what constitutes acceptable deviation from these norms. Nevertheless, because ratios summarize information contained in financial statements, they are widely used by both farmers and lenders.

Debt service coverage ratios and debt servicing ratios indicate a farm's ability to repay debt. The farm business debt service coverage ratio is defined as net cash farm income (NCFI) plus interest payments divided by debt service costs (interest expense plus principal repayment). The ratio is also calculated in the same manner for farm households using NCHI. These ratios reveal the ability to service debt out of annual cash income. The debt service ratio is defined as annual principal plus interest payments divided by cash farm receipts. This ratio measures debt burden on the farm business; low values indicate a greater ability to meet debt commitments should cash receipts decline.

The debt/asset ratio is used to measure solvency. Defined as total liabilities divided by total assets, this ratio reflects risk of the operation's financial structure and ability to repay all outstanding debt.

Two measures of returns (rate of return on assets and rate of return on equity) and a profit margin ratio were chosen to assess profitability of the farm business.

#### Definition Interpretation Ratio Liquidity ratios: Net cash household income (NCHI) A value greater than 1.0 indicates that the Household debt farm (considering all sources of income) is plus interest payments divided service coverage liquid. A ratio below 1.0 indicates problems by interest expense plus estimated principal repayments in meeting family living, taxes, and other expenses. A value greater than 1.0 indicates that the Net cash farm income (NCFI) Farm business debt plus interest payments divided farm business (considering only farm earnings) service coverage is liquid. A value greater than 1.0 indicates by interest expenses plus the farm business is making a net positive estimated principal repayments contribution to the household's cash income. Indicates the proportion of gross income **Debt servicing** Estimated principal repayment plus interest expense divided needed to service debt. The ability to by gross cash farm income service debt out of cash income earned by the farm business declines as the value of the ratio increases. Lower values indicate a relative greater ability of the farm business to meet debt service requirements. Differs by farm type, but a ratio above 20 percent could indicate difficulty. Solvency ratios: Used to indicate degree of security of lenders **Total vearend liabilities** Debt/asset and the relative use of owner earnings and divided by total assets of the capital. Higher values indicate greater farm operation financial risk of the farm operation. Values above 1.0 constitute technical insolvency. Farm lenders usually prefer \$2.50 to \$3.00 of assets for each \$1.00 of debt. **Profitability ratios:** Provides a measure of a farm's profits in Net farm income minus the **Return on equity** estimated value of unpaid labor relationship to total farm net worth. The higher the value, the more profitable the and management divided by net current farming operation. A negative worth in farm assets value usually indicates relative financial stress. This ratio is typically between 2 and 5 percent for the farm sector as a whole. Net farm income plus interest Provides a measure of farm profits relative Return on assets to total farm investment. Varies by farm on farm loans minus the type, but the higher the value the more estimated value of unpaid labor profitable the current farming operation is. and management divided by total Return on assets should be 1-2 percent higher farm assets than return on equity. The higher the ratio value, the more Net farm income divided by Profit margin profitable the current farming operation. gross cash farm income Financial efficiency ratios: Provides a measure of the portion of gross Total cash operating expenses Gross ratios farm revenue absorbed by cash production including interest divided by expenses. Varies by type and size of farm, gross cash farm income but the higher the value, the less efficient the farm operator. The higher the value, the more of farm gross Interest-to-gross Total interest expense divided cash income is committed to interest payments. by gross cash income cash income This indicates a relatively fixed expense structure.

### Appendix figure 4. Definition and Interpretation of Financial Ratios

Rate of return on equity equals net farm income minus estimated charges for operator labor and management divided by net worth. This ratio indicates the relationship between net profits and equity of the farm business. A negative return to equity is a relative measure of financial stress, and the absolute size of the ratio roughly measures the rate at which a farm business is adding to or consuming its own capital stock. Rate of return on assets is defined as net farm income plus interest expense minus estimated charges for operator labor and management divided by total assets. This ratio reveals the returns received by the farm operator for both debt and equity capital invested. The profit margin ratio is calculated as net farm income divided by gross cash income and indicates the farm operator's ability to control the level of farm business costs relative to the revenues generated.

Financial efficiency is measured by the gross ratio and by the ratio of interest expense to gross cash income. The gross ratio equals total cash expenses divided by total cash receipts of the farm business. This ratio measures the extent to which the value of production (sold during the calendar year) exceeds annual costs of production. The lower the ratio, the more efficient the farm operation. Interest expense divided by gross cash farm income shows the proportion of cash receipts used for interest payments. This ratio reflects the burden of debt on farm operator's cash flow.

#### APPENDIX II: SAMPLE AND SURVEY RESPONDENT CHARACTERISTICS

Data for this report were obtained from the 1986 Farm Costs and Returns Survey (FCRS) conducted in February and March of 1987 by the National Agricultural Statistics Service (NASS). The FCRS is an integrated survey which combines multiple versions of a questionnaire to simultaneously obtain data for: cash receipts and other sources of farm revenues, production expenses, capital purchases, farm asset and inventory values, liabilities owed to various lenders, and other financial data; specific production practices in sufficient detail to develop enterprise budgets for cost of production analysis; and type of operation and operating characteristics.

The FCRS is a complex multiframe probability-based survey. Since the FCRS is a probability sample, each respondent represents a number of other farms of a similar size and type. Estimates based on a sample differ from data that would have been obtained if a complete enumeration had been taken. These differences result from sampling variability. Variation that occurs by chance because of population sampling can be measured to provide a perspective on the reliability of the data. In addition, survey estimates are always subject to nonsampling errors. Any nonsampling error was minimized by pretesting survey forms, enumerator training, and comprehensive data editing and analysis at both State and national levels.

The sample consists of two frames: a list frame of known operators stratified by economic size and other attributes, and an area frame which consists of all land segments in a State and is stratified by land use type. The area frame contains all land units in the United States, and a probability sample from it would provide unbiased estimates. However, the majority of expenses, receipts, and other economic items are accounted for by a relatively small proportion of farm operators. Thus, it is more efficient to sample these large agricultural producers with a list frame. The area frame accounts for incompleteness in a list frame. The multiple frame sampling approach uses desirable attributes of both frames.

For 1986, the FCRS used six questionnaires to obtain detailed whole farm data for all survey respondents plus enterprise specific data for wheat, soybean, sorghum, sunflower, and sheep producers. One questionnaire was devoted entirely to detailed expenditure and financial items; the remaining five contained aggregate expense and financial data and detailed enterprise production questions for the five types of operations.

There were 24,863 combined list and area frame survey contacts expected for the 1986 FCRS. Contacts among the survey versions were as follows: expenditures, 14,222 farms; wheat; 5,242 farms; soybean, 3,002 farms; sorghum, 699 farms; sunflower, 498 farms; and sheep, 1,200 farms. For the survey, a farm was defined as an establishment that either sold \$1,000 worth of agricultural products or spent at least \$1,000 for feed, supplies, equipment, maintenance or other inputs in producing farm commodities in 1986. A national enumerator training school was held from February 3-6, 1987. This was followed by State-level training schools. Data enumeration began immediately after the State training schools and lasted until March 28, 1987.

#### Operating Characteristics of Survey Respondents

The FCRS data set includes detailed information on financial characteristics, expenses, receipts, resource base, production practices and some limited farm operator characteristics such as age, primary occupation, and nonfarm income. These data not only support more accurate estimates of farm sector income, but also permit a better grasp of distributional attributes of sector participants. This section presents selected economic characteristics of farm operations and farm operators drawn from the 1986 FCRS, and, where appropriate, compares them with other secondary sources.

#### Number of Farms

The 1986 FCRS gives an expanded number of survey farms of 1.57 million farms for 1986 compared with 1.56 million for 1985 (app. table 1). As noted, to qualify as a farm for the FCRS survey, an operation must have sold or purchased at least \$1,000 worth of agricultural products or inputs for agricultural production. In contrast, the USDA officially defines a farm as any place from which \$1,000 or more of agricultural products were sold or normally would have been sold. Most FCRS undercounting of farm numbers is for the small sales classes, especially for farms that had less than \$10,000 in sales. Published and unpublished data from NASS indicate that the FCRS provides an expansion of almost 529,000 fewer farms with sales of less than \$10,000 than the official farm number estimate. Approximately 316,000 of these are farms that would be affected by procedures to assess whether a farm might normally be expected to have \$1,000 of annual sales, a procedure not formally used in this survey.

The 1986 FCRS survey made a first attempt to measure point farms; these data will be evaluated and survey procedures adjusted as needed for future surveys. Resident contacts were asked if they grew any crops or had any livestock on the land they operated during 1986. In addition to the 1.57 million operations that clearly qualified as farms, another 405,000 places had some farming activity. Based on the limited crop and livestock information obtained from these area frame residents, about 120,000 would have qualified as farms under other survey procedures. Meanwhile, the FCRS gives a fairly close count of farms with sales over \$40,000, those generally considered to be commercial-size farm units. For 1986, the FCRS gives an estimate of the number of these size farm units that is 95 percent of the official number of farms published by USDA.

Appendix table i--Estimated number of farms by sales class 1/

 $\underline{1}/$  Numbers may not add due to rounding.  $\underline{2}/$  Farm Costs and Returns survey, USDA.  $\underline{3}/$  USDA., Nat. Agr. Stat. Serv.

The FCRS results on farm numbers show about 13,000 fewer farms on January 1, 1987, than on January 1, 1986. The change in farm numbers differed across sales class with the larger sales classes showing a drop in farm numbers and small sales classes showing a substantial increase.

To examine which of the changes between 1985 and 1986 could be statistically significant, we conducted a t-test to establish where significant changes occurred in the distribution of farms across sales classes (app. table 2). Using the two-tailed, 5-percent confidence cutoff of 1.96, the only significant changes in number of farms were for farms with sales of \$250,000 to \$499,999. Using a less restrictive 10-percent cutoff of 1.65, farm number changes in the \$500,000 or more category and the \$10,000 - \$19,999 category also became significant. This formal test of statistical significance agrees with the more casual observation of absolute changes in farm numbers. Overall, tests showed that the change in the total number of farms was not significant at the 5-percent level.

#### Regional Values of Land and Buildings

The market value of land and buildings is an important part of farmers' balance sheets. In 1985, USDA estimated that real estate accounted for 78 percent of total farm assets. Survey results for real estate market values and transaction prices are given in appendix table 3. For the 1986 FCRS, we asked farm operators to provide an estimate of the current market value of their owned land and buildings (including dwellings located on the farm). In addition to the estimated market value of owned land, farmers were asked if they bought or sold land, and whether the sale was for farm or nonfarm purposes.

Farmers reported an average value of land and buildings, including dwellings, of \$699 per acre. This compares with an average value of \$742 per acre reported in the 1985 survey, a 6-percent drop. Excluding dwellings, the average value was \$565 per acre in 1986, compared with \$602 in 1985. These data indicate that dwellings accounted for 19 percent of the value of land and buildings in 1986. The 1979 Census Farm Finance Survey reported that operator dwellings were equal to 13 percent of the 1979 value of land and buildings.

Appendix table 2--Distribution of expanded numbers of farms by sales class, 1986 and 1985 FCRS  $\underline{1}/$ 

1/ Numbers may not add due to rounding.

#### Farm Types Represented

All major types of farms were represented in the survey. Farms specializing in crop production accounted for 40.1 percent of farms, and livestock producers accounted for 59.9 percent (app. table 4). This represents a continuing increase in the number of livestock farms in existence for the past 3 years and reflects (1) the decrease in crop prices relative to livestock; (2) the large reduction in crop output as a result of crop acreage reduction programs; and (3) the large proportion of crop farm revenue generated by commodity program payments. The drop in the proportion of crop farms between 1985 and 1986 was especially noticeable for cash grain farms. The most common types of farms were beef, hog, and sheep operations (42.5 percent of all farms), and cash grain producers (23.4 percent of farms).

The data given in appendix table 4 also illustrate how farm specialization changes over time when it is based on a sales definition. The shift in farm types between 1985 and 1986 is greatest for cash grain and livestock farms. Farm types characterized by specialized and relatively fixed production technologies such as vegetable farms, nurseries, and poultry operations remained fairly stable between 1984 and 1986.

The most common farm type also varied from one region to another (app. table 5). Cash grain farms, while accounting for 23 percent of farms nationally, were 47 percent of farms in the Northern Plains, 41 percent in the Corn Belt, and 26 percent in the Lake States. Dairy farms were most common in the Northeast and Lake States; field crops in Appalachia; and vegetable, fruit, and nut in the Pacific and Northeast. Beef, hog, and sheep farms accounted for 19 percent or more of farms in all regions, but were especially prominent in the Southern Plains where 69 percent of all farms were classified as one of these farm types, and in the Delta, Southeast, and Mountain States where more than 50 percent were.

#### Distribution of Income and Expenses by Farm Type

The distribution of crop cash receipts between crop and livestock farms in 1986 changed only slightly from 1985. The major change for crop farms was a drop in the share of grain sales on crop farms from 87 to 83 percent and a corresponding rise in the share of grain sales on livestock farms. Livestock receipts were even more heavily concentrated on livestock farms in 1986, increasing from 90.7 percent in 1985 to 93.0 percent in 1986. These changes are consistent with changes in the relative prices of grain and livestock between 1985 and 1986 and the tendency of mixed grain livestock farms to alter their production emphasis based on profit opportunities (app. table 6). Grain, soybeans, and rice account for 78 percent of the crop sales on livestock farms. Enterprises such as cotton, vegetables, fruit, and nut, and nurseries were largely unchanged and have remained relatively constant over time.

In 1986, crop farms received about 71 percent of cash payments from commodity programs, with livestock farms receiving the remainder. Crop farms also received a large majority of the commodity certificates that were issued as partial payment of program benefits. The value of certificates issued for 1986 is reflected in other farm income and explains the big shift in the other farm income category between crop and livestock farms. Government payments are also much more important as a source of gross income to crop farms, accounting for more than 20 percent of gross cash income compared with less than 10 percent for livestock farms.

Just as crop farms accounted for a smaller share of farms in 1986, they also accounted for a smaller share of most production expenses. Crop farms had a smaller share of livestock, seed, fertilizer, customwork, rent, and other expenses commonly associated with mixed grain livestock operations (app. table 7). These farms appear to have become more predominantly livestock-oriented in 1986. Labor and chemical expenses, which are more commonly used in the production of specialty or high-value field crops, were slightly more concentrated on crop farms. As a share of total expenses, rent and general farm business-related were the largest categories of expenses for crop farms; feed and purchased livestock accounted for 45 percent of total expenses on

Selected characteristics of farms and farm operators are given in appendix tables 8, 9, and 10 by farm size, farm type, and region. Average farm size (acres operated) was 498 acres, excluding land rented on an animal unit per month (AUM) basis. This compares with an average farm size of 521 acres reported in the 1985 survey. There were fewer reported owned and share-rented acres in 1986, on average. The largest farms in terms of acreage operated were cash grain at 632 acres and beef, hog, and sheep at 613 acres. If AUM land (which is rented for grazing from the Bureau of Land Management, Forest Service, or other similar agency) were included, beef, hog, and sheep farms would be the largest. On average, 339 acres of AUM land were rented by

NA = Not available.  $\underline{1}$  Numbers may not add due to rounding.  $\underline{2}$  Data for 1985 and 1986 from Farm Costs and Returns Survey, USDA. Data for 1982 from the 1982 Census of Agriculture.

livestock farms. The smallest farms in terms of acreage operated were, by far, nurseries and greenhouses which averaged 24 acres per farm. In contrast to other farm types, nurseries and greenhouses owned almost all their acreage. The largest farms were located in the Mountain States (1,816 acres), Northern Plains (942 acres), and Southern Plains (863 acres). The smallest farms in terms of acreage were in the Northeast and Appalachia.

Total harvested cropland and the types of crops harvested also varied considerably by size of farm, type of operation, and area of the country. For all farms, total harvested acreage per farm was 178 acres, compared with 202 acres in 1985. Harvested acreage increased across sales classes and ranged from a low of 21 acres on farms with less than \$10,000 in sales to 959 acres for farms with sales over \$500,000. Wheat, feed grain, and soybean production was relatively more important as a percentage of harvested acreage on midsize operations with sales ranging from \$40,000 to \$500,000. Cotton and other crops such as fruits and vegetables were more important on farms with sales over \$500,000. Farms with sales of less than \$10,000 had, on average, about 2 acres each of corn and wheat. These small farms tended to produce crops like tobacco or fruit. Grains were the predominant crops on cash grain, dairy, and livestock farms. Cotton was grown almost exclusively on farms specializing in cotton production. Fruits and vegatables were also grown almost entirely by specialized farm operations.

# Appendix table 7--Distribution of income, and expenses in 1986, within farm type $\underline{1}/$

<u>1</u>/ Numbers may not add due to rounding. Source: Farm Costs and Returns Survey, USDA.

The distribution of gross income and expenses mirrored the distribution of harvested acreage, with both increasing by sales class. Average gross income ranged from a low of \$4,479 on farms of less than \$10,000 in sales to over \$1.1 million for farms with sales over \$500,000. Farms with sales of less than \$20,000, on average, reported cash operating expenses in excess of income. This pattern, consistent with earlier years' survey results, indicates that a large portion of this group of farms would have negative net cash incomes. Meanwhile, the average net cash income of farms with sales over \$500,000 was in excess of \$232,000 per farm.

Farms with sales of less than \$20,000 accounted for 52 percent of all farms. This group of smaller farms had 5.2 percent of livestock sales, 4.4 percent of crop sales, and received 3.3 percent of Government payments. The relatively small share of crop sales and program payments obtained by these smaller operations is consistent with their overall harvested acreage and especially their harvested acreage of program commodities such as corn, wheat, and cotton.

Crop and livestock sales were highly concentrated on larger farms. The 1.9 percent of farms with sales over \$500,000 had 27 percent of livestock sales and 35 percent of crop sales. Midsized farms received the largest percentage of Government payments. In addition, wheat and feed grains were more important in terms of crops produced on midsized farms. Crop sales were most highly concentrated on cash grain and vegetable and fruit farms which together accounted for 63 percent of total crop sales. Meanwhile, livestock and dairy operations had over 85 percent of total livestock sales. Nearly 60 percent of Government payments went to the 23 percent of farms classified as grain farms. The Corn Belt had the largest percentage of livestock sales (23), had the second largest percentage of crop sales (20.7), and received the largest percentage of payments (27), which is consistent with the region's focus on grain production. The Pacific region had the largest share of crop sales (21.2 percent), but had only 5.2 percent of payments.

While farms with sales of less than \$20,000 reported, on average, sales and expenses which indicated negative net cash income, these farms had 33 percent of off-farm income earned by farm operators. Other larger farms earned much smaller shares of off-farm income with, for example, the largest 1.9 percent of farms with sales over \$500,000 having 2.6 percent of off-farm income.

Nearly two-thirds of farms with sales of less than \$10,000 did not consider farming their primary occupation. This result is, of course, consistent with the large proportion of off-farm income earned by these farmers. The percentage of operators who considered farming their primary job increased with farm size. Nearly 9 out of 10 operators of farms with sales over \$40,000 considered farming their primary job, with the highest percentage being on farms with sales between \$100,000 and \$250,000. These farmers also reported working the most weeks per year and the most hours per week.

Dairy and grain farms had the highest proportion of operators who declared farming their primary job. Moreover, dairy farmers also reported working the most weeks and the most hours per week. Altogether, dairy producers put in nearly 3,500 hours per year on their farm operations. The Northern Plains reported the largest percentage of full-time farm operators, while the Pacific had the lowest percentage. The Pacific and Southeast reported the fewest number of weeks worked, on average, with the Pacific also having the fewest number of hours worked per week.

Off-farm income was also relatively concentrated on smaller farm operations. Farms with sales of less than \$10,000 had 46.5 percent of total off-farm income in 1985. For 1986, these farms reported 50.4 percent of off-farm income. In another result consistent with 1986, more than 85 percent of farmers with sales over \$40,000 considered farming their primary occupation in 1985 while only 35.8 percent of farmers with sales below \$10,000 did.

The average reported age of operators in 1986 was 51 years, the same as in 1985. The 1979 Census of Farm Finance reported an average farm operator age of 50.5 years. Farmers with sales over \$40,000 tended to be younger than average while operators of smaller farms were older.

#### APPENDIX III: RECONCILIATION OF FCRS AND ERS SECTOR AGGREGATE ACCOUNTS

Cash and net farm income estimates developed for farm operators from the FCRS differ from net cash and farm income estimates that are derived for the farm sector as a whole. They are conceptually equivalent measures of income. Farm income is earned by three types of individuals or corporations: operators, landlords, and contractors. Development of ERS net income estimates require that analysts expense net rent received by nonoperator landlords. As a result, the residual ERS income includes the income of both operators and contractors. Because ERS estimates are based on NASS cash receipts data, coverage for both operator and contractor income is probably very complete.

FCRS enumerators collect income data only for commodities sold from a farm or ranch. If a product is removed from the farm without being sold, it is not reported as operator sales, although for livestock producers, the portion of these sales retained by the farm operator is recorded as custom feeding income. For the 1986 survey, we tried to identify the value of agricultural commodities produced under contract which gave an estimate of \$6 billion. This estimate is likely very low since the survey question asked for the value of products produced under marketing contracts instead of all contractual arrangements that may or may not include marketing such as feeding. While some major contractors were accounted for in the FCRS, others were undoubtedly missed. Moreover, the survey did not account for the total value of livestock produced under contract. Several hundred operators reported custom feeding income but did not report the value of livestock removed from the farm (likely due to the way the question was asked). The operator income data appear to be fairly good given our data analysis effort to evaluate the amount of underreporting. Obtaining contractor data is another step that we are taking to improve the linkage between operator and sector income accounts.

The debt figures carried in the sector balance sheet for December 31, 1986, are greater than those reported from USDA's Farm Costs and Returns Survey. The difference amounts to \$78 billion or 44 percent of the balance sheet debt (app. table 11). Much of this difference can be explained by the conceptual differences underlying the debt figures from the two sources. Debt reported in the sector balance sheet is defined as all loans outstanding that are secured by farm real estate, including loans on the farmer's dwelling if it is located on the farm, plus all nonreal estate farm loans. These are defined by each lender, and definitions vary. In contrast, the FCRS asks farm operators only for their farm business debt.

The definitional differences between the sector balance sheet and the FCRS include the farm debt of landlords and debt described as farm sector debt used for nonfarm purposes. The debt on these two components is carried in the balance sheet but are not picked up in the FCRS.

To estimate farm debt of landlords, the ratio of landlord farm debt to farm operator business debt from the 1979 Farm Finance Survey (10.5 percent) was applied to the 1985 FCRS farm operator business debt. The result is \$10.4 billion for landlords' share of debt.

Debt for nonfarm purposes held by farm operators was also estimated by using figures from the 1979 Farm Finance Survey. The balance sheet defines debt based on the collateral for the loan instead of the purpose of the loan. For example, if the farmers are securing loans on farm real estate and using these loans to educate their children, then the loans are counted as farm real estate debt in the balance sheet, but not as a farm business debt in the FCRS. The 1979 survey indicated that total debt held by farm operators was 8.8 percent greater than their farm debt. This percentage was applied to the FCRS figure for farm operators' business debt.

Differences in definitions account for at least \$39 billion of the difference in total sector debt and total debt reported by operators. The \$39 billion left in unexplained differences could occur either because the assumed amount of debt owed on farm dwellings in the sector balance is too small, landlords owe more than commonly assumed, operators' debt for nonfarm purposes is larger than assumed, the aggregate balance sheet debt is overestimated, especially for categories like individuals for which little data exist, or the FCRS underestimates operator debt totals.

Estimates of asset levels also differ between the sector balance sheet and the FCRS. The FCRS estimates \$388 billion in assets excluding farm households compared with \$711 billion in the aggregate sector balance sheet. The vast majority of the difference (66 percent) is accounted for by the difference in real estate assets; the FCRS measures only operator-owned real estate assets.

1986 Farm Costs and Returns Survey, USDA

#### APPENDIX V: DISTRIBUTION OF FARM OPERATORS, ASSETS, AND DEBT BY RETURNS TO EQUITY AND BY DEBT/ASSET RATIO ACROSS LENDERS

Appendix tables 17 and 18 provide data which allows for a discussion of the distribution of operators debts, and assets by return on equity categories presented in earlier in this report. Tables 19 through 23 support the earlier discussion of lender perspective.

| Appendix table | 17Distribution of farm op | perators, debt | and assets | by farm business return |
