Marketing Research Report No. 284 UNITED STATES DEPARTMENT OF AGRICULTURE

> Agricultural Marketing Service MARKETING RESEARCH DIVISION

This study of consumption of milk in schools in the United States is part of a broad program of research to expand markets for farm products.

Appreciation is expressed for the cooperation of the many school officials who made available the data upon which this report is based. Special acknowledgement is made to Allen D. Manvel, Chief, Governments Division, Bureau of the Census, and his staff.

This study was conducted under the direction of Robert M. Walsh, Chief, Market Development Branch, Agricultural Marketing Service. William S. Hoofnagle of the same Branch rendered valuable assistance in the analysis of data and preparation of this report. Officials of the Food Distribution Division, particularly S. C. Vanneman, Chief, Program and Analysis Branch, gave valuable assistance in the planning of the study.

PREFACE

MILK CONSUMPTION IN THE NATION'S SCHOOLS

BY

Kenneth E. Anderson, Market Development Branch Agricultural Marketing Service

SUMMARY

This study discloses the extent of milk services in the Nation's public schools. Daily consumption of milk per pupil averaged 0.7 half-pint in schools participating in the Special Milk Program during the survey period, 40 percent more than the average of 0.5 half-pint in other schools serving milk, according to a study by the Agricultural Marketing Service. About half the milk consumed in schools was with plate lunches and the other half was consumed at other times, as an a la carte item, or as a supplement to packed lunches.

Children in public elementary and secondary schools purchased 409 million half-pints of milk during the month of the survey.

Of this total, 186 million half-pints were consumed with meals by children participating in the National School Lunch Program. An additional 204 million half-pints were sold in schools participating in the Special Milk Program which includes most of the schools in the National School Lunch Program as well as other schools. These two programs accounted for 390 million half-pints or about 95 percent of all milk sold in public schools. These estimates are based on a survey of 4,347 schools selected on a probability basis to represent all public schools below the college level.

Pupils paid an average of 3.1 cents per half-pint for milk in schools participating in the Special Milk Program, nearly 50 percent less than the average of 5.9 cents charged in other schools. For schools participating in both the National School Lunch and Special Milk Programs, the average price paid was still lower--2.9 cents. 1/

The present report shows the consumption of milk in schools by type of lunch service, regions, population density, size of school in terms of enrollment, and by grade level, that is, elementary grade, high school, and combination grades.

Not all public schools serve milk. Of the approximately 106,000 public elementary and secondary schools in the country, 79,000 or 74 percent had some form of milk service during the survey period, March 1957. Almost all of the schools serving plate lunches had milk service, both those under the

1/ In an earlier study covering 2 major cities, it was found that with a reduction of about 50 percent in price made possible by participation in the Special Milk Program, consumption of milk per pupil increased 50 to 100 percent. Anderson, Kenneth E., "The Special Milk Program, its effect on consumption in St. Louis and Los Angeles Schools." U. S. Department of Agriculture, Marketing Research Report No. 209, January 1958.

National School Lunch Program and other schools serving plate lunches. Milk was served in 85 percent of the schools having a la carte lunch service and in 43 percent of the schools without lunch service.

The proportion of schools serving milk was highest in the Northeast and Southeast, and lowest in the Midwest. But the Midwest showed a greater total volume of milk consumed than other regions, reflecting a larger number of schools, lowest average prices in schools in the Special Milk Program, and highest average daily consumption per pupil for schools serving milk.

More schools in urban areas had milk service than those in rural and semirural areas. This was true also for schools having larger enrollments compared with small ones and for secondary and combination-grade schools compared with elementary schools. Nevertheless, total milk sales were greatest in the less densely populated areas and in elementary schools, reflecting primarily the relatively larger number of schools in these two categories. In addition, average daily milk consumption per pupil was highest in the less densely populated counties, small schools, and in the elementary and combination grades.

A relatively small proportion of schools serving milk had milk vending machines, 4 percent. Schools using only vending machines accounted for 3 percent of all schools serving milk and an additional 1 percent used vending machines as well as other types of service.

Consumption of milk per pupil was higher on the average in schools serving milk at noon and/or at other times than in schools serving milk at noon only. This was true for all types of lunch services.

In making a large-scale survey of school officials to obtain data on milk consumption in schools there was no opportunity to measure the consumption of milk by pupils in their homes and elsewhere. Consequently, it is not possible to state whether milk consumption by pupils outside of school was increased, decreased, or unchanged as a result of higher consumption in schools following introduction of the Special Milk Program.

INTRODUCTION

This study was conducted to evaluate the effects of certain factors such as price and frequency of service on milk consumption in the Nation's schools. It is part of a broad program of research designed to expand the market for agricultural commodities. Comparative data were obtained on milk consumption for schools participating and those not participating in the School Lunch and Special Milk Programs during March 1957. Data were tabulated by population den sity of the areas served by schools, size of school in terms of enrollment, and grades taught, that is, elementary, secondary, and combination grades. In tabulating the survey data by these characteristics, it was assumed there would be differences in pupils' milk consumption (1) in the less densely populated areas compared with the metropolitan areas; (2) in large and small schools; and (3) according to age, as indicated by elementary grades and secondary grades. It was anticipated that the study would either substantiate or negate the hypothesis that differences would occur among pupils attending schools under such varied conditions. Findings are based on a representative national sample of 4,347 of the approximately 106,000 public elementary and secondary schools. 2/ Sample selection, collection, and tabulation of data were performed by the Bureau of the Census for the Department of Agriculture.

The serving of milk to children has been an established practice for years in many schools. Although a large proportion of schools having a feeding program serve milk to pupils, there are also many schools without full-scale feeding programs that serve milk only.

The Special Milk Program was intiated in public and private schools September 1954, pursuant to Public Law 690, 83rd Congress, which amended a price support provision of the Agricultural Act of 1949. The purpose of the legislation was, in the language of the Act, "... to increase the consumption of milk by children in nonprofit schools of high school grade and under." In the 1955 fiscal year \$50 million was authorized for the program, \$60 million for the following year, and \$75 million for each of the 1957 and 1958 fiscal years. Beginning with the 1957 fiscal year the program was broadened to include summer camps, nursery schools, orphanages, and similar child-care institutions.

To the extent permissible under State and Territorial law, administration of the program in the States and Territories is the responsibility of the State department of education or other designated agencies of the State. The Agricultural Marketing Service administers the program directly in private schools and child-care agencies in States where no State agency is authorized to administer such programs.

In schools where a part of the cost of milk was reimbursed by the Federal Government, a sizable increase in consumption has occurred since the inception of the Special Milk Program. Schools operating under the program served 450 million half-pints in fiscal 1955; by 1957 the volume of milk had risen to almost 1.8 billion, an increase of 290 percent. 3/

2/ The Special Milk Program is designed to operate in private schools and summer camps as well as in public schools. However, in this study data were not obtained on the consumption of milk in such outlets.

3/ Agricultural Marketing Service. "Special Milk Program for Children, A Statistical Review of Program Progress 1955-1957," mimeographed, August 1957.

SCHOOL PARTICIPATION IN MILK PROGRAMS

Schools Serving Milk

Three out of four public schools in the U. S. served milk to pupils in March 1957, (tables 1 and 2). Nearly all of the schools serving plate lunches served milk. Eighty-five percent of the schools having a la carte service and 43 percent of the schools without lunch service served milk to pupils. 4/

Regionally, the Northeast and Southeast had the highest proportion of schools with milk service, while the Midwest, with the largest number of schools, had the lowest proportion serving milk.

Milk service was more likely to be found in schools in urbanized communities than in counties with a population density under 100,000. Milk service was found less frequently in small schools than in larger ones and less frequently in the elementary grades than in high schools and combination grades.

Of the schools serving milk, the largest number operated under the National School Lunch Program; 66 percent of all these schools served milk under the Program. One-fourth of the schools serving milk had no lunch service, and the remaining 9 percent had plate lunch service not under the National School Lunch Program or a la carte services only (table 3). Of schools serving milk, the largest number had the elementary grades, small enrollments, and locations in the less densely populated areas.

Schools In Special Milk Program

During the survey month, some 67,000 or 63 percent of all public schools in the United States participated in the Special Milk Program (tables 4 and 5). The Special Milk Program was found in 84 percent of the schools serving a complete plate lunch under the National School Lunch Program, in 73 percent of other schools serving plate lunches, in 52 percent of those having a la carte service only, and in 38 percent of those without lunch service (table 4). Special Milk Program schools as well as all schools serving milk, were found most frequently in the Northeastern and Southeastern regions. Schools in the urbanized areas, larger schools, and combination grade schools were found to participate in the Special Milk Program to the highest degree.

4/ A la carte service is defined as a food service in which individual food items are offered to pupils free-choice with no provision for a preplanned plate lunch.

1/ A complete tabulation of all schools by type of lunch service and by regions, population density, school size, and grades taught is given in Market Research Report No. 262, Participation of Schools and Pupils in School Lunch Programs in Elementary and Secondary Schools of the United States. U. S. Dept. Agr., August 1958.

Milk Sold

Some 409 million half-pints of milk, or half-pint equivalents, were sold in schools throughout the country in March 1957 (table 6). About half of the milk was consumed with plate lunches and the other half was sold at other times, as an a la carte item or as a supplement to packed lunches. Total milk sales in schools were heavily concentrated in those under the National School Lunch Program, which comprised 66 percent of all schools serving milk; pupils in these schools drank 322 million half-pints or 79 percent of all milk sold.

Of the 322 million half-pints sold in schools under the National School Lunch Program, 186 million were served with meals as a part of the lunch program, 131 million were sold other than with meals in schools having both the National School Lunch and Special Milk Programs, and 5 million half-pints of non-meal milk were sold in schools having only the National School Lunch Program. Pupils in other schools serving plate lunches and in schools without feeding services each accounted for about 10 percent of total milk sales. The remaining 1.8 percent was consumed in schools with a la carte service only.

The Midwest exceeded other regions in consumption of milk per pupil in schools serving milk. In addition, total sales were greater in that region than in any other despite the relatively low percentage of schools serving milk in that area. However, the Midwest contains a larger number of schools than any other region. A relatively large volume of milk was sold in schools in the Northeast and Southeast--nearly as much as in the Midwest. 5/ Milk sales in the Southwest and West were only slightly more than half as much as in the other 3 regions.

More than half of the total milk sold was consumed by pupils in schools located in less densely populated counties. There was a large number of schools in such counties, but a relatively low percentage of them served milk. Highest consumption per pupil was found in the less densely populated counties. Large schools and elementary schools each accounted for more than half of the total quantity of milk sold (table 6). Milk consumption per pupil in schools serving milk was highest in schools having small enrollments and in the elementary and combination grades.

Pupils in schools participating in the Special Milk Program drank 367 million half-pints or 90 percent of the 409 million half-pints of milk sold during the survey month. Of the 367 million half-pints, 204 million were sold under the Special Milk Program and the remaining 163 million half-pints were consumed with meals as a part of the National School Lunch Program. The remaining 42 million half-pints were sold in schools not participating in the Special Milk Program (tables 7 and 8). The proportion of milk consumed by pupils in each type of feeding service was about the same for those schools operating under the Special Milk Program as for all schools serving milk, and in both groups of schools almost one-half was consumed with meals.

Together, the Special Milk and National School Lunch Programs account for about 390 million half-pints or 95 percent of all milk sold in public schools.

In addition to the 409 million half-pints of milk sold in schools in March 1957, some 30 million half-pints were served free to pupils. Milk given free to pupils accounted for approximately 7 percent of total consumption in all schools serving milk. For the most part, distribution of free milk by regions, population density, size of school, and grade level was of the same relative order of magnitude as that reported for milk distributed with lunches or sold as an a la carte item. More than 90 percent of the milk served free was in Special Milk Program schools (tables 9-11).

5/ For the States comprising each region, see table 2, Appendix.

- 6 -

Prices Paid For Milk

Pupils in schools participating in the Special Milk Program paid an average of 3.1 cents per half-pint of milk. The price was 5.9 cents in schools not in the program. For schools participating in both the National School Lunch and Special Milk Programs the average price paid was still lower-2.9 cents. In schools having no provision for lunch service but participating in the Special Milk Program, pupils paid an average of 3.3 cents per half-pint. The highest average price paid, 4.0 cents, in any group of schools operating under the program was in those offering a la carte service only (table 12). There was a wide range in the prices paid by pupils per half-pint of milk in both schools participating and schools not participating in the Special Milk Program. Average daily consumption per pupil tended to be higher in schools in the Special Milk Program, where prices were lower than in schools not in the program. For the most part, per capita consumption of milk was highest in small schools where prices paid per half-pint were generally lowest (table 13).

Vending Machine and Other Milk Service

Of the approximately 79,000 schools serving milk in March 1957, 96 percent had no milk vending machines, 3 percent had vending machines with no other service, and 1 percent had vending machines and other service. Use of vending machines was somewhat more prevalent in the Midwest than in other regions, in high schools, and outside the 21 largest metropolitan areas (table 14). 6/

Frequency of Milk Service

Schools were classified as those serving milk at noon only and those serving at noon and/or at other times. Approximately 43 percent of schools serving milk were in the first category and 57 percent in the second. A smaller percentage of schools serving milk at noon only than at noon and/or at other times held for National School Lunch Program schools and for those having no lunch service. But a higher proportion of schools serving milk at noon only was found in those having other plate lunches and in those with a la carte service only.

Milk service at noon and/or at other times was most popular in the Midwest and Southeast, in less densely populated counties, in schools with less than 500 pupils, and in schools having elementary and combination grades.

6/ It would have been desirable to compare non-meal milk consumption rates of pupils in schools having vending machines in addition to other serving methods with those in schools without such machines. To obtain data on nonmeal milk consumption rates for schools utilizing vending machines would require a detailed study.

488083 O - 58 - 2

The average daily rate of milk consumption per pupil was higher in schools serving milk at noon and/or at other times than in schools serving only at noon. All types of lunch service, that is, complete plate lunch service under the National School Lunch Program, other plate lunch service, a la carte only, and milk service only, followed this pattern. Consumption per pupil was highest in schools serving at noon and/or at other times in the Midwest, with a rate of 1 half pint daily, as contrasted with 0.6 half pint in the Northeast. Also, on a national basis, per capita consumption was highest among pupils in schools situated in less densely populated areas, in small schools, and in schools having elementary and combination grades (tables 15 and 16).

APPENDIX

Methodology

For the study of milk consumption a random sample of approximately 5,000 individual public elementary and secondary schools throughout the United State was selected. As a result of the preparations for the 1957 Census of Governments, the Bureau of the Census compiled a complete card listing of all public school systems in operation as of October 1956, together with information for each system as to the number of individual schools operated. These cards were arranged by States. The districts or systems were sampled with probabilities proportionate to the number of schools in the district or system. All sample systems were then canvassed for lists (directories or other) of their individual schools. Schools were selected within the sampled systems so as to produce a self-weighting sample with the uniform-sampling fraction of 5/96. This yielded a sample of approximately 5,500 schools which was subsampled systematically at random to reduce the number to 5,000 schools for survey coverage.

The survey was conducted by mail, employing successively more intensive followup steps to stimulate response until the cut-off time for data collection, by which time a response rate considerably in excess of 90 percent had been attained.

Incoming materials were examined for internal consistency, conformance with instructions, completeness, and other quality standards. Where necessary, correspondence was undertaken to correct deficiencies and improve the accuracy of the reporting on all questions. Some replies were ascertained to be unusable for tabulation, and some schools were found to be closed as of the survey month. The net result was a sample of 4,347 schools providing usable information.

The method of expansion involved application of a factor (24.3722) to the reported information, and adding the results to obtain regional and national totals. As a result of rounding in the addition process, the reported national total of schools is 20 more than would have resulted from the direct application of the factor to the entire sample, without subclassification. The factor of 24.3722 is the ratio of all elementary and secondary public schools in the U. S. to such schools in the sample.

Variance calculations were made as to key measures within the framework of the foregoing sample description (tables 17 and 18). These calculations do not reflect possible biases because of nonresponses. It can be seen from these calculations that, although the sample was designed to produce national estimates, regional totals for much of the information have relatively low sampling variability. The formula used to compute sampling variations of the number of schools serving milk by type of lunch service is noted below:

v =
$$\begin{pmatrix} 1 - n' \text{ reg.} \\ N' \text{ Reg.} \end{pmatrix} \begin{pmatrix} \frac{1}{n'g} - \frac{1}{n'\text{ reg.}} \end{pmatrix}$$

N' Reg. = total for region
n' reg. = sample in region
n' g = number of positive answers for cell

Sampling variability as shown in tables 17 and 18 was calculated by dividing the standard deviation (v) by the estimated number of schools. To illustrate the use of sampling variability, consider the number of schools in the Northeast region offering milk as well as a plate lunch under the National School Lunch Program. An estimated 10,041 schools are included in this category, and in table 17 the coefficient of variation of this estimate is 3 percent. There are, therefore, about 2 chances out of 3 that the number of schools in the Northeast region offering milk as well as a complete lunch under the National School Lunch Program as determined by a complete census would be between 9,740 and 10,342.

census by less than the percentages shown (there are about 19 chances out of 20 that the quantities estimated from this survey would differ from the results of a complete census by less than twice the percentage shown). All sampling errors shown are coefficients of variation at the one sigma level. At this level, the chances are 2 out of 3 that the quantities estimated in this survey would differ from the results of a complete NOTE:

Table 18.--Sampling error, milk sold: Sampling error of estimates of total milk sold with meals and separately in schools partici-pating in the Special Wilk Program, by type of lunch service, and by regions, population density, size of school, and grades taught, March 1957 <u>1</u>
