PREFACE

This report revises and updates information contained in Marketing Research Report No. 577, "Estimated Number of Days' Supply of Food and Beverages in Retail Food Stores, 1962." The number of days' supply of retail food and beverage inventories is shown for counties and independent cities in the contiguous States. Food stocks are shown also by type of storage and geographical distribution among the eight civil defense regions.

Funds for the revision were provided by the Office of Civil Defense, Department of Defense, under Contract No. OCD-PS-64-203. Joseph Romm, Louis Schwalb, and Samuel E. McClung represented the Office of Civil Defense and assisted in planning and coordinating the project. The study was conducted in the U.S. Department of Agriculture under the general direction of Robert E. Frye and William S. Hoofnagle of the Market Development Branch.

The copyright on all population estimates in this report, unless otherwise noted, is held by Sales Management Survey of Buying Power, and they are published herein by expressed permission. Further reproduction is forbidden.

ESTIMATED NUMBER OF DAYS' SUPPLY OF FOOD AND BEVERAGES
IN RETAIL FOOD STORES, 1963--A Civil Defense Study

By
Eugene C. Pape, Jr., marketing specialist
and
Michael G. Van Dress, agricultural economist
Marketing Economics Division
Economic Research Service

FINDINGS

On the basis of 2,000 calories a day, there was a 15.1-day supply of food and a 3.3-day supply of beverages in retail food stores in 1963, for each person in the 48 contiguous States of the United States (tables 1-2). Regionally, supplies varied only moderately from a 14.3-day supply of food and a 2.9-day supply of fluids in Region III to a 19.5- and 4.2-day supply of food and fluids in Region VIII (figure 1). Beverages are included under food inventories as calories and are counted also as fluid ounces under nonconcentrated liquids. Liquids include milk, soft drinks, juices, beer, ale, and wine.

Table 1.--Estimated days' supply of food and fluids in retail food stores by type of storage, civil defense regions, 1963

Region	Food Supply					Nonconcentrated fluids
	Total	Fresh	Frozen	Canned and bottled	Dried and packaged	
	Days	Days	Days	Days	Days	Days
United States..	15.1	2.4	0.2	5.3	7.2	3.3
Region I....	14.9	2.6	0.3	5.3	6.7	3.5
Region II....	14.5	2.3	0.2	5.1	6.9	3.2
Region III..	14.3	2.0	0.1	5.2	7.0	2.9
Region IV....	15.4	2.5	0.3	5.0	7.6	3.3
Region V....	15.0	2.1	0.2	5.4	7.3	3.1
Region VI....	17.0	2.7	0.3	5.7	8.3	3.8
Region VII..	14.6	2.1	0.1	5.2	7.2	3.4
Region VIII..	19.5	2.6	0.3	7.5	9.1	4.2

Most food stocks held by retail food stores can be kept for an extended period without refrigeration (table 3). For the country as a whole, canned and bottled and dried and packaged products represented a 12.5-day supply, or 83 percent of total stocks in 1963. Of the remaining supply, fresh products accounted for a 2.4-day and frozen products for a 0.2-day supply.

1/ SEE FOOTNOTE 1, TABLE 4, FOR DEFINITION OF COUNTY DENSITY GROUPS.

In terms of number of days' supply, 1963 estimates of food and beverage stocks in retail food stores at the U.S. and regional levels were relatively unchanged from 1960. ^{1/} However, the estimated number of days' supply in some counties and independent cities differed substantially. This is partly because 1963 estimates were based on retail food sales volume, while 1960 estimates were based on population. This is reflected in the estimates for Falls Church and Norfolk City, Virginia. For example, Falls Church had a 99-day supply of food per capita, whereas Norfolk City had a 15-day supply. Falls Church, because of the proximity of suburban areas in neighboring counties, has retail food sales disproportionate to its population and, therefore maintains food and fluid inventories in excess of the average. On the basis of population alone, Falls Church would have been credited with approximately a 12-day supply of food per capita in 1963, rather than a 99-day supply. Conversely, estimates of average food supplies per capita for counties and cities such as Norfolk City reflect food retailing activity commensurate with the population, and therefore differences between 1960 and 1963 were minor (see table 4, pp. 7-81).

Primary among factors affecting per capita supply within counties are (1) extent of intercounty trade; (2) physical attractions which are conducive to tourism; (3) large institutions, such as universities or colleges which people from other counties attend or visit; and (4) size of population.

BACKGROUND

As part of its program responsibility, the Office of Civil Defense is engaged in developing and periodically appraising plans for overall preparedness measures to be implemented in an emergency. Within this area of planning responsibility, civil defense officials have developed programs for carrying out emergency feeding operations with food resources available at different levels of the marketing system. In order to keep plans for these programs realistic, assessments of quantity, composition, and geographical distribution of available resources need to be kept current.

In this connection, the Office of Civil Defense requested the Department of Agriculture to review the reasonableness of estimates of retail food stocks in Marketing Research Report 577 and to update the estimates, if warranted, to reflect changes in population. The 1960 estimates were developed from inventory data collected in a national survey of retail food stores in 1957 and revised to agree with the 1960 Census of Population.

Additionally, the Department was requested to appraise the accuracy of alternative techniques of apportioning regional estimates to counties. Initially, regional food stocks were imputed to the counties in direct proportion to population. However, because of advances in inventory control management and the growth and relocation of food retailing, this method of estimating food stocks at local levels might tend to misrepresent food inventories. ^{2/}

^{1/} Marketing Research Report 577. See Preface for complete citation.

^{2/} For a full discussion of this phase of the study see the appendix.

METHODOLOGY

The estimating procedure developed for this report is based on retail food sales of establishments included in the 1957 survey. 3/ The sales dollar method of estimating retail food store inventories is founded on a relationship established between 1957 calories and fluid ounces and 1957 retail food sales. The relationship was developed in terms of factors (ratios of calories and fluid ounces to retail food sales) for counties in each of the eight civil defense regions according to population density. 4/

Estimates of the supply of food and beverages on inventory at retail in 1963 were made by applying the appropriate caloric and fluid ounce factors to the retail food sales in each county and independent city. Adjustments in sales were made to compensate for changes since 1957 in retail food prices, nonfood sales, and inventory-to-sales ratios, to assure that data for the two periods would be comparable. Supply per capita was computed by dividing calories and ounces by 1963 population figures, and number of days' supply by dividing calories and ounces available per capita by 2,000 and 32, respectively--the number of calories and ounces specified per person, per day.

Inventory data contained in Marketing Research Report 577, and data on retail food sales compiled by Sales Management, Inc., 5/ were used to derive caloric and fluid ounce factors. The publications presenting these data fully report on methodology used in their collection and tabulation, therefore, details are not given here.

1/ COUNTIES AND INDEPENDENT CITIES WERE ASSIGNED TO 1 OF 3 POPULATION DENSITY GROUPS AS FOLLOWS: DENSITY GROUP A INCLUDES COUNTIES IN THE 25 LARGEST STANDARD METROPOLITAN STATISTICAL AREAS; DENSITY GROUP B INCLUDES COUNTIES WITH A POPULATION OF 100,000 OR MORE, EXCEPT THOSE INCLUDED IN DENSITY GROUP A; AND DENSITY GROUP C INCLUDES COUNTIES WITH POPULATIONS LESS THAN 100,000, EXCEPT THOSE INCLUDED IN DENSITY GROUP A.

*COPYRIGHT, 1964, SALES MANAGEMENT, INC.

APPENDIX

In the 1957 survey, inventory data from a sample of approximately 7,000 retail food establishments were collected and estimates of caloric and fluid ounce supply compiled for major census regions and population-density groups. Population-density group totals for regions were divided among counties and independent cities in direct proportion to their population.

This method of estimating the size of available resources is less flexible than the method based on retail sales, particularly at local levels. Relative differences in commercial food retailing, for example, are not considered, nor are changes over time in retail inventory levels. A more responsive alternative technique based on retail food sales was developed and used in making estimates for this report.

The reliability of this method and the population method of estimating food and fluid supplies was evaluated statistically to compare the relative accuracy of each with data for U.S. density group totals projected from the original survey sample.

Regression analysis was used to measure variation at the regional density group level between retail food sales and known supplies, and between known supplies and population data. Both were highly correlated with known supplies with less than 3 percent (R^2) of the variability unaccounted for (table 5).

Table 5.--Summary of coefficients of determination for retail food sales and population data on known supplies for population densities within regions

Density group	:	Retail food sales	:	Population
	:	$\underline{R^2}$:	$\underline{R^2}$
Density A	:	.976	:	.981
Density B	:	.990	:	.971
Density C	:	.984	:	.991

In addition, homogeneity of variance tests (F ratio) were made between known supplies and caloric data computed with the two techniques. The ratio of variances is no greater than would be expected as a result of chance at the 5-percent probability level. Caloric data were converted to number of days' supply and the percentage variation about the mean was compared with expected variation. The sales dollar method varied approximately 3 percent and the population method 8 percent.
