# CHANGES IN FOOD WHOLESALING

Leland Southard and Terry L. Crawford  
Marketing Economics Division

**ABSTRACT:** Food wholesaling establishments have increased their sales by about one-half in the past decade. Food wholesaling has had a dynamic change in shares (percent of sales of a market by type of firm) while margins and profits as a percent of sales have remained constant. Affiliated wholesalers have increased their share of the food store market, with other wholesalers shifting sales to industrial and commercial users.

**KEY WORDS:** Food wholesalers, margins, marketing costs.

Wholesaling is the market function of purchasing, assembling, and distributing goods for resale to retail outlets. The wholesaling function may be performed by an independent firm or a unit of an integrated retailer. The establishments performing the wholesaling function and the markets served by such wholesalers changed dramatically during the 1960's.

Food wholesaling has traditionally been considered a function of independent firms. Developments have eroded this view as varying degrees of integration have transferred a substantial part of the wholesaling function to other types of organizations in the market channel for food.

An example of transfer in the control of the wholesaling function is the integrated retailer who performs his own buying, assembling, and distribution. By taking over the wholesaling function, integrated retailers (when large enough) have been able to realize savings through volume purchasing and the control and co-ordination of the other wholesaling functions. Integrated retailers' share of total food store sales increased only slightly from 1963 to 1969. Still, they account for almost half of total retail food store sales. This dominance places constant competitive pressure on non-integrated retailers.

The response to the competitive pressure can be seen in actions both by retailers and wholesalers in the 1960's. Many non-integrated retailers built larger stores and looked at alternatives for reducing the cost of acquiring their merchandise from many wholesalers. Many of these non-integrated retailers organized cooperatives or joined voluntary groups to realize savings from volume purchasing.

Wholesalers responded by adopting changes which provide non-integrated food retailers with products and services at a cost that would permit them to be competitive with the integrated retailer. Many wholesalers organized voluntary groups of retailers that contract for merchandise and services from the wholesaler. Other wholesalers not forming voluntary groups increased their sales to the away-from-home market including restaurants and hotels.

The dominant alternative wholesaling structure that has emerged for the retail food store in response to this competition is the affiliated wholesaler. Affiliated wholesalers are of two types: Cooperative wholesale buying groups and voluntary merchandising groups. Cooperative wholesalers are those owned by the retailers they serve. Voluntary wholesalers are firms contracting to serve independent stores and chains often operating under a common name.

In 1963 affiliated stores accounted for about one-third of grocery store sales while integrated chains accounted for two-fifths (fig. 6). However, in 1969 affiliated stores accounted for about the same proportion of grocery store sales as integrated chains (46-47 percent). Sales of independent stores—those not affiliated with a cooperative or voluntary group—declined from about one-fourth in 1963 to less than one-tenth in 1969.

To analyze the changes in the food wholesaling structure during the last decade, we examined 4 key indicators of performance: market share, gross margin, profit, and capital efficiency. The market share analysis was centered around sales to retail food stores and the secondary market for food away from home. This

Figure 6

enabled us to study the effect of affiliated wholesalers, integrated retailers, non-affiliated general-line grocers, and specialty wholesalers on the wholesale marketing environment. Margin data were obtained from the *Census of Business* for all firms. However, the Internal Revenue Service data on profits and capital efficiency by size category relate only to corporate firms.

### Market Share

In 1967, 88 percent of sales by general-line grocery wholesalers was to food stores (table 6). The remainder was distributed among public eating places, institutions, and others. This analysis will concentrate on the change in market shares of wholesalers selling to retail grocers.

### Affiliated Wholesalers

Affiliated grocery wholesalers—those sponsoring voluntary groups of retail food stores and those

cooperatively owned by retail food stores—are now accounting for sales about equal to those of food stores performing their own wholesaling function. Moreover, the sales growth of affiliated wholesalers and their retailers is increasing at a faster pace than growth in integrated food stores.

The rapid rate of growth by affiliated wholesalers may not continue long into the seventies. Up to this point affiliates' growth in market share has been at the expense of the non-affiliated independent wholesaler and his independent food store customer. The continued growth in market share of affiliated retailers will depend to a larger extent on cost and quality of services and merchandise provided by the affiliated wholesaler and ability of the retailer to use these services effectively.

Affiliated wholesalers have grown both in total sales and number of establishments. Affiliated wholesalers had sales per establishment five times those for non-affiliated wholesalers in 1967 (table 7). The number

of affiliated wholesale establishments increased by more than a third from 1958 to 1967 to a total of 907 firms. The growth of affiliated wholesalers has been due to the active recruiting of retailers by offering them services and competitive advantages similar to those available to the integrated retailer.

Sponsoring of retailers affords the wholesaler a relatively stable base of customers who contract for his services. The affiliated wholesaler often provides the retailer with a full line of merchandise, promotional programs, service specialists in store operations, and managerial assistance. Many large affiliated wholesalers have their own electronic data processing (EDP) facilities. This allows automatic reorder and other managerial analysis. Computerized check-out and other data analysis techniques on product movement at retail will require access to computers for which the wholesaler is the logical source of support. Individual stores, using EDP provided by their wholesaler, can adapt the merchandise mix to the needs and preferences of their neighborhood.

Unit pricing is one recent development that needs the speed of a computer. This practice is a labor consuming activity which can be minimized by access to computer printed labels. Legislation requiring unit pricing is now in effect in New York City and Massachusetts. In other areas legislation is being considered and many firms are voluntarily using unit pricing as a competitive tactic. Without computer access, unit pricing and variable price merchandising may be prohibitive. The development of unit pricing as a retail merchandising practice should favor the growth of the affiliated wholesaler at the expense of the independent wholesaler.

Many voluntary groups provide financial assistance, accounting, store design, site location, advertising, store employee training, private labels, and many other services designed to improve retail effectiveness. Services provided by retailer-owner cooperatives vary, though many are expanding them. This type of operation provides the retailer dual benefits: The economies resulting from purchasing in large quantities and a share of any profits earned by the cooperative.

Multi-unit retailers (2 or more store) of affiliated groups tripled sales from 1963 to 1969. The absolute dollar sales growth of multi-unit retailers equaled the growth of integrated retailers. The rapid sales growth of multi-unit retailers resulted from their adoption of a marketing strategy similar to that of integrated retailers. Many of these multi-unit retailers were small and lacked the volume to support the use of their own warehouses. As a consequence, many multi-unit retailers have closed their own warehouses or, when expanding into new areas, have chosen to use affiliated wholesalers. Existing cooperatives and voluntary groups have been active in responding to the needs of multi-unit retailers.

Single stores belonging to cooperative and voluntary groups showed a modest increase in sales of \$4 billion from 1963 to 1969. Part of this increase was due to the

switching of single stores from independent wholesalers to voluntary or cooperative suppliers. On the other hand, many single stores belonging to voluntaries or cooperatives grew to multi-unit operations during this period.

### Non-Affiliated Wholesale Establishments

Sales and number of non-affiliated general-line wholesale establishments rose between 1958 and 1967 in contrast to the slight decline in total wholesale grocery establishments. However, the share of non-affiliated establishments' sales to food stores declined. This decline was more than offset by sales to industrial users. Between 1958 and 1967, their percentage of sales to industrial users, including public eating places, increased four times.

### Specialty Wholesalers

Specialty wholesalers, like the non-affiliated general-line grocery wholesalers, have increased sales to the expanding away-from-home market in the past decade. Since integrated and affiliated warehouses have tripled the number of items handled, specialty wholesalers have found it harder to compete in the food store market.<sup>1</sup> In rural areas where large institutions and eating places were not present, general-line and specialty wholesalers lost much of their market to the affiliated wholesaler.

### Gross Margins

Gross margins and operating expenses as a percent of sales vary by type of wholesaler (table 8). General-line grocery wholesalers have the lowest gross margin. Fresh fruit and vegetable specialty wholesalers have the highest gross margins as a percent of sales as a result of their relatively higher operating expenses for refrigeration and the loss of products due to spoilage. Other specialty wholesalers have a higher gross margin than general-line grocery. Wholesalers who handle goods requiring special conditions such as cold storage for meat and frozen foods have higher margins to cover costs.

Traditional general-line grocery wholesalers (non-affiliated) have higher operating expenses than affiliated wholesalers (voluntary and cooperative). The affiliated wholesalers have achieved some competitive advantages through economies of scale, primarily because they serve larger volume retailers. They have also offered more services to their retailers.

The cooperative wholesalers have lower operating costs than the voluntary wholesalers. The cooperative wholesalers tend to serve only retail food stores, while the voluntary wholesalers have begun to serve the away-from-home food market. Because of larger deliveries to the food stores than restaurants, it is cheaper to service the retail food store. Cooperative wholesalers have about two and one-half times the sales per establishment as the voluntary wholesalers.

Labor was the food wholesalers' largest operating cost, accounting for slightly less than half of the gross margin in 1967.<sup>2</sup> Business taxes were the second major cost.<sup>3</sup> Depreciation and rent, because of large capital requirements, followed in order of importance.

### Profits of Corporate Wholesalers

Despite a changing market volume of business during the 1960's, profit ratios as a percent of sales showed little change. Food wholesalers' profits between 1958 and 1967 (latest data available) averaged slightly less than 1 percent of sales and more than 11 percent of net worth.<sup>4</sup> Profit ratios varied by asset size (table 9).

The largest firms had the highest profit rates, averaging about 1 percent of sales and close to 12 percent of net worth. The medium size wholesaler did about as well as the larger size. However, the smallest wholesalers' profit ratios averaged less than one-half of 1 percent of sales and only 3 percent of net worth.

Small wholesalers had returns on net worth averaging less than half of the prime interest rate (6-8%). Economic theory for competitive markets would indicate that with a passage of time there should be an exodus of such firms with capital flowing to more productive uses. Such a mass liquidation has not

occurred. On the contrary, small wholesalers account for one-half of all corporate wholesalers. The number of small corporate wholesalers has remained constant in recent years even though they account for only 7 percent of the corporate sales.

### Capital Efficiency of Corporate Wholesalers

Capital productivity is related to size of firm for food wholesalers. Larger firms substitute capital for labor and are less efficient users of capital (when considered by itself) than their smaller rivals. This does not imply that the smaller firm is optimal in the use of all inputs.

Sales per dollar of assets provide a measure of efficiency with respect to total capital necessary to conduct a business. This measure suffers when using traditional accounting sources because of the mixed practice of leasing capital goods or owning them. Owned capital appears on the balance sheet as an asset; leased facilities do not. Small wholesalers had the highest sales per dollar of assets, averaging more than 7 to 1 for the period (table 10). The largest wholesalers averaged 5 to 1, which was the same as the average of all firms. This reflects the weight of larger size wholesalers.

Sales per dollar of inventory provide a direct measure of capital efficiency with respect to the product being distributed. This is a more meaningful measure of capital efficiency in the trade industries than in manufacturing. All wholesalers averaged \$19 of sales to \$1 of inventory during 1963-69. Small wholesalers were more efficient in inventory turnover, averaging 46 to 1.

<sup>2</sup> *Census of Business, 1967*, U.S. Department of Commerce.

<sup>3</sup> *Statistics of Income, 1967*, Internal Revenue Service. <sup>4</sup> IRS data for profits as a percent of net worth fluctuated widely from year to year as a result of changes in classification.

data).

The capital efficiency of small wholesalers is a result of handling a limited line of products and of not having enough sales volume to efficiently use larger laborsaving machinery. Small firms economize on capital equipment

by substituting labor, and many small wholesalers reduce the amount of capital needed by renting buildings and equipment.

Table 10.--Merchant wholesalers' sales per dollar of inventory and per dollar of asset, by asset size of firm, 1958-67
