The Impact of Climate Change on Canadian Agriculture: A Parcel Level Ricardian Analysis

Christopher Kimmerer, Brady J. Deaton

Department of Food, Agriculture, and Resource Economics, University of Guelph

Introduction:

- This study uses a sample of Canadian parcel level farmland values to estimate Ricardian impacts of climate change on agriculture
- The Ricardian approach was first proposed by Mendelsohn, Nordhaus, and Shaw (1994) as an alternative to crop-specific approaches
- The Ricardian approach applies a hedonic property to farmland values and includes climate measures as key explanatory variables

Source: Mendelsohn, Nordhaus, and Shaw, 1994

Research Contributions:

1. Estimate the first Canadian Ricardian impact of climate change in over 15 years

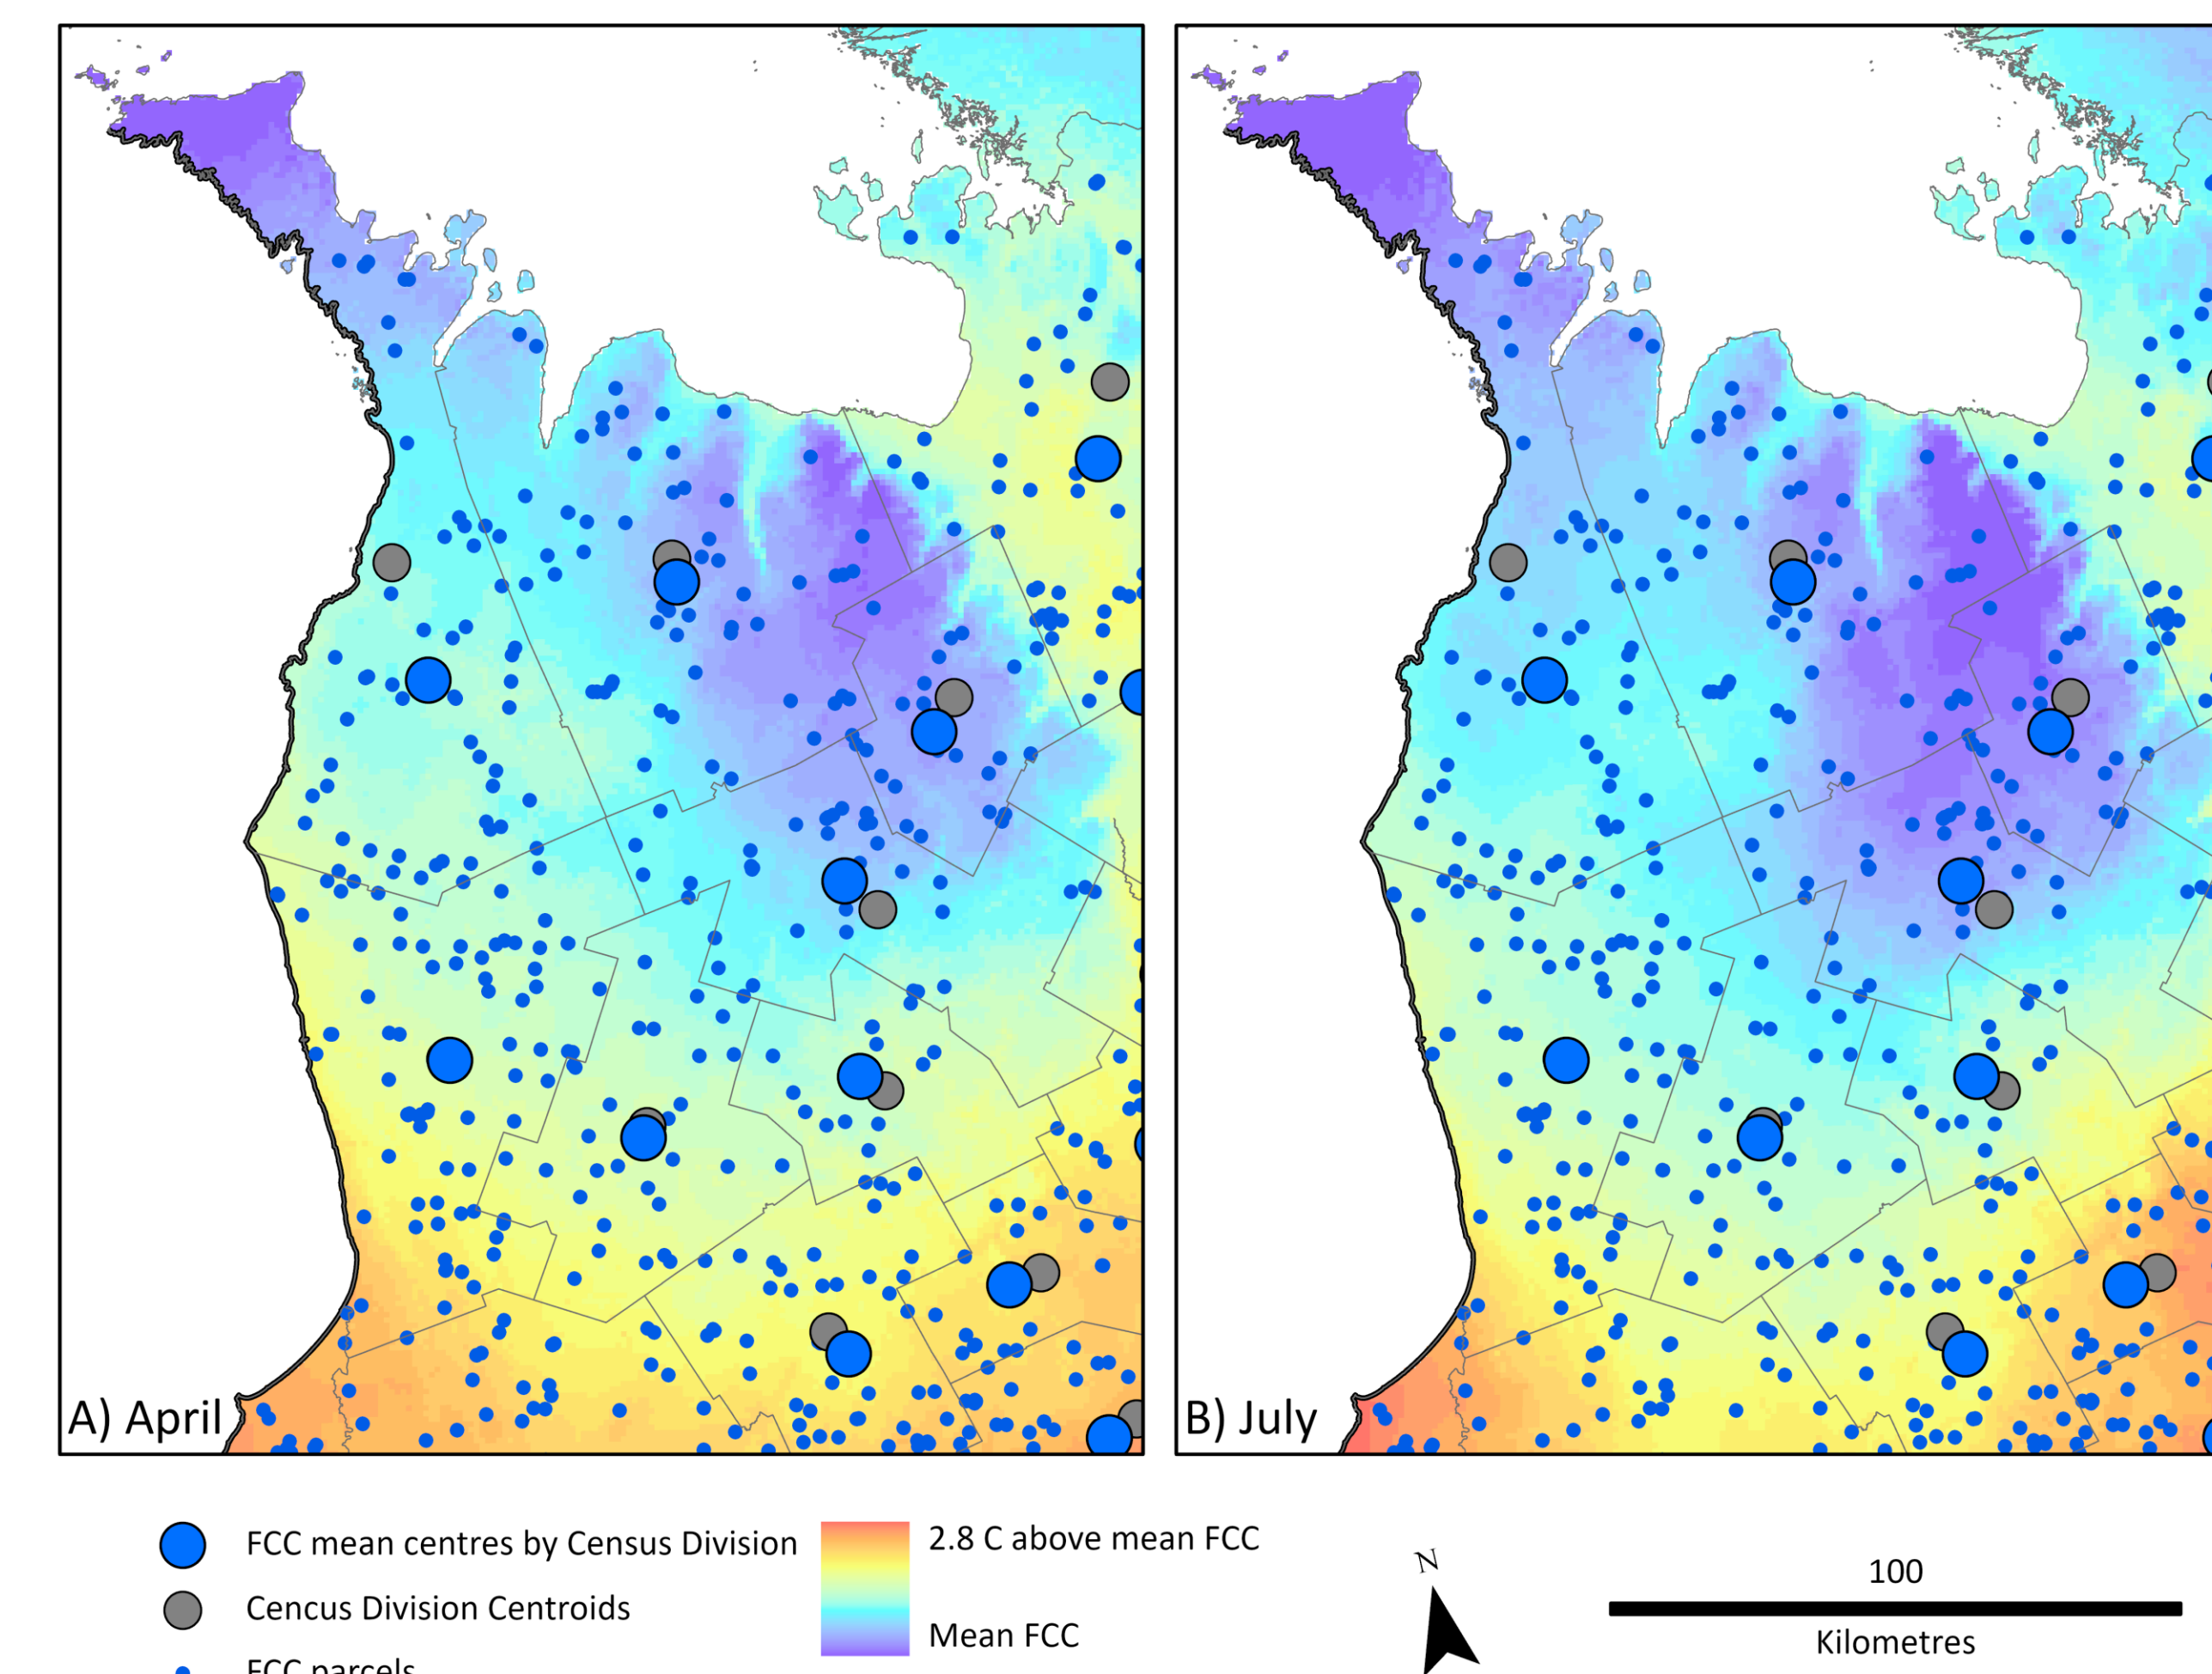

- Impacts from climate change are location specific
- Only three studies have applied the Ricardian approach to Canadian farmland values (Reinsborough, 2003; Weber and Hauer, 2003; Mendelsohn and Reinsborough, 2007)

2. Use a novel farm level dataset to investigate the impact of spatial scale within the Ricardian approach

- Recent studies have focused on methodological or theoretical concerns such as omitted variables (Schlenker et al. 2005, Ortiz-Bobea. 2020) or alternative methods of estimation (Severen et al. 2018)
- Only three studies have used granular spatial data on farmland value (Schlenker et al. 2006, Weber and Hauer 2003, Fezzi and Bateman 2015)

Data:

- Most studies have used county level averages for farmland values and all explanatory variables – including climate

- This study uses parcel level farmland values provided by Farm Credit Canada (FCC) - each datapoint is composed of real market transactions from the year 2020
- Historic and forecasted climate data were accessed from Adapt West and matched to the centroid location of each parcel
- Other control variables include soil quality, surrounding area population density and median total income

Empirical Approach

- The first stage estimates the marginal effect of climate on farmland values using a hedonic property model
- A spatial error model is used to allow for spatial correlation between observations

$$\ln(LV_{i,m,p}) = \beta' C_{i,m,p} + \theta' F_{i,m,p} + \tau' N_{m,p} + P_{FE} + M_{FE} + u_{i,m,p}$$

- The second stage calculates the average predicted change in farmland values resulting from climate change and is multiplied the total amount of farmland in Canada (~160 million acres)

$$\Delta LV_i = \hat{\beta}_j (Future_{i,j} - Historic_{i,j})$$

$$Ricardian Impact = \sum_{i=1}^n \Delta LV_i * 160M = \sum_{i=1}^n \hat{\beta} * \Delta Climate_i * 160M$$

Marginal Effects of Climate on Farmland Values:

| Variable | Base Model Coef. Sig. | Provincial FE Model Coef. Sig. | County FE Model Coef. Sig. |
|----------------|--------------------------|-----------------------------------|-------------------------------|
| April Rain | 2.823*** | 2.191*** | 1.301*** |
| April Rain Sq | -0.033*** | -0.027*** | -0.037*** |
| July Rain | 0.761*** | 0.778*** | -0.565** |
| July Rain Sq | -0.009*** | -0.017*** | -0.009 |
| April Temp | 47.858*** | 28.106*** | 45.054*** |
| April Temp Sq | 2.537*** | 1.949*** | 2.946*** |
| July Temp | -15.421*** | 2.435 | -9.702 |
| July Temp Sq | 0.590 | -0.025 | -0.067 |
| Pop. Density | 0.246*** | 0.238*** | 0.177*** |
| Pop. Den. Sq | 0.000*** | 0.000*** | 0.000*** |
| Obs. | 9866 | 9866 | 9866 |
| R ² | 0.4528 | 0.4625 | 0.5352 |

p-values: * < 0.10, ** < 0.05, *** < 0.001

Estimated Impacts of Climate Change on Agriculture:

| Model | Aggregate Impact | 95% Confidence Interval |
|---------------|------------------|-------------------------|
| Base | 44.83 | (40.84 , 48.81) |
| Provincial FE | 26.29 | (23.80 , 28.77) |
| County FE | -15.65 | (-23.37 , -5.93) |

Impacts are presented in \$ Millions CAD

Conclusions:

- The seasonal climate coefficients are sensitive to the inclusion of fixed effects
- All three models estimate small impacts from climate change on farmland values
- The estimated annualized impact from climate change ranges from \$2.24M CAD in benefits to \$700,000 CAD in damages, a small fraction of Canada's annual gross farm income of \$72 Billion CAD
- Next steps:
 - Add parcel level measure of urban pressure – distance to nearest city
 - Validate results using additional yearly data
