THE GROWING CONTRIBUTION OF THE TENNESSEE ALCOHOL PRODUCTS DISTILLING INDUSTRY TO THE TENNESSEE ECONOMY

David W. Hughes, Professor and Greever Chair in Agribusiness Development, Department of Agricultural and Resource Economics

Introduction

Estimates regarding the growth, structure (such as location) and contribution of Tennessee distilleries (alcoholic spirits producers) to the Tennessee economy are provided in this report. Covered in the analysis are the industry's size and growth with respect to other states and national trends and its location in Tennessee. The contribution of the industry in terms of tax revenues, tourism and foreign trade are discussed. Also discussed is the use of a distillery producer survey and an IMPLAN-based (IMPLAN Group LLC, 2015) input-output model of the 2019 Tennessee economy in arriving at model estimates. Estimation results with respect to the total (direct and multiplier-based) impact of the industry are then provided, followed by summary and conclusions.

Size of and growth in Tennessee distilling industry and other element

The Tennessee and national distilling industries have experienced strong growth in recent years as demonstrated in the number of reported establishments, employment and wages. As shown in Figure 1, the number of US establishments increased from 964 in 2018 to 1,549 in the first quarter of 2022 (a 60.7 percent increase), while the number of establishments in Tennessee increased from 37 in 2018 to 59 over the same period (an increase of 59.5 percent) (Figure 2). Nationally, distillery employment increased from 15,839 jobs in 2018 to 21,701 jobs in 2021 (US Department of Labor, 2022), while employment in the Tennessee industry grew from 1,492 to 2,060 over the same period (Figure 3 and Figure 4). By March of 2022, employment in the Tennessee industry had grown to 2,227 jobs. Nominal dollar earned annual income (wages and salaries) followed a similar trend, growing from \$1.053 billion in 2018 to \$1.429 billion in 2021 nationally (a 35.7 percent increase) and from \$78.572 million in 2018 to \$110.209 million in 2021 in Tennessee (a 40.3 percent increase) (Figure 5 and Figure 6).

This growth is further confirmed by the optimism shown by survey respondents. As shown in Figure 7, over 84 percent of survey respondents expected growth in sales of at least 5 percent in 2022 with only one respondent indicating a decline in sales. The average across all respondents is a 14.6 percent expected increase in sales.

The growth in the number of establishments across 53 states, including the District of Columbia and US territories from 2018 through the first quarter (q1) of 2022 (US Department of Labor) was compared. As shown in Table 1, Tennessee ranked 11th in the number of establishments in 2022 and 26th in growth in the number of establishments from 2018 through q1 2022. Accordingly, the Tennessee industry showed a growth pattern consistent with the national average.

A comparison in terms of employment and wages showed an even more prominent national presence for the Tennessee distilling industry (US Department of Labor). Across all 53 states, territories and DC, Tennessee ranked second in both employment and wages in 2021 (Table 2, Table 3). In terms of growth, Tennessee ranked 19th in the level of job growth and 24th in the level of wage growth from 2018 through 2021.

Location

Twenty-three of the 95 Tennessee counties had at least one reporting distillery in q1 2022 (Table 4). In terms of number of operations, the industry is concentrated in Davidson and Sevier Counties with 13 and 12 establishments, respectively, together accounting for 42.8 percent of the 59 reporting establishments in the first quarter of 2022. As of March 2022, distilleries in Sevier County were responsible for 47.8 percent of reported employment for the state (1,064 out of 2,227 jobs) and 30.6 percent of total quarterly wages (\$8.630 million out of \$28.258 million) (US Department of Labor). Other counties with larger than average

number of establishments included Cocke (4), Hamilton (3), and Williamson (3). Davidson County has experienced a growth spurt in the number of establishments from six in 2020 to 10 in 2021 to 13 in the first quarter of 2022. In 2021 and 2022, Davidson County was responsible for most of the growth in the Tennessee distilling industry in terms of number establishments. However, because of Jack Daniel, production remains concentrated in Moore County.

Tax revenue contribution

Distilled spirits make a substantial contribution to tax revenue in Tennessee. As shown in Figure 8, revenues from the mix drink tax have grown from over \$55 million in fiscal year 2010 to over \$108 million in fiscal year 2021, while revenues from the alcoholic beverage tax have grown from over \$46 million to over \$85 million in the same period. If we remove the effects of general inflation, the former has increased by 58.98 percent in real terms (\$88.128 million in real or inflation-removed dollars), while the latter has increased by 49.63 percent in real terms (\$69.340 million real dollars). While these tax revenues are generated regardless of where the spirits are produced, the data still demonstrates a strong contribution by the Tennessee industry to state tax revenues. Likewise, federal tax revenues from the sale of distilled spirits at the national level have also increased from \$3.1 billion in 2003 to \$4.8 billion in 2021 (Figure 9). If we remove the effect of general inflation, federal spirits tax revenues are \$3.4 billion in real dollar terms, an increase of 7.92 percent over the 2003 level. These impact analysis results provide an estimate of the contribution (direct and indirect) of the Tennessee distilling industry on federal and state-local tax revenues.

Tourism and tours

All distilleries that responded to the survey indicated that out-of-state tourists making visits to their facilities were an important market segment to capture. As discussed in the location section, 13 establishments in Davidson County and 12 in Sevier County reinforces this point. In response to the question, “the primary reason out of state visitors came to Tennessee was to visit this facility,” 14.3 percent of respondents strongly disagreed and 35.7 percent disagreed with the statement, while 21.4 percent were unsure, 28.6 percent agreed and none strongly agreed (Figure 10). The largely negative response to the statement implies that respondents suspect out-of-state visitors are, in general, not drawn to Tennessee because of the distilling industry, but rather see visiting, touring and making direct purchases at a Tennessee distillery as something fun and interesting to do. These results indicate that the Tennessee Department of Tourist Development and regional and local tourism promotion groups should involve the industry in their tourism promotion efforts.

All of the 11 distilleries responding to the question provide tours. The average number of visitors was 134,818 and the median was 25,000. Among 12 respondents, 11 distilleries indicated they provided paid for product samples, and one provided free product samples.

Foreign trade

The contribution of the Tennessee distilling industry to US foreign exports for 2022 through June 2022 is provided in Figure 11. The industry makes a major contribution to US distilled spirits exports, in fact the largest among all states at \$614.1 million in 2021 (US Census Bureau, 2022). The level of exports showed a general growth trend from 2002 through 2014 where exports were valued at \$721.25 million. US trade policy had a detrimental impact in subsequent years (with reaction tariffs imposed by European and the Chinese markets on US distilled spirits shipments), but exports in 2021 and to date in 2022 have returned to levels consistent with earlier values.

An analysis of where Tennessee spirits were shipped in 2021 is provided in Figure 12 and Figure 13. The Netherlands (\$92.006 million), France (\$67.525 million), Germany, Latvia and Japan were the most important markets (Figure 12). The importance of the European market is also shown in Figure 13, where 68 percent of Tennessee spirits exports were shipped in 2021.

Input-output model

Input-output models “examine the market flow of products between industries, sales by industries to households and other final users, and industry use of factors of production (labor and capital). Such models can be very detailed, containing several hundred industries” (Hughes, 2003). An IMPLAN-based model of the Tennessee economy in 2019 was used as the starting point of our work. (IMPLAN is a so-called “ready-made I-O modeling system, where a basic knowledge of personal computers is sufficient for generating models, multipliers, and impacts” (Hughes, 2003)).

Model coefficients were modified based on a survey of Tennessee distillers and the author’s knowledge of such models and the Tennessee economy. For example, the level of and source (in state or out of state) of grain used by the industry was modified based on the survey data, as was level of industry output and employment. Survey estimates were also used in determining levels of industry activity in restaurant, bar, retail sales and impact of distillers’ grains provided to farmers as animal feed based on profitability analysis conducted by Best (2019) and transportation estimates from Hart (2007). In some cases, outside information was used to confirm model coefficients and estimates. For example, the analysis of proprietary distillery business data provided by the firm Industrious CFO (2022) indicates that the typical distillery is a relatively profitable business venture (at least in the top 20 percent across the various types of US businesses). The distilling industry profit estimates developed from this model are in line with those provided by Industrious.

Industry spending patterns as provided in Table 7 show that other property income is the largest “cost” item at 21.98 percent of total revenue, followed by taxes on production and imports at 12.46 percent, distilleries at 3.83 percent, various forms of wholesale

activities and grain purchases at 4.03 percent. Based on survey results, an estimated 28.65% of grain is purchased from Tennessee farmers. These spending patterns determine the degree to which spending by the industry multiplies throughout the state economy (the more in-state spending, the greater the multiplier in this case).

Input-output models are most widely used in estimating economic multiplier-based impact analysis for industries or for a given economic event. In this case, we estimate the contribution of the Tennessee Distilling Industry (North American Industry Classification System (NAICS) 312140) to the state economy. A contribution study such as this one is based on the assumptions tied to an industry shutdown scenario (i.e., disappearance) without subsequently freed resources finding alternative in-state uses (for example, a situation where displaced distillery workers would leave the state for employment elsewhere). Also, the model is based on “the fixed relative prices” assumption (Miller and Blair, 2022), which means, for example, if distillery workers lost their jobs, wage rates in the state would not be affected.

Economic impact results

Direct industry spending and revenue estimates are used in our Tennessee input-output model to generate contribution analysis for the Tennessee distilling industry (total economic impact direct and multiplier based). Based on industry survey data, the original input-output model and a variety of other sources of information, the industry is directly responsible for an estimated 2,990 jobs, \$2.01 billion in sales, \$180.838 million in personal income and \$864.556 million in gross state product (Figure 14 through Figure 17). By applying those values in the model, the total (direct and multiplier effect) estimated contribution to the state economy is \$3.135 billion dollars in output, 8,635 jobs, almost \$524 million in personal income and \$1.456 billion in gross state product. A dollar in industry sales generates \$1.56 in state economic activity, and a dollar in industry gross regional product generates \$1.68 in gross regional product throughout the state; an industry job leads to 2.89 jobs in the state. These results demonstrate that the Tennessee distilling industry is a major contributor to the state economy.

The Tennessee distilling industry also makes a major contribution to local and state governments tax revenues and to federal tax revenue. Based on the analysis, economic activity generated by Tennessee distilleries lead to an estimated \$284.866 million in state and local tax revenue and \$155.933 million in federal tax revenues.

Detailed selected sectors regarding the economic impact show that this impact is spread throughout numerous industries and all parts of the state (Figure 18 through Figure 21). In terms of employment impacts, other impacts were concentrated in wholesale activities (other nondurable goods at 601 jobs and machinery, equipment and supplies wholesale at 221 jobs), truck transportation (299 jobs), grain farming (246 jobs), real estate (244 jobs) and management of companies and enterprises (183), among others (Figure 18). Labor income was concentrated in wholesale activities (nondurable goods at \$48.605 million and machinery, etc., at \$19.727 million), trucking (\$19.783 million), health care (reflecting spending by workers) at over \$14 million for hospitals and over \$9 million for physicians, and insurance (\$8.527 million) (Figure 19). Likewise, major impacts in terms of gross regional product included wholesale (nondurable goods at \$109.740 million and machinery, etc., at \$37.678 million), housing (owner-occupied dwellings at \$27.290 million) and banking (monetary authorities and depository credit intermediaries at \$11.968 million) (Figure 20). In terms of output, relatively large amounts of activity were seen in the two wholesale sectors, housing, real estate (at \$50.713 million), trucking (\$47.701 million) and insurance (\$31.070 million) (Figure 21).

Summary and conclusions

This report provided an analysis of the contribution of the Tennessee distilling industry to the state economy. The recent dramatic growth in the industry is documented and evaluated. The economic contribution is seen in various locations and economic sectors spread throughout Tennessee. The direct and total economic impact is substantial in terms of output, employment, labor income and gross regional product, as well as in terms of state-local and federal tax revenue that is generated by the industry.

¹Other property income consists of payments for rents, royalties, dividends and corporate profits. Although it is generally a measure of profitability, it is included in cost items to account for all industry outlays (MIG, 1999).² Gross regional product (GRP) is activity generated by the Tennessee economy as measured by returns to factors of production (labor and capital). It is analogous to gross domestic product (GDP) for the US economy.³Activities by distilleries was primarily assigned to the distillery sector but also — to a much lesser extent — to general retail merchandising (gift shops), promoters of performing arts (tours), full-service restaurants and all other food and drinking places (bars), based on survey data regarding share of employment and sales in these non-distillery sectors. Hence the totals for the distilling industry (in Figure 14 and Figure 15) are greater than the values presented in Figure 18 through Figure 21. Direct activity was also assigned to truck transportation and to farm income as positive impacts and to reductions in animal feed sector activities as a negative impact to account for the economic impact of farmer use of distillers' grains.
