International Agricultural Trade Research Consortium
December 12, 2021

Introduction

How has COVID affected U.S. trade in food and agricultural products?

- ▶ How did COVID (illnesses and deaths) affect trade in 2020?
- ▶ How did COVID mitigation measures (government restrictions on activity) affect trade in 2020?
- ▶ How did individual mobility (a proxy for commercial activity) affect trade in 2020?

How has COVID affected U.S. trade in food and agricultural products?

- ▶ How did COVID (illnesses and deaths) affect trade in 2020?
- ▶ How did COVID mitigation measures (government restrictions on activity) affect trade in 2020?
- ▶ How did individual mobility (a proxy for commercial activity) affect trade in 2020?
- ▶ Analyze impacts of COVID on imports and exports of 701 commodities, 61 U.S. trading partners

How has COVID affected U.S. trade in food and agricultural products?

- ▶ How did COVID (illnesses and deaths) affect trade in 2020?
- ▶ How did COVID mitigation measures (government restrictions on activity) affect trade in 2020?
- ▶ How did individual mobility (a proxy for commercial activity) affect trade in 2020?
- ▶ Analyze impacts of COVID on imports and exports of 701 commodities, 61 U.S. trading partners
- ▶ Key takeaway: Preliminary results show very little impact

- ▶ U.S. Census Bureau:
 - ▶ Monthly data on trade flows (total value and volume; by air; by sea)
 - ▶ Import and export data for U.S. trade with all partners
 - ▶ Available at the port level
 - ▶ Available at the HS6 code. Examples:
 - ▶ 070410: Cauliflower and headed broccoli, fresh or chilled
 - ▶ 070420: Brussels sprouts, fresh or chilled
 - ▶ 070490: Edible brassicas (cabbages etc) NESOI, fresh or chilled
 - ▶ Note: in this analysis, we only use data on import and export values (not volume)

Summary data visualizations

Import value by region, 2020, major ports

Export value by region, 2020, major ports

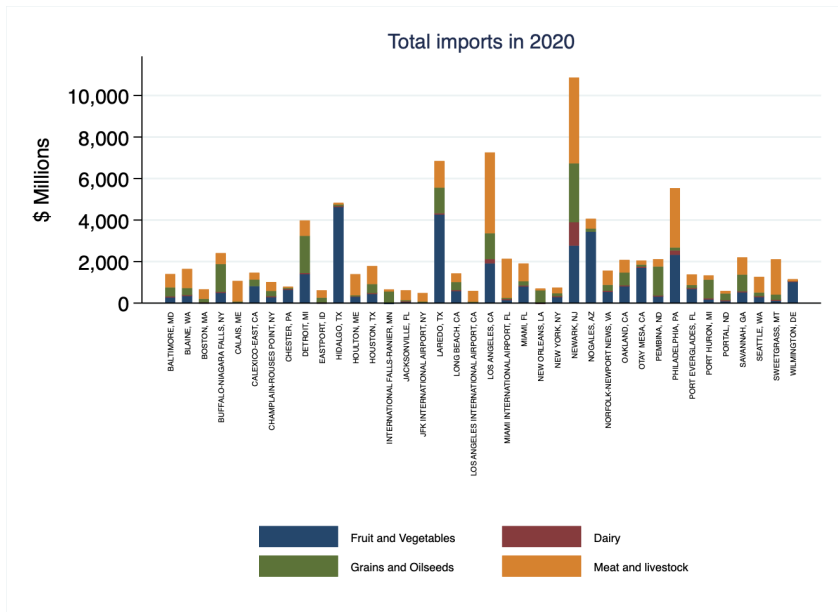

Total exports in 2020

Import value by sector, 2019, major ports

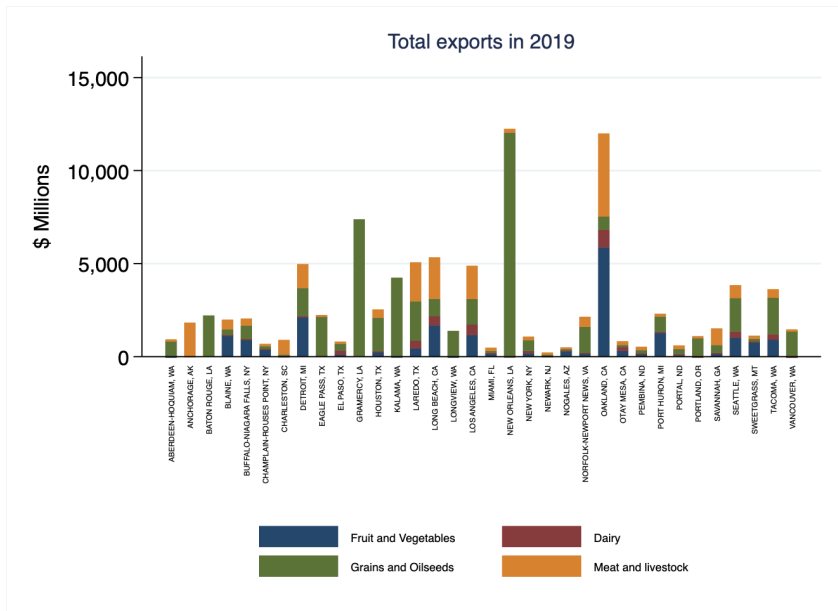

Import value by sector, 2020, major ports

Export value by sector, 2019, major ports

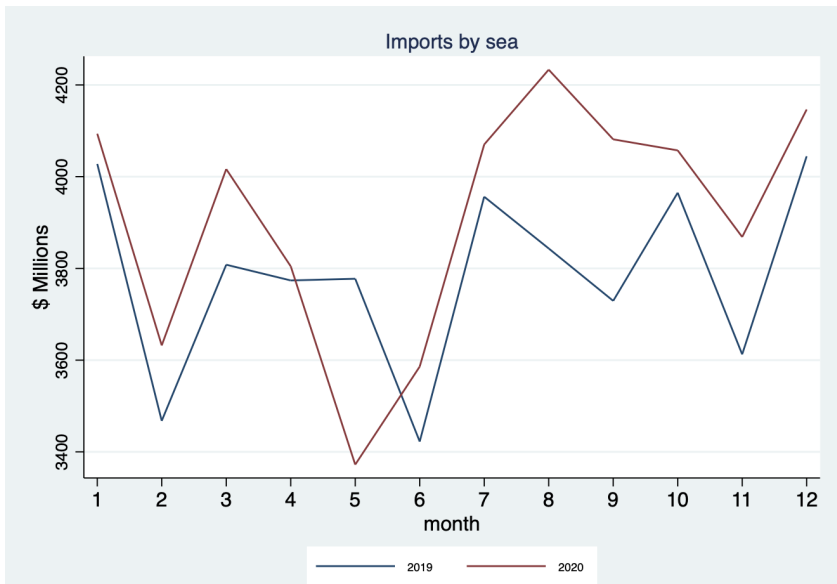

Export value by sector, 2020, major ports

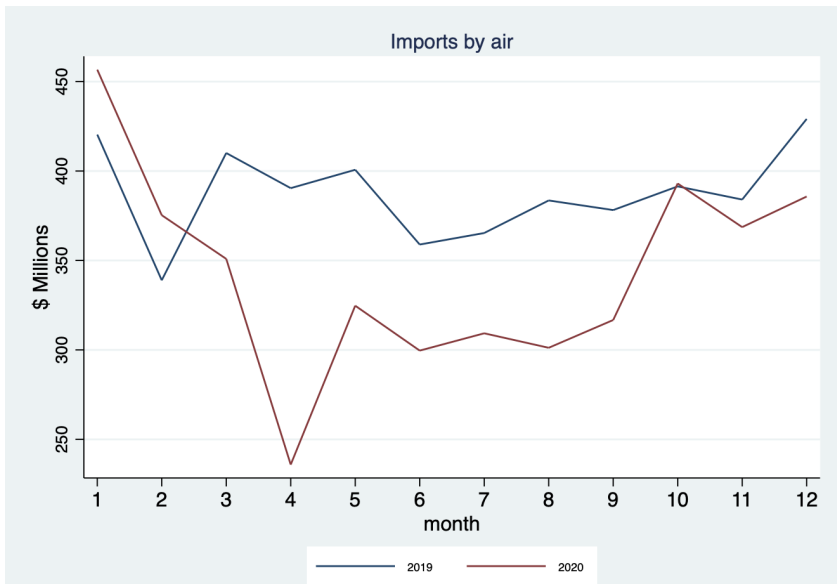

Import value, all commodities and ports, 2019 and 2020

Import value, all commodities and ports (by sea), 2019 and 2020

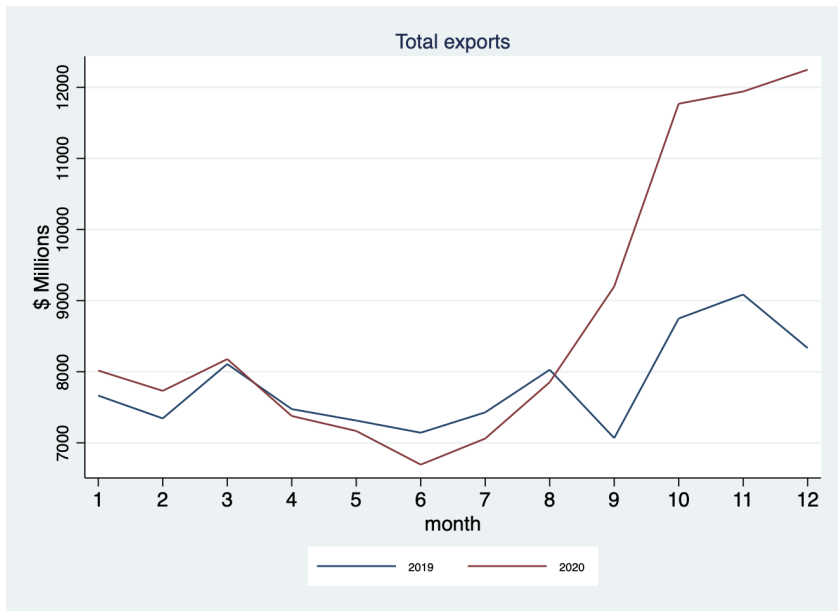

Import value, all commodities and ports (by air), 2019 and 2020

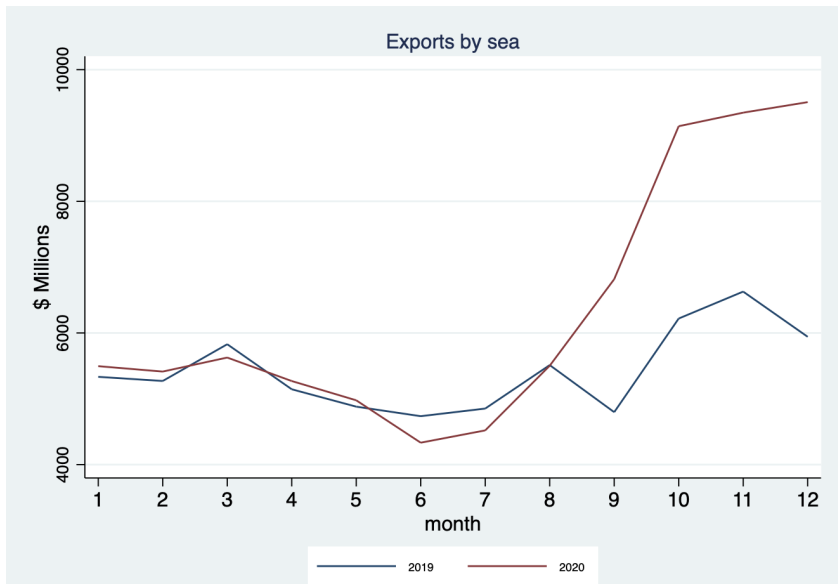

Import value, all commodities and ports (by sector), 2019 and 2020

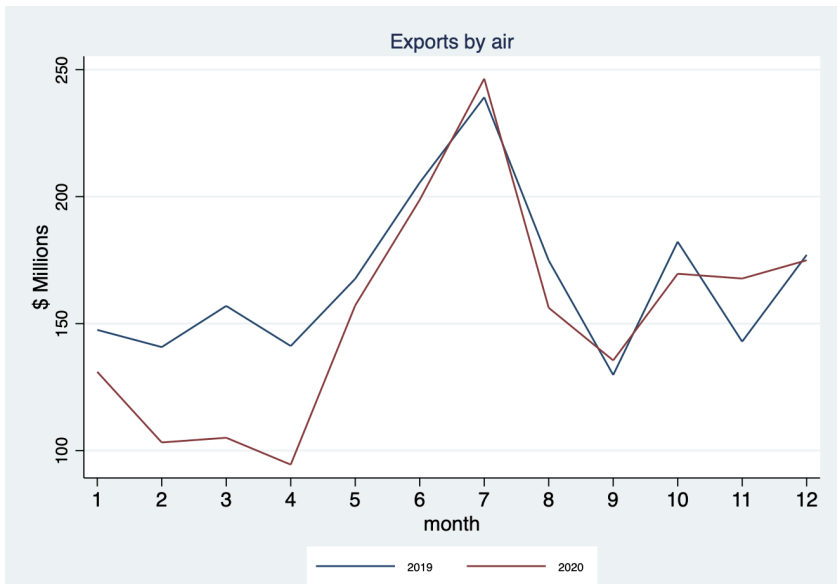

Export value, all commodities and ports, 2019 and 2020

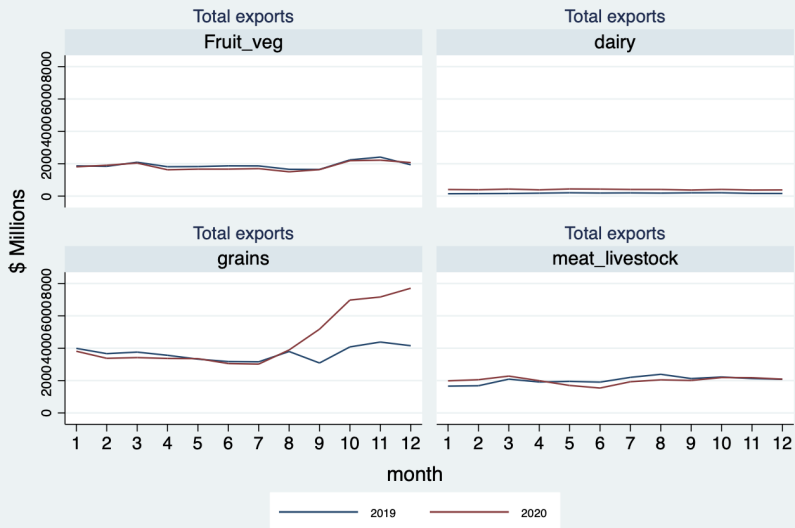

Export value, all commodities and ports (by sea), 2019 and 2020

Export value, all commodities and ports (by air), 2019 and 2020

Export value, all commodities and ports (by sector), 2019 and 2020

Summary of graphical evidence

- ▶ Very little evidence of decreased trade in 2020 relative to 2019
- ▶ Were the decreases (variations) driven by COVID-related shocks?

Concurrent research

- ▶ Arita, Grant, Sydow, Beckman (*Food Policy*, forthcoming)
- ▶ VT Trade Center in collaboration with USDA
- ▶ Finding: COVID deaths, government restrictions, and mobility decreased *global* agricultural trade by 5 to 10 percent in 2020

Empirical strategy

- ▶ Very little change in value of imports and exports from 2019 to 2020
- ▶ Where there was variation, was it driven directly by COVID?
- ▶ In other words, how much of the (admittedly small) variation in trade across 2019 and 2020 can be explained by:
 - ▶ COVID illnesses and deaths?
 - ▶ Government mitigation policies?
 - ▶ Personal mobility choices?
- ▶ Each of these types of *shocks* may be related to changes in demand or supply
- ▶ Model depends on the assumption that COVID-related shocks cause changes in imports and exports; not the other way around

- ▶ We exploit variation in:
 - ▶ County-level COVID illnesses and deaths for port counties, within the United States
 - ▶ Country-level COVID illnesses and deaths for trade partners
 - ▶ State-level personal mobility (data from Google)
 - ▶ Country-level personal mobility (data from Google) for trade partners
 - ▶ State-level mitigation strategies (University of Oxford database)
 - ▶ Country-level mitigation strategies for trade partners (Oxford)

- ▶ We also control for fixed effects
 - ▶ Port-partner-commodity-month (to focus on variation in the shock variables across years)
 - ▶ Port-partner-commodity and commodity-month (slightly more flexible: focuses in variation across months and across port-partner pairs)

- ▶ Poisson pseudo-maximum likelihood estimation (w/ HD FEs; Santos Silva and Tenreyro 2006; Correira et al. 2019) to properly characterize the asymmetric distribution of import and export values (with lots of zeros)
- ▶ Port-partner-commodity fixed effects control for time-invariant trade patterns
- ▶ Estimating equations:

$$x_{ipkmy} = \exp\{\mathbf{X}_{imy}\beta_1 + \mathbf{X}_{pmy}\beta_2 + u_{ipkm}\} + \varepsilon_{ipkmy} \quad (1)$$

$$m_{ipkmy} = \exp\{\mathbf{X}_{imy}\beta_1 + \mathbf{X}_{pmy}\beta_2 + u_{ipkm}\} + \varepsilon_{ipkmy} \quad (2)$$

where \mathbf{X} includes all covid illness, death, mitigation, and mobility variables for trade partner i and U.S. port p

Findings

- ▶ Essentially no economically important effects of COVID illnesses and deaths, government mitigation measures, or personal mobility on value of trade at the port-partner-commodity level

- ▶ Essentially no economically important effects of COVID illnesses and deaths, government mitigation measures, or personal mobility on value of trade at the port-partner-commodity level
- ▶ What do we mean by “no economically important effects”?

- ▶ Essentially no economically important effects of COVID illnesses and deaths, government mitigation measures, or personal mobility on value of trade at the port-partner-commodity level
- ▶ What do we mean by “no economically important effects”?
 - ▶ Precisely estimated trivial effects

Findings: details (effects of COVID variables in U.S. port counties and states)

- ▶ Peak COVID illnesses *increased* imports by sea at the port-partner-commodity level by \$1.17 per month ($p < 0.001$) and *decreased* imports by air by \$0.24 per month ($p < 0.001$)

Findings: details (effects of COVID variables in U.S. port counties and states)

- ▶ Peak COVID illnesses *increased* imports by sea at the port-partner-commodity level by \$1.17 per month ($p < 0.001$) and *decreased* imports by air by \$0.24 per month ($p < 0.001$)
- ▶ Peak COVID illnesses in the United States *increased* exports at the port-partner-commodity level by \$0.42 per month ($p < 0.001$)
 - ▶ Similar effect sizes (and p -values) when looking at exports by air and sea alone
- ▶ Port-partner-commodity-month-of-year fixed effects

Findings: details (effects of COVID variables in U.S. port counties and states)

- ▶ COVID deaths in the United States had no effect on imports (main specifications) or total exports; decreased exports by air by \$2.40 per month ($p < 0.001$)

Findings: details (effects of COVID variables in U.S. port counties and states)

- ▶ COVID deaths in the United States had no effect on imports (main specifications) or total exports; decreased exports by air by \$2.40 per month ($p < 0.001$)
- ▶ U.S. “lockdowns” decreased imports by up to \$0.19 per month ($p < 0.001$) and decreased exports by up to \$0.27 per month ($p = 0.013$)

Findings: details (effects of COVID variables in U.S. port counties and states)

- ▶ COVID deaths in the United States had no effect on imports (main specifications) or total exports; decreased exports by air by \$2.40 per month ($p < 0.001$)
- ▶ U.S. “lockdowns” decreased imports by up to \$0.19 per month ($p < 0.001$) and decreased exports by up to \$0.27 per month ($p = 0.013$)
- ▶ Maximum reductions in retail and workplace mobility (64%) decreased imports by \$0.21 per month and increased exports by \$0.56 per month
- ▶ All results at the port-partner-commodity level; port-partner-commodity-month-of-year fixed effects

Findings: details (effects of COVID variables in trade partner countries)

- ▶ COVID cases in trade partner countries had no effects on U.S. imports or exports (main specifications)
- ▶ COVID deaths in trade partner countries increased U.S. imports by up to \$0.17 per month ($p = 0.001$) and decreased U.S. exports by up to \$0.01 per month ($p = 0.061$)

Findings: details (effects of COVID variables in trade partner countries)

- ▶ COVID cases in trade partner countries had no effects on U.S. imports or exports (main specifications)
- ▶ COVID deaths in trade partner countries increased U.S. imports by up to \$0.17 per month ($p = 0.001$) and decreased U.S. exports by up to \$0.01 per month ($p = 0.061$)
- ▶ Lockdowns in trade partner countries decreased U.S. imports by up to \$0.21 per month ($p < 0.001$) and decreased U.S. exports by up to \$0.19 per month ($p = 0.006$)

Findings: details (effects of COVID variables in trade partner countries)

- ▶ COVID cases in trade partner countries had no effects on U.S. imports or exports (main specifications)
- ▶ COVID deaths in trade partner countries increased U.S. imports by up to \$0.17 per month ($p = 0.001$) and decreased U.S. exports by up to \$0.01 per month ($p = 0.061$)
- ▶ Lockdowns in trade partner countries decreased U.S. imports by up to \$0.21 per month ($p < 0.001$) and decreased U.S. exports by up to \$0.19 per month ($p = 0.006$)
- ▶ Maximum reductions in retail and workplace mobility in trade partner countries decreased U.S. imports by \$0.79 per month and decreased U.S. exports by \$0.19 per month
- ▶ All results at the port-partner-commodity level; port-partner-commodity-month-of-year fixed effects

Findings: additional discussion

- ▶ Results are similar whether or not we include China, Cuba, Dominican Republic, Iceland, Tunisia (no mobility data)

Findings: additional discussion

- ▶ Results are similar whether or not we include China, Cuba, Dominican Republic, Iceland, Tunisia (no mobility data)
- ▶ Results are similar if we use port-partner-commodity and commodity-month-of-year fixed effects

Findings: additional discussion

- ▶ Results are similar whether or not we include China, Cuba, Dominican Republic, Iceland, Tunisia (no mobility data)
- ▶ Results are similar if we use port-partner-commodity and commodity-month-of-year fixed effects
- ▶ Results are similar if we restrict to non-zero observations or economically important ports (defined as those that account for at least 90% of trade value)

Findings: additional discussion

- ▶ Results are similar whether or not we include China, Cuba, Dominican Republic, Iceland, Tunisia (no mobility data)
- ▶ Results are similar if we use port-partner-commodity and commodity-month-of-year fixed effects
- ▶ Results are similar if we restrict to non-zero observations or economically important ports (defined as those that account for at least 90% of trade value)
- ▶ Very limited number of economically meaningful effects when analyzing results for individual 4-digit commodities
 - ▶ Cherry picking

Findings: additional discussion

- ▶ Results are similar whether or not we include China, Cuba, Dominican Republic, Iceland, Tunisia (no mobility data)
- ▶ Results are similar if we use port-partner-commodity and commodity-month-of-year fixed effects
- ▶ Results are similar if we restrict to non-zero observations or economically important ports (defined as those that account for at least 90% of trade value)
- ▶ Very limited number of economically meaningful effects when analyzing results for individual 4-digit commodities
 - ▶ Cherry picking
- ▶ We find that U.S. imports and exports were impacted by no more than 0.01 percent (cf. Arita et al., 5–10 percent)

Next steps

Next steps

- ▶ Extend data to 2021

Next steps

- ▶ Extend data to 2021
- ▶ Gather additional data on other food and agricultural commodities and non-agricultural commodities

Next steps

- ▶ Extend data to 2021
- ▶ Gather additional data on other food and agricultural commodities and non-agricultural commodities
- ▶ Analyze whether COVID affected trade in highly differentiated goods; bulk, intermediate, or consumer goods

Next steps

- ▶ Extend data to 2021
- ▶ Gather additional data on other food and agricultural commodities and non-agricultural commodities
- ▶ Analyze whether COVID affected trade in highly differentiated goods; bulk, intermediate, or consumer goods
- ▶ Analyze how COVID affected the volume of trade (and the price of traded goods)

Next steps

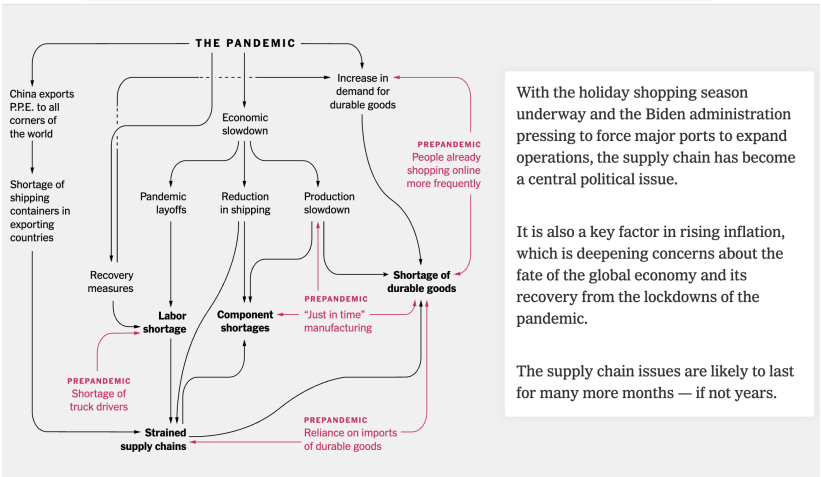

- ▶ Extend data to 2021
- ▶ Gather additional data on other food and agricultural commodities and non-agricultural commodities
- ▶ Analyze whether COVID affected trade in highly differentiated goods; bulk, intermediate, or consumer goods
- ▶ Analyze how COVID affected the volume of trade (and the price of traded goods)
- ▶ Investigate how port specialization (e.g., Pacific v. Atlantic trade partners) may have affected the flow of goods

Next steps

- ▶ Extend data to 2021
- ▶ Gather additional data on other food and agricultural commodities and non-agricultural commodities
- ▶ Analyze whether COVID affected trade in highly differentiated goods; bulk, intermediate, or consumer goods
- ▶ Analyze how COVID affected the volume of trade (and the price of traded goods)
- ▶ Investigate how port specialization (e.g., Pacific v. Atlantic trade partners) may have affected the flow of goods
- ▶ Analyze other mechanisms for indirect impacts of COVID on trade (e.g., increased price of shipments, changes in U.S. employment, and financial relief programs)

Indirect effects of COVID

nytimes.com/interactive/2021/12/05/business/economy/supply-chain.html?searchResultPosition=2

With the holiday shopping season underway and the Biden administration pressing to force major ports to expand operations, the supply chain has become a central political issue.

It is also a key factor in rising inflation, which is deepening concerns about the fate of the global economy and its recovery from the lockdowns of the pandemic.

The supply chain issues are likely to last for many more months — if not years.
