# A perfect or persistent storm for global agricultural markets? High energy prices and the war in Ukraine

Christian Elleby, Ignacio Pérez Dominguez, Giampiero Genovese, Wyatt Thompson, Marcel Adenauer and Hubertus Gay

IATRC Annual Meeting 12/12-2022, Clearwater Beach, FL

#### Run-up in commodity prices prior to the Russian invasion of Ukraine in Feb 2022

#### Scenarios: High input costs and supply disruptions

#### Main scenario

- Persistent increase in energy and fertilizer prices (↑ 66% compared to the 2021 baseline)
- Lower UKR export supply of wheat ( $\downarrow$  50% = 11.7Mt), coarse grains ( $\downarrow$  40% = 15.7Mt), and soybeans ( $\downarrow$  30% = 0.6Mt).
- Reduced UKR export supply of wheat (↓ 15% = 6.7Mt). Other exports fixed at the 2021 baseline

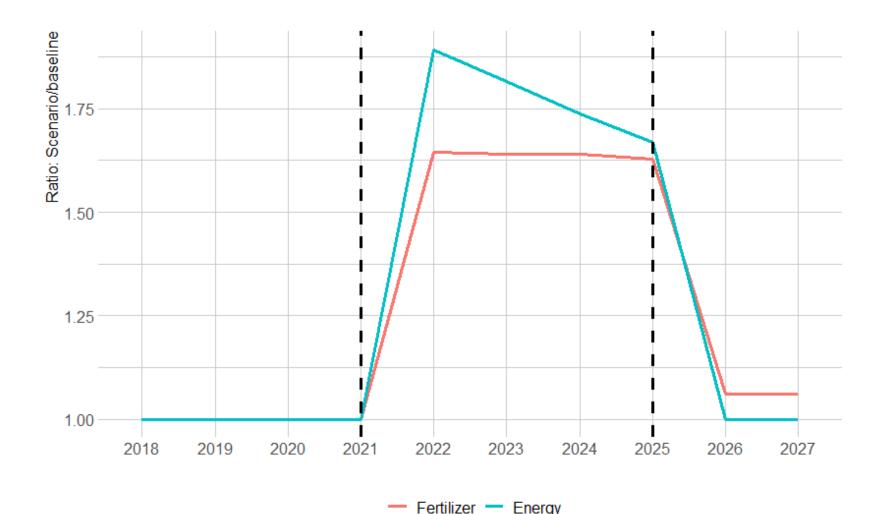

#### Additional scenarios

- Additional crop area in the EU (+1.6 Mha) and US (+0.5 Mha) due to a transitional derogation of ecological set-aside
- Endogenous Russian export supply and no wheat export shock

We focus on 2025/26 marketing year. Scenario shocks applied to 2022-2025

### Illustration of the energy and fertilizer shocks

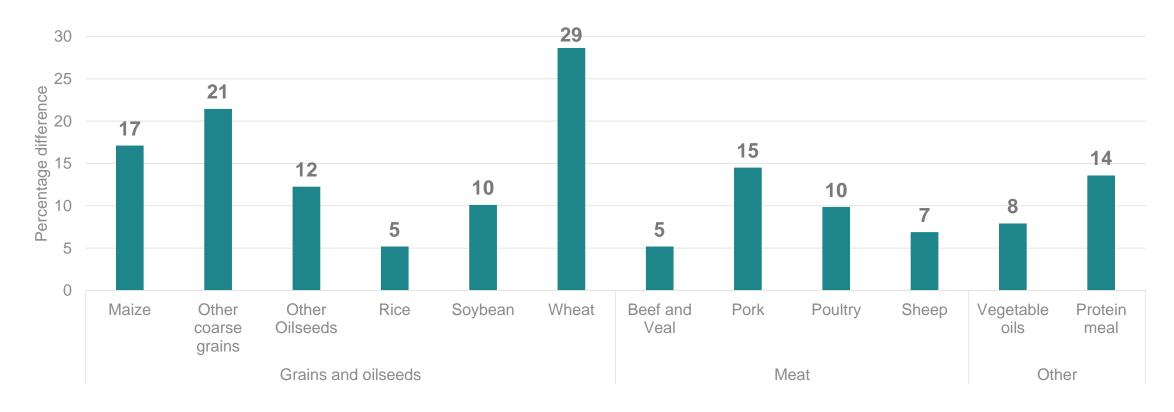

#### The Aglink-Cosimo model

- Large-scale recursive-dynamic partial equilibrium model of the global agri-food markets incl. biofuels
- Managed by the Secretariats of the OECD and FAO. JRC a key collaborator
- Used in connection with the OECD-FAO Global Agricultural Outlook and the EU Agricultural Outlook baseline projections
- Homogenous goods, each country trades with the world market
- ~90 commodities, 39 world market-clearing prices, all main producers/exporters
- Energy (Brent) and fertilizer prices important inputs in the production cost index

## Substantial price impacts on the world market. Energy and fertilizer price shock contribute appr. 30-50% to the total impact (50-70% from lower exports)

Impacts in percentage difference between scenario and baseline after three years of conflict. Main scenario

## Comparison of world price impacts across scenarios: Wheat price response sensitive to the assumptions regarding RUS exports

|                     | Scen1 | Scen2 | Scen3 |
|---------------------|-------|-------|-------|
| Maize               | 17.1  | 16.0  | 16.1  |
| Other coarse grains | 21.4  | 18.6  | 18.2  |
| Soybean             | 10.1  | 9.1   | 9.6   |
| Wheat               | 28.6  | 26.3  | 22.1  |
| Other Oilseeds      | 12.3  | 11.2  | 10.9  |
| Protein Meal        | 13.6  | 12.2  | 12.8  |
| Vegetable oils      | 7.9   | 7.4   | 7.6   |

Impacts in percentage difference between scenario and baseline after three years of conflict. Scen1: same as above. Scen2: Scen1 + additional farm land in EU and US. Scen3: Scen1 + endogenous export response in Russia.

Dom. producer price response depends on level of protection and the trade position. Margins reduce pass-through from producer to consumer

prices

Price impacts in percentage difference between scenario and baseline after three years of conflict. PP: Producer prices. CP: Consumer prices. Main scenario

Note: Impacts in Mt. Difference between scenario and baseline exports after three years of conflict. Main scenario

### Modest food security impacts in the MENA region

Impacts in percentage difference between scenario and baseline after three years of conflict. Main scenario

#### Conclusions

- 1. Energy, fertilizer and ag. prices started to increase well before the Russian invasion of Ukraine. The supply disruptions drove prices further up. Higher input costs and lower grain export supply → substantial effect on world prices of especially wheat, coarse grains, protein meal. Derived meat, dairy, biofuel impacts. Energy and fertilizer price shock contribute appr. 30-50 percent to total world market price impacts in the main scenario depending on the commodity
- 2. Lower grain export supply from UKR and RUS to a large extent compensated by grain from other sources. Seemingly modest food security impacts, but Aglink-Cosimo is not well suited for distributional impact analysis
- 3. The additional crop area in the EU and US resulting from temporary land use policies have marginal effects on price impacts. Worth the negative environmental impacts?
