# **Are commodity exports a road to weaker institutions? Causal inference through a natural experiment**

Victor Lana, Lorena Costa, Leonardo Bornacki

Department of Agricultural Economics - University of Vicosa, Brazil

Dec 10, 2023

# Introduction

- Researchers have investigated how institutions could affect long-term growth
- But we wanted to take one step back and try and understand the determinants of institutions

**Colonial heritage**

**Climate**

**Trade openness**

**Resource  
endowments**

# Introduction

- We also know that resource-rich countries tend to export relatively more agricultural products
- Then we argued whether the relationship between **resource endowments** and **institutions** would also hold for the association between **agricultural exports** and **institutional quality**

To investigate the causal effect of commodity exports on the institutional quality of a set of 49 countries between 1997 and 2022.

## Identification strategy

- Endogeneity → Therefore, it is crucial to search for exogenous natural variations in commodity product exports in combination with econometric modeling techniques
- We use the accession of China to the WTO as a natural experiment to study the relationship between agricultural exports and institutions

# Identification strategy

The accession of China to the WTO means that its imports would all face the same tariffs and barriers to trade

As a result, each country's commerce with China would be a reflex of its comparative advantages, not its political power (Chen, 2009)

Figure 1. Aggregate commodity exports for full sample, developed, and developing countries between 1997 and 2022. Source: Own calculations.

## Empirical strategy

- Our model is:

$$Inst_{it} = \alpha_0 + \alpha_1 \ln X_{it} + \sum \beta V + \varepsilon_{it}$$

- IV approach through the 2SLS. The first- and second-stage econometric models follow:

**Exclusion restriction!**

$$\ln X_{it} = \lambda_0 + \lambda_1 \ln chinaM_t + \sum \eta V + v_{it}$$

$$Inst_{it} = \alpha_0 + \alpha_1 \ln \hat{X}_{it} + \sum \beta V + \varepsilon_{it}$$

# Data

- Institutional quality – **World Bank WGI**
  - Voice and accountability; political stability and absence of violence; government effectiveness; regulatory quality; rule of law; and control of corruption
- Agricultural exports – **WITS**
- GDP, gini index, arable land, CO2 emissions, fertilizer consumption, R&D expenditure, and resource rent – **World Bank**
- Latitude and landlocked dummy – **CEPII**

# Results

Table 1. Mean values of variables for countries that are more (or less) intensive in the exports of commodity goods

| Variables                                     | Net exporter of commodities? |          | Higher share of agricultural exports? |          |
|---|------------------------------|----------|---------------------------------------|----------|
|   | Yes                          | No       | Yes                                   | No       |
| Voice and Accountability                      | 0.58***                      | 0.75     | 0.59***                               | 0.74     |

# Results

We rely the results of the identification and weak instrument tests, which confirm that that the Chinese demand shock serves as a relevant, strong instrument in our analysis.

Note: Robust standard errors in parentheses. \*\*\*p<0.01, \*\*p<0.05, \*p<0.1, and NS non-significant. Exports in log. Control variables are natural resources rents; log of per capita GDP; latitude, and the landlocked dummy. Figures rounded to four decimal places.

## Concluding remarks

- We underscore the far-reaching **impact** of variations in agricultural exports on a country's institutional landscape.
- Policymakers in commodity-exporting countries should be conscious of the potential **trade-offs** between economic gains from exports and the quality of their institutions

## Concluding remarks

- While resource exports can boost revenues, they may also lead to institutional deterioration, affecting governance, public services, and political stability
- Thus, governments might consider the adoption of measures to mitigate these adverse effects, such as transparent revenue management, diversification of their economies, and robust regulatory frameworks
- **Cattle farming**, for instance, requires special attention due to its resource-intensive nature and the lobbying power of producer groups. Conversely, **vegetable exports** may warrant more relaxed regulation.
