This paper

We investigate the dynamics and external drivers of post-2020 food inflation patterns in Europe and quantify the contribution of different components.

Key results:

- ✓ Food price inflation has been mainly driven by changes in the input price index
- ✓ Energy price inflation has been an important driver
- ✓ Weather variations explain little the changes in real food price inflation in the EU
- ❑ Marked differences are observed across sectors.
- ❑ For F&Vs the international price has driven the most the price inflation.
- ❑ Trade openness has been an important driver for cereals, oilseeds, and sugar

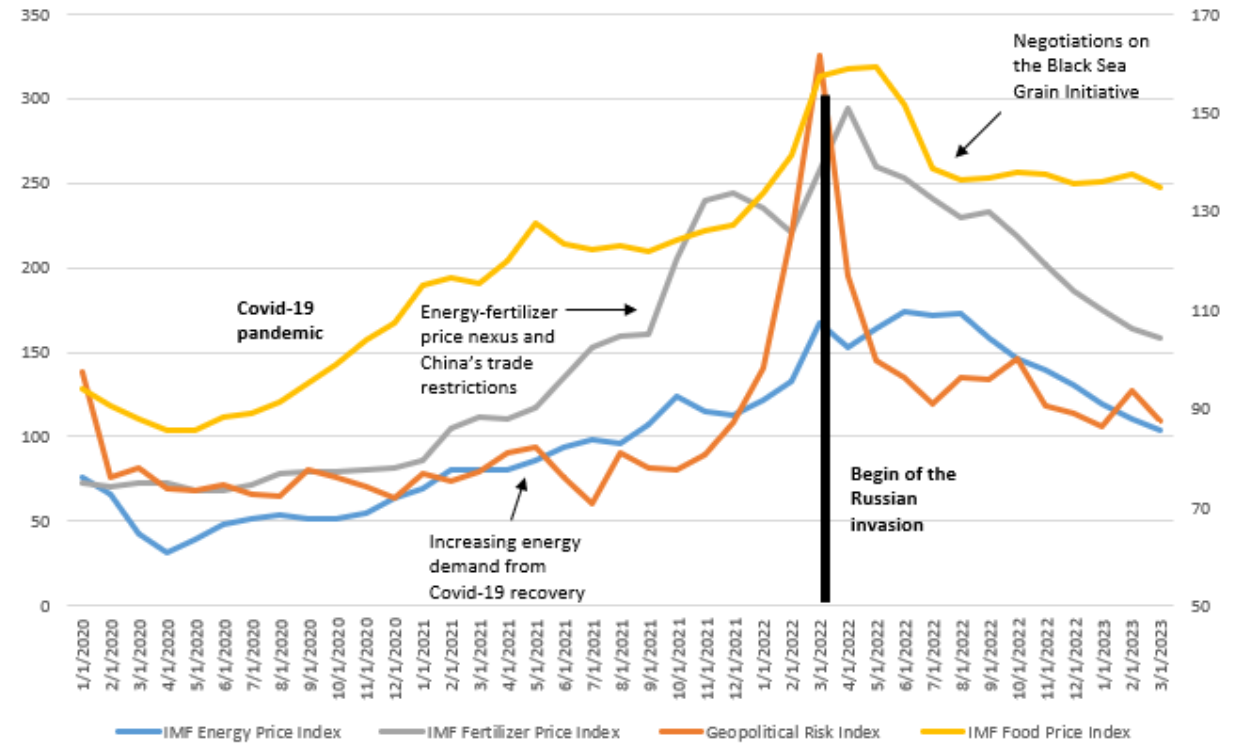

Political events and international market uncertainty are a key driver of food price dynamics, and part of the solution (Santeramo and Dominguez, 2021)

Food markets were already in trouble before Russian invasion of Ukraine (Kornher and von Braun 2022)

The Ukraine-war intensified the crisis

- 12% of calories traded globally (Russia and Ukraine)
- >50 of sunflower oil and cake trade
- 10% in global vegetable oil trade
- 16% in white fish trade (Russia)
- 16% in fertilizer trade (Russia)

International price development and major political events

Own illustration based on IMF (2023)

Marked differences in food price inflation across EU member states during post-2020 period

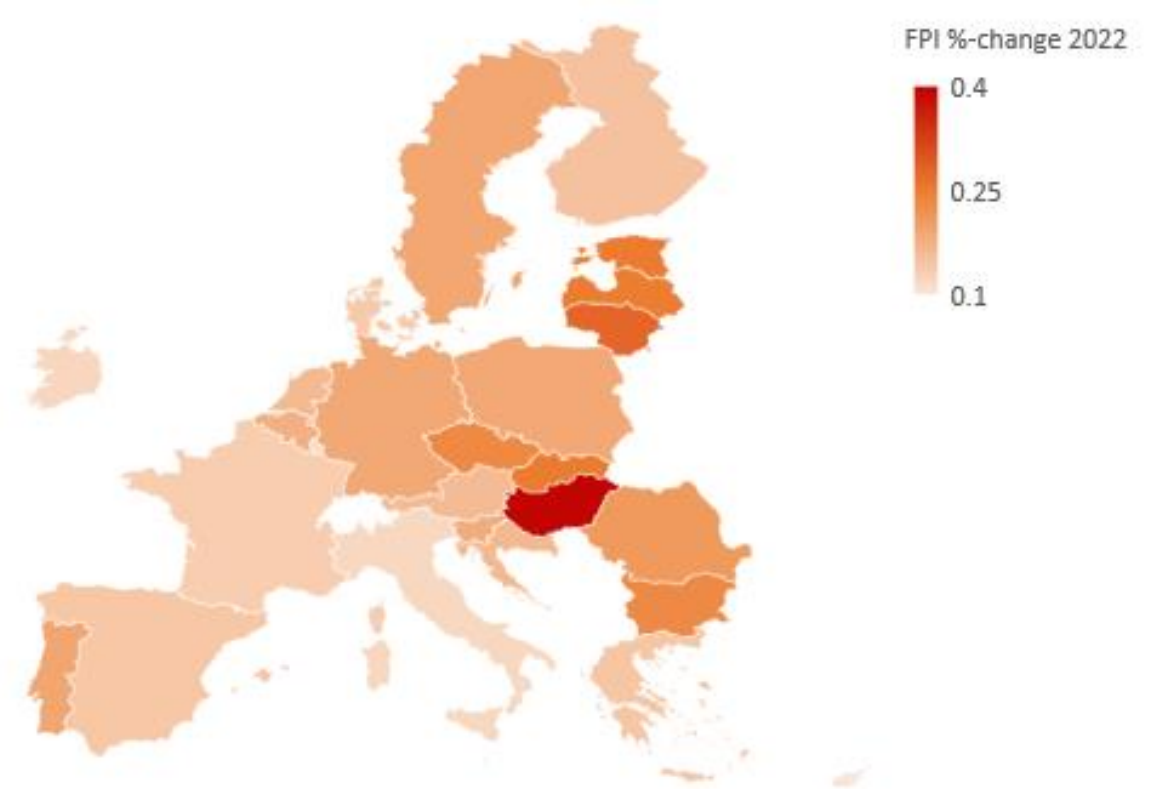

Food price inflation increased with stricter Covid-19 restrictions and case-counts (Akter 2020; Bai et al. 2022)

EU food prices are largely driven by international price movements but the impact varies over time (Peersman 2022)

Significant impact of the Ukraine-war on global food security (e.g. Abay et al. 2023)

Limited evidence on EU food price dynamics and interdependencies with structural factors

% change in FPI across EU countries (Jan2022-Jan2023)

Powered by Bing
© GeoNames, Microsoft, OpenStreetMap, TomTom

FPI is the nominal food price index

EU prices did not co-move with international prices in 2008 and 2011.

Internal supply and demand drivers remain very relevant for EU food price dynamics:

- Macro-economic dynamics (i.e. money supply)
- Input prices and production costs
- Weather variability

Exposure to international price movements is determined by level of trade integration

Food price dynamics between 2007-2023

Own illustration based on Eurostat (2023) and IMF (2023)

FPI is the nominal food price index; IPI is the nominal input price index; IMF Price Index is IMF's index for cereals

Note: EU price indices are unweighted averages across all member states.

Analytical framework (Law of One Price): $pW_{it} = pD_{ijt} + \tau_{ijt}$

$$p\hat{D}_{kit} = (1 - \lambda_{kit})pD_{kit} + \lambda_{kit}(pW_{kt} + \tau_{kit}) \quad \text{if } i \text{ is an importing country}$$

$$p\hat{D}_{kit} = (1 - \lambda_{kit})pD_{kit} + \lambda_{kit}pD_{kit}^T \quad \text{if } i \text{ is an exporting country}$$

where λ_{kit} is the international component, i.e. the consumption-weighted share of traded goods in group k. pW_{kt} is the international price for goods i in t with τ_{kit} the transaction cost of trading.

Hypo. 1: Relevance of the int'l/dom. component depends on the weight of the int'l component

Hypo. 2: The larger the int'l comp., the larger the price effects of global market turbulences

FPI:
Real food price
of products in
sector k and
country i

IPI:
Agricultural input
price index (IPI)
in country i

Openness:
Share of total trade in
sector k and country i
over the gross value
added of production of
country i's in each year

GDP:
quarterly GDP
of country i

$$\frac{fpi_{kit}}{cpi_{kit}} = \alpha + \delta fpi_{kit-1} + \beta_1 \frac{IPI_{it}}{cpi_{it}} + \beta_2 \frac{IPI_{it}}{cpi_{it}} \times Openness_{kit} + \beta_3 GDP_{it} + \beta_4 Openness_{ijt} + \beta_5 \frac{int\ price_{kt}}{GPI_t} + \beta_6 \tau_t + \beta_7 \frac{int\ price_{kt}}{GPI_t} \times Openness_{ijt} + \beta_8 \tau_t \times Openness_{ijt} + \gamma X' + \mu_{ij} + \varepsilon_{ijt}$$

Int price:
Sector-specific international
price index divided by the
global price index of all
commodities (GPI).

X:
control variables, such as the real
energy price index of country i,
the real international energy price
index, and the monthly average
stringency of Covid-19 policies

Relative importance of independent variables (net effect) from Shapely Decomposition

- ❑ Food price inflation driven by domestic factors (e.g. IPI)
- ❑ Trade openness mitigation effect on food price inflation
- ❑ More indirect (Geopolitical tension) *vis-a-vis* direct (Sanction share) effects
- ❑ Marked differences are observed across sectors
 - ❖ For F&Vs the international price has driven the most the price inflation
 - ❖ For animal products the effect of ag. prices were strongest
 - ❖ Trade openness has been an important driver for cereals, oilseeds, and sugar
