DIVISION OF COOPERATIVE EXTENSION
EXTENSION SERVICE - U. S. DEPARTMENT OF AGRICULTURE

1935 FARM FAMILY LIVING OUTLOOK CHARTS

Good extension teaching requires the judicious use of charts. Since economic facts often can be shown best through the use of charts, we have collected and are sending you herewith the important charts used in presenting the 1935 Farm Family Living Outlook Report.

Charts 1 to 4, furnished by the Bureau of Agricultural Economics, give facts as to farm income, prices farmers receive, prices farmers pay, and price changes for food, clothing, operating expenses, building materials, furniture and furnishings, and all commodities used for family maintenance.

Charts 5 to 7 show distribution of the average value of farm family living. Basic material upon which the charts are developed follows each chart. States that have household-account records doubtless will wish to substitute their own figures wherever possible.

Charts 8 to 12 deal with the farm family food supply, including the usual versus the desirable distribution of food groups at different money-value levels, and the money value of the food supply required for a farm family while a son and a daughter are being reared to the age of self-support, together with explanatory material.

Following is a list of the individual charts in this set:

1. 1935 Outlook for Farm Family Living and What To Do About It, Mimeo. 9237.
2. Distribution of Gross Income from Farm Production, 1924 to Date.
Neg. 26541-B.
3. Prices of Commodities Farmers Buy and Prices Received for Farm Products, Index Numbers 1910 to Date. Neg. 22288.
4. Prices Paid by Farmers for Food, Clothing, and Family Maintenance, 1910 to Date. Neg. 24214-B.
5. Prices Paid by Farmers for Operating Expenses, Furniture and Furnishings, Building Materials for House, and Family Maintenance, 1910 to Date.
Neg. 24213-B.
6. Value of Current Farm Family Living, S.C., Nebr., Minn., and Ill.,
Mimeo. 9279.
7. Recent Studies of Farm and Village Family Living. (Basic material.)
Mimeo. 9165.
8. Distribution of Average Value of Farm Family Living, Ill. and Ga.,
Mimeo. 9280.
9. Distribution of Average Value of Farm Family Living, Ill. and Ga.,
Mimeo. 9162. (Basic material.)

10. Average Cash Expenditures for Current Farm Family Living for 3 Years, Ill., Mimeo. 9278.
11. Average Cash Expenditures for Current Farm Family Living, Ill. (Basic material.) Mimeo. 9163.
12. Table I - Estimated Consumption of Principal Classes of Food in the United States Compared with Seven Food Plans: Quantities per Person per Year. (Mimeo. 588, Bureau of Home Economics.
13. Desirable Versus Usual Distribution of Food Groups in Yearly Farm Family Food Budgets, Mimeo. 9172-a.
14. Suggested Distribution of Food Groups in Yearly Farm Family Food Budgets, Mimeo. 9172-b.
15. It's a \$12,000 Enterprise To Feed a Farm Family While a Son and Daughter are Raised to the Age of Self-Support, Mimeo. 9185.
16. Plan Ahead for This \$12,000 Enterprise, Mimeo. 9179.
17. It's a \$12,000 Enterprise to Raise a Son and Daughter to the Age of Self-Support. (Basic material.) Mimeo. 9178.
18. The Contribution of the Foods and Nutrition Project to Farm Family Living Adjustments in 1935, Mimeo. 9302.

1935 OUTLOOK FOR FARM FAMILY LIVING

OUTLOOK	WHAT TO DO ABOUT IT
Income from sale of farm products and from sources other than agriculture somewhat better in 1935.	Safeguard cash income by producing the maximum amount of food and fuel for family use.
More cash released for family living in 1935 because of lowered interest rates and debt refinancing by governmental agencies.	Make a plan for the year's food supply. Secure family cooperation in food production and home sewing.
In drought areas low reserves of food supplies and small cash income until new crops are marketed.	Improve the house and grounds and repair furnishings. Take advantage of housing improvement plans of the Federal Housing Administration.
Food prices somewhat higher.	Pay cash and take cash discounts when available to avoid the costs of store credit.
Prices of other goods and services probably continuing at about 1934 levels.	Take advantage of high retail prices by selling products at roadside or farm women's markets.
Certain consumer goods labeled according to grades.	Save cash by cooperative buying and bartering.
Stimulation of housing improvements by the government.	Weigh relative values in deciding upon cash outlays. Keep farm and home accounts as guides.
No increase in length of farm women's working day due to family cooperation.	Buy according to grade labels where these are available. Take advantage of opportunities for consumer education. Take action thru consumer organizations where price increases appear out of line. Provide for necessary medical and dental attention. Continue education of young people beyond grade schools. Use and expand home and community recreation facilities. Keep informed on domestic and foreign economic situations.

Distribution of Gross Income from Farm Production, 1924 to Date

1/ Includes some milk from which only cream is used.

2/ Includes bacon and salt pork.

The quantities of different articles of food estimated as consumed were computed by the Bureau of Agricultural Economics and the Agricultural Adjustment Administration from statistics on production, export, import, allowances for seed, feed, and the wastes of distribution.

Food plans 1 and 2 are suggested for use when practically no food is supplied by the farm and there is very little cash for buying food. These are the "restricted" and "minimum-cost adequate" diets presented in Circular 296.

Plans A and B are suggested for use when there is a very large garden (and/or orchard); a cow, but little other livestock or poultry for food purposes.

Plan C is suggested for use when drought greatly reduces garden supplies, and forces the slaughter of more of the livestock than usual for food.

Plans 3 and 4 are suggested for use by families with considerable capital and a going food production program. These are the "moderate-cost adequate" and the "liberal" diets presented in Circular 296.

Explanatory Notes on Charts 9172-A and 9172-B

9172-A, DESIRABLE VS. USUAL DISTRIBUTION OF FOOD GROUPS
IN YEARLY FARM FAMILY BUDGETS

This chart shows the usual distribution of food groups in farm diets whose retail money value averages \$107 per person per year when adjusted to September 1934 prices, and compares with this a distribution of these food groups that would yield better returns in nutrition. At the same money-value level the suggested distribution puts more emphasis on vegetables, fruits, and milk and consequently less emphasis on the other items.

This chart is based in part on studies of farm family food consumption analyzed by the Bureau of Home Economics. In these studies the money value of food per person per year most frequently found approximated \$107. This amount is slightly above the money value of the minimum cost diet set up by the Bureau in U.S.D.A. Circular 296. See also Chart 588, Table I, Estimated Consumption of Principal Classes of Food in the United States Compared with Seven Food Plans, Food Plan No. 2.

(over)

9172-B, SUGGESTED DISTRIBUTION OF FOOD GROUPS
IN YEARLY FARM FAMILY FOOD BUDGETS
OF DIFFERENT MONEY VALUE

The \$107 level corresponds both to the usual level of money value per person per year of the farm family diets studied by the Bureau and also roughly to the money value of the minimum cost adequate diet (see Chart 588, Table I, Estimated Consumption of Principal Classes of Food in the United States Compared with Seven Food Plans, Food Plan No. 2), when both are adjusted to September 1934 retail prices. The \$160 level is that of the moderate-cost adequate diet suggested by the Bureau, similarly adjusted. The chart shows that as one passes from the minimum-cost adequate to the moderate-cost adequate diet there should be comparatively little difference in the money value of sugars, grain products, and fats, but that there should be a slight increase in the money value of milk and cheese and a considerable increase in the money value of meat and eggs, fruits and vegetables.

It will be noted that both the dollars and the percentage of total money value used for fruits and vegetables increase decidedly as we pass from the minimum-cost adequate diet to the moderate-cost adequate diet, whereas there is a decrease in the percentage of the total money value used for meat and eggs, although the actual number of dollars spent for these foods increases considerably.

This chart illustrates also how families who may be unable to provide an entire food supply on the moderate-cost adequate level because of special types of farming or unusual growing conditions, combined with low income, may nevertheless greatly improve the diet by making generous use of available fruits, vegetables, milk, eggs, or meat.

Interpretation and Basic Information for Above Titled Charts

The first chart shows the retail replacement value of a moderate-cost adequate diet for a farm family of four over a period of 22 years while a boy and girl are being reared to 18 years of age, the so-called age of self-support. The purpose of the chart is to emphasize the large money-value total involved in this enterprise viewed as a whole.

It is assumed that 2 years of married life elapse before the birth of the son. The daughter is born 2 years later. Both children continue as members of the farm family until their 18th birthdays when they are presumed to leave the farm to take up some job.

Thus the farm supports father and mother for 2 years before the children come and for 20 years while they are growing up. It also supports each child for a total of 18 years.

The value of the food supply is arrived at by computing the yearly amounts of the various food groups required for each member of the family, adding all these together and figuring the total cost of September 1934 retail prices as collected by the Bureau of Labor Statistics. The food allowances for man and woman at very active work and for children at various ages are based on the moderate-cost adequate diet as shown in table 6 on page 14 of U.S.D.A. Circular No. 296, Diets at Four Levels of Nutritive Content and Cost.

These amounts are approximately:

\$4,100	for man at active work for 22 years.
5,700	for woman at active work for 22 years.
2,200	for farm boy, from birth to 18th birthday.
2,000	for girl from birth to 18th birthday.
<u>\$12,000</u>	- Total for family.

Note that this food supply does not include provision for guests, hired men, or household help. It provides for only a small percentage of table waste, approximately 5 percent, making no allowance for such gross wastes as may occur in the trimming and storage of vegetables and fruit and the home cutting of meat. In fact, "the quantities provided are in terms of products delivered to the consumer's door." The food supply shown in the chart provides no surplus against possible lean years to come. Hence, many of the food groups in the production plan for the farm family may well be increased by from 15 to 50 percent.

(over)

The second chart presents an argument for planning from the beginning to provide this large food supply with the least outlay of cash, through a home production program.

The total money value of the 22-year food supply, computed at retail prices as of September 1934, amounts to \$11,890. For simplicity, we have adjusted all figures to a total money value of \$12,000, increasing the amounts of food and the money value proportionately to the original percentage representation of the various food groups. The table below shows the actual amounts of food and the actual money value on the basis of a total of \$11,890, and the adjusted amounts and values on the basis of \$12,000.

Division of Cooperative Extension

Farm-home adjustments recommended to meet 1935 conditions	What the foods and nutrition program can do
Safeguard cash income by producing the maximum amount of food and fuel for family use.	Give help in food production and food conservation as needed. Also promote appropriate home food manufactures. Help women to develop judgment as to conditions under which home food manufacture is desirable.
Make a plan for the year's food supply. Secure family cooperation in food production.	Encourage the purchase of individual pressure-canning equipment as a permanent investment. Help to obtain favorable prices on containers. Promote the general use of an annual food-supply plan based on the nutritional requirements of the family and type of farming. Include a canning and storage budget. Allow an adequate margin for seasonal variations, losses in storage, emergencies, company, unexpected additions to the family, gifts, charity, sale, and barter.
Save cash by cooperative buying and bartering. Pay cash and take cash discounts when available to avoid the costs of store credit.	Emphasize the security and family cooperation values of such a food-supply plan. Secure demonstrators to make farm food-supply plans and keep accounts of food produced, used, and sold from the farm, and of food purchased. Give publicity to results obtained.
Take advantage of high retail prices by selling products at roadside or farm women's markets.	Help women to investigate possibilities of cooperative buying of food. Encourage and assist farm women to barter quality food products for services and materials needed for health upkeep and for more abundant living.
Buy according to grade labels where these are available.	Help farm women to produce quality canned, preserved, and baked goods for sale at curb markets, at roadside stands, and to private customers. Teach food buying, food grades and standards where such purchasing information is needed. Especially important because some rise is expected in food prices.

Weigh relative values in deciding upon cash outlays. Keep farm and home accounts as guides.

Continued education of young people beyond grade schools.

Provide for necessary medical and dental attention.

Use and expand home and community recreation facilities.

Take advantage of opportunities for consumer education. Take action through consumer organizations where price increases appear out of line.

Keep informed on the domestic and foreign economic situations.

Encourage women to keep simple food accounts; if possible, as a part of farm-home accounts.

Show how a comprehensive food-supply plan, skillful buying, and positive health for all the family will help to save cash needed for education, preventive medical care, clothing, house furnishings, and other materials and services.

Teach signs of optimal growth and nutrition; urge weighing, physical examinations, correction of defects where indicated.

Promote the use of the "ACH Index of Nutritional Status", as developed by the American Child Health Association.

Where leadership is needed, cooperate in the school lunch.

Urge that daily meals be made to contribute to the health and happiness of the family through wise planning, skillful preparation, and interesting table talk. Encourage family parties and simple, gracious hospitality.

Show the possibilities of well-planned and attractively served community meals at get-togethers for recreation and discussion.

Watch prices. Judge and assist county and community consumers' councils.

In Drought Areas

Help to work out emergency diet and food-supply plans for winter and spring, which will supply at least the minimum dietary essentials. Enrich the diet wherever possible by home-produced or locally cheap foods. Give practical help in meal planning for children and expectant mothers, food buying, food preparation.

In General

Emphasize time and money management and family-relationship aspects of food production, preparation, and serving.

Reach homes with children.

Interest older club girls with challenging foods and meal-management projects.

Present appropriate nutrition information to men and boys.

Cooperate in the rural rehabilitation program.
