Economic Indicators of the Farm Sector

National Financial Summary, 1989

It's Easy To Subscribe!

Just dial 1-800-999-6779. Toll free.

Ask for Economic Indicators of the Farm Sector series.

The series is available by subscription. Five separate reports are published each year:

National Financial Summary
State Financial Summary
Costs of Production—Livestock and Dairy
Costs of Production—Major Field Crops
Production and Efficiency Statistics

Subscription rates are \$14 per year. Multiyear subscriptions are available at \$27 (2 years) and \$39 (3 years). Single copies are \$8.00 each. For non-U.S. addresses, add 25 percent (includes Canada). Charge your purchase to your VISA or MasterCard, or we can bill you. Or send a check or purchase order (made payable to ERS-NASS) to:

ERS-NASS P.O. Box 1608 Rockville, MD 20850

Can You Use an Electronic Database?

An electronic database containing data in this report is also available. This database is in the form of Lotus 1-2-3 worksheet files on DOS-compatible, DSDD diskettes.

To order, just dial 1-800-999-6779.

Ask for *National Financial Summary* database (order #88010A, three 5.25" disks, \$45, or order #88010B, one 3.5" disk, \$25). For non-U.S. addresses, add 25 percent (includes Canada). Economic Indicators of the Farm Sector: National Financial Summary, 1989. Agriculture and Rural Economy Division, Economic Research Service, U.S. Department of Agriculture. ECIFS 9-2.

Abstract

Net farm income rose 11.7 percent in 1989 to \$46.7 billion, while net cash income fell 6.0 percent to \$54.6 billion. Both income concepts reflect cash income minus expenses. But, unlike net cash income, net farm income takes into account noncash items, such as the value of change in inventories. Farmers rebuilt inventories by \$4.4 billion after drawing down inventories by a comparable amount in 1988, when they sold crop inventories at high market prices (triggered by severe drought in some States) in order to raise net cash income. Production expenses rose in nearly every category as farmers increased planted acres. The equity in farm assets rose in 1989 as the value of farm assets increased and debt fell.

Keywords: Net farm income, returns to operators, cash income from farming, production expenses, cash receipts, Government payments, farm assets, and farm debt.

Highlights

Net farm income rose 11.7 percent in 1989 to \$46.7 billion, while net cash income fell 6.0 percent to \$54.6 billion. Both income concepts reflect cash income minus expenses. But, unlike net cash income, net farm income takes into account additional noncash items, such as the value of change in inventories. Farmers rebuilt inventories by \$4.4 billion after drawing down inventories by a comparable amount in 1988, when they sold crop inventories at high market prices (triggered by severe drought in some States) in order to raise net cash income. Production expenses rose in nearly every category as farmers increased planted acres. The equity in farm assets rose in 1989 as the value of farm assets increased and debt fell.

Net cash income fell almost \$4 billion in 1989, reflecting the absence of a comparable amount of sales of commodities from inventories in 1988, a year of substantially lower production due to the drought. However, farmers maintained net cash income near the record high levels achieved in 1987 and 1988 of \$56 billion and \$58 billion, respectively. Gross cash income rose 4 percent but was more than offset by the 9-percent jump in cash expenses. Cash expenses increased across the board, led by double-digit percentage increases in property taxes, rent to landlords, and intermediate product expenses. The latter category includes such major expense categories as feed, fertilizer, fuels, pesticides, and seed.

U.S. agriculture in 1989 was in its fourth year of recovery from the farm recession experienced earlier in the decade. Farmers restructured their operations to control costs, and commodity prices rose. Both forces helped alleviate the price-cost squeeze on farm income earlier in the decade. The upward trend in expenses over the past couple of years reflects rising optimism among producers, who are stepping up production to take advantage of the more favorable earnings opportunities available.

The \$5-billion increase in net farm income was the result of a combination of three factors: (1) efforts by farmers to increase production, (2) improved crop yields due to a return to more typical weather patterns, and (3) higher prices received for most commodity groups. Farmers used a portion of the increased crop production to replenish inventories sold in prior years to take advantage of higher prices and maintain cash income.

Total farm production expenses rose 8 percent, led by substantial boosts in all major categories of purchased inputs including pesticides (up 29 percent), seed (14 percent), fertilizer (12 percent), and feed (10 percent). Prices paid for inputs were generally up, but farmers purchased larger quantities to increase production in response to higher commodity prices that existed early in the year when they were in the planning phases of their operations.

Total farm assets (excluding operator households) rose 4 percent to \$794 billion. Farm real estate values climbed 4 percent, continuing the increase started in 1987. The net worth of farm-asset owners rose for the third year in a row to \$658 billion. Farm debt (excluding operator households) declined to \$136 billion.

Preface

This report is one of five in the Economic Indicators of the Farm Sector series. Other segments are: State Financial Summary, Production and Efficiency Statistics, Costs of Production--Major Field Crops, and Costs of Production--Livestock and Dairy.

This publication was prepared by the Farm Income Estimation Section and the Farm Financial Analysis Section, Farm Sector Financial Analysis Branch, Agriculture and Rural Economy Division, Economic Research Service.

Economic Indicators of the Farm Sector National Financial Summary, 1989

Introduction

Most farm income and balance sheet statistics in this publication are for 1945-89, and are derived from five measures of farm income and two of the farm sector balance sheets. Dependence on any one measure would give a misleading picture of the financial farming conditions. Because there are differing concepts and definitions of income and equity, readers are urged to choose carefully the most appropriate measures of farm income for their purposes. For help in choosing the appropriate income measure, refer to illustration 1 and the following text. Capital gains and return on equity are also included in the publication. The cash income from farming and the balance sheet accounts are presented by the value of gross sales classes to allow readers to evaluate the economic conditions for different size farms. The reader may wish to read the handbooks on farm income and the balance sheet for more information on these accounts.1

USDA defines a farm as any establishment that sells or normally would sell \$1,000 of agricultural products in a calendar year. The principal operator of a farm is defined as the individual making the largest number of the day-to-day management decisions of planting, purchasing, harvesting, and marketing. When partners share equally in the decisionmaking, the oldest partner is considered the principal operator. The operator category includes owner-operators, partners, tenants, paid and unpaid managers associated with corporate or institutional farms, and contractors that raise crops or livestock for a fee.

The net income accounts, net farm income, net cash income, net business income, and the farm production transactions account, do not represent income to the operator. Rather, the net income represents the income earned by the farm operation and accrues to a group of

individuals who share in the risks associated with production. These individuals are the owner-operators, partners, tenant-operators, shareholders in farming corporations, and contractors. Hired managers, although operators of farms, do not share in the net income proceeds because their salaries are treated as an expense in the hired labor account.

Concepts and Data Sources of Income Accounts

The organization and presentation of income and expenses of the farming sector is determined by the concept being measured. This publication presents statistical series for five major income concepts (see illustration 1): (1) net farm income, (2) net cash income, (3) net cash-flow, (4) net business income, and (5) farm production transactions. All of these income series are based on calendar years rather than crop years.

Net Farm Income

The oldest and most widely recognized series, net farm income, is an approximate measure of the net value of production during a calendar year. Net farm income includes all income and expenses, both cash and noncash, associated with the farm business and dwellings located on farms. Net farm income measures the economic profit from current-year production of commodities, whether or not sold from the producing establishment, and the net income generated by onfarm dwellings.

Gross farm income includes cash receipts from the sales of commodities, all other farm cash income (direct Government payments and other farm-related income earned from farm assets), noncash income (the value of home consumption and an imputed rental value for operator, hired laborer, and other farm dwellings), and the value of the change in inventory during the calendar year. Cash receipts from sales of agricultural commodities are the major component of gross income. In calculating cash receipts, we treat placements of commodities under Commodity Credit Corporation (CCC) loans as sales at the time the commodity is placed under loan because the producer can decide not to reclaim the commodity and keep the loan proceeds. If the producer decides to repurchase the commodity for

later resale, the payment to CCC is deducted from the commodity's value in an open market sale, and the difference is included in cash receipts in the year of redemption.

We adjust gross income to reflect changes in inventories to account for production that occurred during the year but remained unsold and unused at the end of the year. The inventory adjustment also offsets sales from inventories carried over from the previous year. Conceptually, the inventory adjustment represents the difference between additions to inventories from currentvear production that remain unsold and unused as of December 31 and sales from production in the prior year that reduce inventories between January 1 and harvest. Depending on which is larger, the net effect can be positive or negative. Positive changes infer net additions to beginning-year inventory, and negative changes infer net drawdowns of beginning-year inventory. In most years, the inventory account principally reflects the yearto-year differences between the frequently volatile supply of crops and the more stable demand for crops. Livestock inventories are generally comparatively stable within multiyear cyclical trends.

We calculate the value of the change in inventory by determining the quantity change between January 1 and December 31 and valuing it at the calendar-year weighted market price. Due to a lack of reliable information regarding farmer-owned stocks stored both on farms and off, the quantity change in inventory, particularly for crops, is computed as total production less quantities sold and used on the farm where produced. We deduct the value of commodities such as feed and seed used or consumed on the farm where produced to avoid double-counting. The value of commodities used on the farm where produced is eventually reflected in gross income in home consumption or cash receipts.

The value of the change in inventory quantities differs from the change in the value of inventory. The change in the value of inventory equals the difference between the value of inventory at the beginning and at the end of the year, and is affected by changes in both quantities and prices. The concept used in the U.S. Department of Agriculture (USDA) income accounts eliminates the effects of changes in the value of inventory produced in previous years and the need for a price appropriate to an assumed disposition of the inventory at a point in time.

In addition to cash expenses, we include estimates of the value of in-kind perquisites to hired labor and capital consumption (depreciation and accidental damage). The depreciation provisions measure the replacement costs of assets used during a year, based on normal rates of wear and obsolescence.

USDA's net farm income measure is the basis for the U.S. Department of Commerce's (USDC) measures of net farm income to proprietors and corporations, which is a component of the National Income and Product Account (NIPA). USDC computes its own capital consumption figures based on different procedures and service lives rather than using USDA's figures. Both capital consumption estimates reflect the replacement value of capital items. USDC also subtracts Federal fines and salaries of corporate officers and adds monetary interest received by farm corporations to the USDA net farm income estimate.

Farm Production Transactions

The farm production transactions account measures the distribution of income from agricultural production to the factors of production: capital, labor, and management. Owners of the factors of production receive returns earned by the factors. Factor payments are divided between farm operators and nonoperators. Factor payments to nonoperators are expenditures made by farm operators for their use of the nonfarmers' capital, labor, and management. Returns to operators is the residual income generated by farm businesses after all nonfactor payments and payments to other factors of production are made.

The returns to operators, within the farm production transactions account, is similar to net farm income, with only one difference. The net farm income measures the net income generated from the farm business and the operator's onfarm dwelling, while the returns to operators category measures the net income generated by the farm business. The difference between the net farm income and the return to operator figures is the amount of net income attributed to the farm operator's dwelling. Both the gross income and expenses for these accounts differ only by the income or expense for the farm operator and other farm dwellings, although the expenses for the farm production transaction accounts are listed in a different sequence to show the returns to nonoperators. See illustration 2.

Net Cash Income and Net Cash-Flow

Net cash income and net cash-flow from farming exclude all noncash income, inventory adjustments, noncash expenses (capital consumption and perquisites to hired labor), and the income and expenses associated with operators' dwellings. Net cash income measures cash earnings that farmers receive in a calendar year from their farm businesses. Farmers use their net cash income from farming to purchase farm capital items, reduce farm debt, and meet family obligations. Farm operators have some choice over their level of net cash income from farming since they can choose whether to

sell or store commodities and can defer or incur some farm expenses.

NA = not applicable.

The net cash-flow account expands on the net cash income concept to account for internal and external sources and uses of funds by adding changes in the level of farm debt and farm operators' other financial assets to gross cash income and adding capital purchases to cash expenses. Because ERS analysts do not have measures of farm debt and capital purchases of farm operators, the net rent to nonoperator landlords is added to represent net cash income for both nonoperator landlords and farm operators. The resulting net cash-flow is unique among the farm income accounts because it measures

net income to nonfarm landlords and farm operators from farm businesses rather than net income to farm operators. Net cash-flow is an indicator of the financial position of farm businesses and their ability to meet current obligations.

Net Business Income

The net business income account provides a measure of income that is conceptually similar to the net income from farming reported to the Internal Revenue Service (IRS). IRS allows farmers to treat capital consumption (depreciation and accidental damage) as an expense item. The ERS net business income account is likewise computed by subtracting the sum of cash expenses and capital consumption from gross cash income or, alternatively, net cash income less capital consumption. It should be noted that taxable farm income reported on Schedule F to the IRS does not agree with USDA's measure of the farm sector's net business income because of several conceptual differences. One major difference is the treatment of depreciation. IRS allows farmers many choices regarding the parameters of the depreciation schedules, and farmers employ many variations for tax purposes. In contrast, the ERS depreciation account represents economic depreciation, which is defined as the decline in the present value of future earning capacity during the calendar year. Because economic depreciation is measured at replacement cost rather than original purchase price, the ERS depreciation estimates also indicate the amount that must be spent on capital items so that the end-of-year stock is capable of providing the same services as the beginning-of-year stock.

Off-Farm Income

Off-farm income is measured only for principal farm operators and their family members and includes only cash income. Off-farm income is the sum of cash income from nonfarm wages and salaries, nonfarm businesses and professional income, interest and dividends, retirement and disability income, royalties, wages and salaries earned on other farms, and other cash income.

Sales Class Distributions

Financial conditions vary greatly by the size of the farm. A customary way to measure farm size is according to the value of agricultural sales. This publication contains net cash income and its components by seven sales class categories (see table 29). Considerable care must be exercised in interpreting the averages computed on a per-farm or per-operation basis by sales class. Per-farm sales class statistics should not be interpreted as being per-farmer statistics, which would be lower if the number

of operators in each class could be determined and used as the divisor. Farms may have more than one operator and a farm operator may be involved in more than one farm. In the larger sales classes, a higher proportion of agricultural operations involves multiple operators who share in the risk of production activities. These operators conduct business under various legal arrangements, including corporations, partnerships, multifamily farms, and other multiple-interest operations. Under some operating arrangements, the definition of the "operator" may be difficult to ascertain and be of questionable benefit. For example, a feedlot operator may provide custom feeding services to a livestock investor. The investor/owner of the animal bears the production risks, while the (more traditionally defined) onsite operator controls the production facilities and provides a service under contract for a predetermined, risk-free fee.

Other Data Assessments

Data for the five income accounts are based on many sources that change over time based on improvements of methodologies and more available data. Some general comments can be made regarding sources of the current data base. Cash receipt data, by commodity, State, and month, are based on production data from USDA's National Agricultural Statistics Service (NASS). Inventory adjustment is also based on NASS data. Data on direct Government payments and CCC loans made and repaid come from USDA's Agricultural Stabilization and Conservation Service (ASCS). The Census of Agriculture (U.S. Department of Commerce) and USDA's Farm Costs and Returns Survey (FCRS) provide data used to compute the other gross income and production expense figures. Data from private industry and Government agencies are also used to estimate production expenses. The distributions of income and expense items, by value of agricultural sales classes, are based on the Farm Costs and Returns Survey, the Census of Agriculture, and the 1979 Farm Finance Survey.

The Census of Agriculture is a reliable source of data but is available only every 5 years. Therefore, a benchmark-mover system is employed in accounts dependent on Census of Agriculture data. Under this system, we incorporate census data as they become available and move the census data according to the most appropriate annual data between census benchmarks. FCRS data are often the most appropriate and, usually, the only data available on an annual basis. We use the farm definition adopted by the Census of Agriculture in 1974, which includes places with actual or potential sales of agricultural products of \$1,000 or more. USDA began using this definition in the 1975 income series. The principal farm operator is defined as the

individual most directly responsible for the day-to-day management decisions of purchasing and marketing. When partners share equally in the decisionmaking, the oldest partner is considered the principal operator. The operator category includes owners and tenants as well as managers associated with corporate or institutional farms.

Overview of the 1989 Agricultural Sector

Net farm income rose 11.7 percent in 1989 and net cash income fell 6.0 percent as farmers increased production and replenished their inventories of crops. Crop receipts increased 5.7 percent and livestock receipts rose 6.2 percent. The value of inventory adjustment went from a \$4.1-billion sell-off in 1988 to a \$4.4-billion replenishment in 1989. Direct Government payments declined 25 percent and production expenses rose 8 percent. Production was up in 1989 for two reasons. First, crop yields were higher than those of the drought-reduced levels of 1988. Second, farmers put more resources into production to reap the benefits of higher prices. Farmers used a substantial portion of the production in 1989 to replenish crop inventories that were sold in 1988, when prices rose after the effects of the drought were realized. The placement of production in inventories was the major contributor to the divergence in net farm income and net cash income.

The farm sector balance sheet continued to improve in 1989, as farm equity increased for the third year in a row. The value of farm assets (excluding operator household) rose for the third consecutive year with a jump of \$30 billion, and outstanding debt (excluding operator household) declined \$2 billion. A further decrease in financial stress among many farmers with debt was mirrored in improved income-to-wealth ratios and other wealth measurements that reflect financial conditions in the sector (see table 11).

Income Accounts

Following are the highlights of the trends in the six major accounts.

Net Farm Income

Net farm income in 1989 was \$46.7 billion, up from \$41.8 billion in 1988. Gross farm income rose 8.8 percent (\$15.4 billion), and production expenses rose 8.0 percent (\$10.5 billion). Cash receipts from farm marketings rose \$9 billion, with a \$4.1-billion increase in crop receipts and a \$4.9-billion increase in livestock receipts. Crop producers increased production substantially from 1988, a drought year, used a portion (\$4.4 billion) to replenish inventories, and received \$3.6 billion less in direct

payments from the Government. Crops were marketed at prices that were stable or a little higher in 1989 as farmers continued to reap the benefits of the increase in crop prices that began in May 1988, when it became evident that the drought would be severe. The quantities and prices for livestock and livestock products were mostly unchanged from the previous year.

Farm Production Transactions

The returns-to-operators category, which differs from net farm income in the exclusion of all income and expenses related to operator dwellings, rose 11 percent to \$44.5 billion in 1989. Gross receipts of farms, which differ from gross farm income only by the exclusion of the imputed rental value of operators' dwellings, rose 9.3 percent (\$15.5 billion) to \$182.9 billion. Nonfactor payments increased 9.5 percent (\$9.0 billion), while factor payments increased 8.9 percent (\$6.5 billion).

Higher nonfactor payments resulted from increases in intermediate product expenses, particularly purchased feed, fertilizer, pesticides, and seed. Among factor payments, returns to operators and net rent to nonoperator landlords were both up at least 10 percent, while payments for interest and hired labor were relatively stable. The dominant force was the increase in returns received by operators (\$4.4 billion) for their factors of production (management, labor, and equity capital). The 16.6-percent higher payments in net rent received by nonoperator landlords was a reflection of the improving situation in farmland values.

Net Cash Income and Net Cash-Flow

Net cash income in 1989 was down 6.0 percent from the previous year. Gross cash income was up 4.1 percent but failed to offset a 9.4-percent rise in cash expenses. Expenditures rose as farmers, with the benefit of improved weather conditions, increased crop production. In particular, production of corn and soybeans was up 53 and 24 percent, respectively. Net cash income fell in 1989, however, because farmers chose to use \$4 billion of the year's production to rebuild inventories, which were depleted by a comparable amount in 1988.

Net cash income represents earnings that are available for principal repayment, capital purchases, and family living expenses. When droughts do not occur in 2 consecutive years, farmers are able to adjust inventories to stabilize their cash income despite the variability in production reflected in net farm income. The farm sector's liquidity and debt-servicing ability has improved since the mid-1980's because of increased net cash income from farming and lower levels of farm debt.

Net cash-flow declined 4 percent in 1989 following increases in excess of 20 percent in each of the 3 preceding years. In 1988, net cash-flow far surpassed its previous record set in 1979. Net cash-flow is the sum of net cash income, changes in loans outstanding, changes in holdings of other financial assets, and the net rent to nonoperator landlords, minus capital expenditures. A large reduction in the value of loans outstanding was the significant factor in the sharp decline of net cash-flow in 1985. The value of loans outstanding continued to decline through 1988 but at a slower rate, which contributed to a rise in net cash-flow. Total loans outstanding (excluding households and CCC) increased from 1954 to 1983. From 1984 to 1987, total loans sharply declined, then stabilized in 1988 and 1989.

The upward trend in net cash-flow since 1985 was due to a combination of rising net cash income and the fact that the value of loans outstanding was declining in smaller increments each year. Increases in loans outstanding add to cash-flow and vice versa, but the relative sizes of the changes also affect cash-flow. If recent declines in loans outstanding should slow, the amount of offset to the positive components of net cash income would be less each year, increasing the cash-flow from the previous year. In making year-to-year comparisons, the effects on cash-flow of declines in loans outstanding can be substantial.

Capital expenditures increased to \$13.0 billion, 17.3 percent above 1988, as farmers continued to show a cautious interest in purchasing equipment and facilities. The \$7-billion drop in spending on capital items since 1979 partially offset the large change in loans outstanding. The sector's cash-flow account tends to mirror the trend in farmland values. Land has been used as collateral for farm loans and when land appreciated in value before the 1980's, loans outstanding grew, often at a rapid rate. As farmland values declined in the early 1980's, although recently reversed, the farm loans outstanding fell.

Net Business Income

Net business income is a measure of farmers' earnings based on accounting methods that correspond to those used for tax purposes. Under the IRS's cash accounting method that is used by most farmers, income equals payments received less the sum of payments made and capital consumption. Net business income has recently tracked net cash income closely but at a lower level, reflecting the additional noncash deduction for capital consumption, which changed little until recently. In 1985, 1986, and 1987, net business income increased relative to net cash income as capital consumption decreased. In

1989, capital consumption rose slightly from the prior year, and net business income fell 9.3 percent compared with the 6.0-percent drop in net cash income.

Off-Farm Income of Principal Farm Operators

Off-farm cash income of principal farm operators and their household members in 1989 was \$57.5 billion, virtually unchanged from 1988. This income buffers to some extent the financial risks of farming by contributing to the improved liquidity and debt-service capability of the farm sector.

Balance Sheet Accounts

The balance sheet accounts can be used to assess wealth in the farm sector. They include assets, debt, and equity, where equity equals assets minus debt. Assets are valued at current market prices on December 31 of each year, or as close to December 31 as possible. We also estimate nominal and real capital gains on farm assets and debt, as well as the total rates of return on both assets and equity. Total rates of return include the rates of return on current income plus the rate of return on real capital gains. These financial measures provide useful indicators of farm sector profitability.

The balance sheet accounts contain one set of statistics that includes farm operator households' assets and debt and another set that excludes them. Both sets include operators' and landlords' shares of the assets and debt for the farming operation. The balance sheet account excluding operator households subtracts the value of the operator dwelling, the household portion of automobiles and trucks, household equipment, financial assets, and related debt on these assets from the balance sheet account including operator households. Debt is classified as either real estate or nonreal estate depending upon how the loan is secured. If the loan is secured by farm

real estate, then it is classified as real estate farm debt, regardless of how loan proceeds are used.

Assets, Debt, and Equity

Farm assets (excluding operator households) as of December 31, 1989, rose 4 percent from a year earlier to \$794 billion. Real estate assets rose 4 percent, and nonreal estate assets also rose 4 percent primarily due to increases in the values of livestock and poultry, with all nonreal estate categories increasing except purchased inputs. Total farm debt declined from \$138 billion to \$136 billion. Real estate debt fell to \$74 billion in 1989 from \$76 billion. Farm real estate debt fell for all categories of lenders except all operating banks and life insurance companies. Nonreal estate debt remained unchanged at \$62 billion. Reflecting the increase in farm asset values and the small decline in debt, equity in farm assets (excluding operator households) rose 5 percent to \$658 billion.

Debt-to-Asset Ratio

The debt-to-asset ratio provides insight into the collateral security of loans, the relative indebtedness of the farm business, and the amount of risk borne by lenders. The U.S. farm sector's debt-to-asset ratio (excluding operator households) declined during 1989 from 18.0 to 17.1.

Rates of Return

The total real rate of return on assets (excluding operator households) was 4.7 percent in 1989. The rate of return on assets from current income was 4.9 percent, and the rate of return from real capital gains was -0.1 percent. The total real rate of return on equity in 1989 was 4.4 percent. The rate of return on equity from current income was 3.7 percent, and the rate of return from real capital gains was 0.8 percent.

Improvements and Changes to the Accounts

Farm program changes in the mid-1980's have encouraged farmers to place and redeem CCC quantities within the same month. Restructured CCC loan rates, Payment-in-Kind (PIK) program benefits, and transferable certificates provide incentives for farmers to reduce their CCC commodity stocks. Farmers redeem their CCC commodities if they can achieve a financial gain in doing so. Farmers initiate redemptions when the market price is above the CCC loan rate, or they are offered additional benefits to redeem under other Government programs. In the latter situation, some of the benefits are reflected in Government payments. In either case, a separate accounting of CCC placements and redemptions ensures better quality cash receipts and inventory adjustment figures in the farm income accounts. ERS has begun this separate accounting effective with the year 1986.

This accounting change for CCC loans has resulted in substantial revisions to cash receipts. Because the calculation procedure for cash receipts and inventory adjustment are linked, substantial revisions were also made in the value of inventory adjustment. The revisions in cash receipts were nearly offset by revisions in inventory adjustment. Therefore, the CCC accounting change has had little effect on gross farm income and net farm income. In gross cash income and net cash income from farming, the procedural change has a significant impact since these measures do not reflect inventory adjustments, a noncash item, and thus contain no offset to changes in cash receipts.

Changes in Income and Expenses for Farm Dwellings

After 2 years of reviewing the conceptual basis and computational procedures for the gross imputed rental value of farm dwellings and the related dwelling expenses, analysts replaced the traditional procedure that was based on a user-cost concept with a procedure based on market-observed rents for housing for 1984-89. Now, the gross rent for farm dwellings is computed by

multiplying the ratio of gross rent to market value of dwellings for urban dwellings by the market value of farm dwellings.

This procedural change was necessary because the user-cost method, although conceptually correct, is difficult to implement empirically because the rate of return on equity must be specified. Before, analysts used the average farm mortgage interest rate on farm real estate as a proxy for the rate of return on equity. High inflation rates during the 1970's and high interest rates during the 1970's and early 1980's led to estimates derived from the user-cost procedure that were increasingly unjustifiable. By the late 1980's, the gross imputed rent for farm dwellings divided by the market value of farm dwellings reached more than 20 percent. In contrast, market-observed data on gross rents and values for urban housing yielded a gross rent-to-value ratio in the range of 7 percent. The misalignment of the gross imputed income from farm dwellings can be attributed primarily to an excessively high rate of depreciation and the use of a nominal rate of return to equity without an offsetting adjustment for capital gains. The misalignment during the mid-to-late 1980's would have been even greater, however, if the value of farm operator dwellings had not been substantially understated in the balance sheet.

Analysts significantly changed computational procedures for farm dwelling expenses starting with 1984. Depreciation rates for dwellings were lowered, and the computational procedure for depreciation was simplified. All other farm dwelling expenses (interest, property taxes, insurance, and repairs and maintenance) are now computed from the FCRS data beginning in 1984 when FCRS first started asking farmers to report the value of farm dwellings located on farms. Before 1984, ERS analysts estimated dwelling expenses by using ratios of dwelling value to either total farm real estate value or to building value and applying these ratios to total farm expenses. Data users wishing to do time series analysis by using the imputed rent series may wish to give consideration to the inconsistencies in the statistics before and after 1984. ERS analysts will review during 1991 the possibility for extending the new computational procedures on farm dwelling gross rent and expenses for years before 1984.

New Data Sources and Adjustments

This publication contains many revisions in the farm income and expenses components for 1983-88. Most of the revisions resulted from the incorporation of the recently released 1987 Census of Agriculture data and the adjustment for the undercount of farms in the annual FCRS. When census data are released, ERS analysts review all farm income items that use census data in their computational processes. Because the Census of Agriculture is conducted only once every 4 or 5 years, ERS analysts use census data as benchmarks and use data from other sources to move these benchmarks between census years. The last census benchmark is held constant until the arrival of new census data. When the 1987 census data became available, ERS analysts added new benchmarks for 1987 and interpolated between the 1982 and 1987 census benchmarks. Accounts depending on census data were revised from 1983-88.

On the income side, ERS analysts indirectly incorporate census data into marketings of farm commodities under cash receipts. The National Agricultural Statistics Service (NASS) revises many of its production figures using the 1987 census figures. ERS analysts use the NASS revised figures in the computational process for cash receipts. Revisions to cash receipts are usually minor because NASS price and production statistics are survey based. ERS analysts also incorporate the 1987 census data into the farm-related income accounts.

The incorporation of 1987 Census of Agriculture data produced substantial revisions in the 1983-88 estimates for production expenses benchmarked to previous censuses: feed, seed, fertilizer and lime, pesticides, fuel and oil, electricity, and machine hire and customwork. The 1987 census also collected data on repair and maintenance expenses, property taxes, and cash rent to landlords (part of net rent to nonoperator landlords) for the first time. Benchmarking these

expenses to the census caused revisions in their estimates for 1987-88.

The estimates for expenses previously benchmarked to the 1982 census had been calculated: 1982 census divided by 1982 FCRS times the current-year FCRS. When results of the 1987 Census of Agriculture were incorporated:

- the data became ERS 1987 expense figures;
- the 1988-89 ERS estimates were based on the 1987 census-to-1987 FCRS ratio;
- the census-to-FCRS ratios were interpolated between 1982 and 1987; and
- the interpolated ratios were used to compute ERS estimates for 1983-86.

ERS analysts expanded the 1982-89 FCRS data to represent expenses for all farms. This adjustment in FCRS data takes into account the difference in number of farms in the FCRS and the NASS June Enumerative Survey. Most of the underrepresentation in the FCRS is in the small-size farms. The increase from adjusting the FCRS estimates lowered the 1982 and 1987 census-to-FCRS ratios. As a result, ERS's figures that depend upon the census were revised upward or downward depending on whether the FCRS data for that year increased more or less than the FCRS results for 1982.

Off-Farm Income

The off-farm income figures for 1985-88 were revised upward because of the adjustment to the annual FCRS figures for the undercount of farms and the change in wording of the off-farm income question between the 1984 and 1985 FCRS. The sharp jump in the off-farm income figures between 1984 and 1985 is the result of improvements in measuring off-farm income of principal farm operators. See table 6 for more details.

Discontinued Accounts

Two accounts have been discontinued this year, the total cash income account and the net farm income account before inventory adjustment by value of sales class. The total cash income account was dropped because the two components, net cash income and off-farm income, represent income for different populations. Net cash income represents income earned by a farm operation. Several families may share the proceeds from a single farm operation. Off-farm income represents income for the principal farm operator and his or her family.

The net farm income account before inventory adjustment by value of sales class was discontinued because this account did not measure any meaningful economic concept. Net farm income with the inventory adjustment measures the value of the farm sector's production during a calendar year. A satisfactory method of distributing inventory adjustment by sales class is not available. Without the inventory adjustment, neither the value of production nor cash income is measured.

Sales Class

The income tables by value of gross sales have been restructured and the lowest two sales classes, farms with \$5,000 to \$9,999 and less than \$5,000, have been combined. As noted earlier, the net farm income account by sales class has been discontinued due to the absence of data on inventory adjustment by sales class.

Approximately 25 benchmarks derived from the 1987 Census of Agriculture have been incorporated into the income accounts by value of sales class for 1982-89. ERS analysts interpolated between the 1982 and 1987 census benchmarks using a better method of interpolation. Where possible, items used to distribute U.S. figures across the sales classes were improved. For example, ERS analysts last year had used the value of buildings in each sales class to distribute the building repair and maintenance expenses and the value of machinery to distribute machinery repair and maintenance expenses. The repair and maintenance expense question on the 1987 Census of Agriculture allowed ERS analysts to use those data to distribute our figure on repair and maintenance.

Balance Sheet Changes

A number of changes have been incorporated into this year's balance sheet estimates. Benchmarks were updated using 1987 Census of Agriculture data. Also, data from the FCRS and the 1988 Agricultural Economics and Land Ownership Survey (AELOS), a follow-on survey to the 1987 Census of Agriculture, have been incorporated into the procedures for allocating assets and debt by State and over the various sales classes. Significant revisions were made to total real estate values back to 1982 and to motor vehicles and other machinery inventory values back to 1978.

Inventory values of purchased inputs, based on the FCRS, have been added as an asset category. Since the FCRS is a survey of owner-operators, the data are adjusted to incorporate the landlord share as found in the 1988 AELOS. This data series starts in 1984, the first year of available data from FCRS.

Financial assets are now presented in only two categories, net worth of farm cooperatives and other financial assets, because the benchmarks used to subdivide the other financial assets are outdated. In accordance with the reorganization of the Farm Credit System, real estate debt of the Federal land banks is now included in Farm Credit System debt. Likewise, nonreal estate debt for the Production Credit Associations and Federal intermediate credit banks are now combined as Farm Credit System debt.

Building values (including values of dwellings and farm service structures) are now based on annual FCRS data for 1984-89, rather than estimated traditionally as a proportion of total farm real estate value. Adjustments are made to the FCRS data to fully account for the difference between FCRS's and USDA's number of farms and to incorporate the landlord share as estimated in the 1988 AELOS. The 1989 FCRS was designed so that the value of dwellings owned by farm operations can now be estimated separately for operator, hired labor, and other dwellings. Thus, the new category, other dwellings, was added to

the land and buildings table (table 47). The relationship between land and building values and other dwelling values was revised for 1984 forward. Compared to the previously used relationships based on 1979 Farm Finance Survey data, the FCRS-based building values are a substantially larger proportion of total real estate values. Thus, there is a discontinuity in the building value series beginning in 1984. The relationship between land and farm building values is a high-priority research item within ERS for the next year. So, the values of dwellings, service structures, and land should be considered tentative and subject to change until

further analyses of related data sources are completed.

The effect of larger dwelling values for 1984-88 is also evident on the debt side of the balance sheet, where the difference between including and excluding household accounts has increased. The amount of real estate debt attributable to dwellings is a function of dwelling values. Larger dwelling values have led to larger estimates of the debt associated with the dwellings. This procedural change has caused a discontinuity between 1983 and 1984 in our real estate debt series.

NA = not available. 1/ See tables 3-6 for components of income accounts. It is inappropriate to divide the net income figures by the number of farms to measure the average net income received by farm operators. Proceeds from a farm operation may be shared by several families and a family may be involved in several farming operations. 2/ New computational procedures and data sources are used in deriving the gross imputed rental income and expenses related to farm dwellings for 1984 and later years. 3/ Off-farm income is computed only for the principal farm operator and his or her family. 4/ Includes operator households. See table 45 for components of balance sheet accounts.

^{1/} Net farm income measures the value of agricultural production for the calendar year. Components may not add to totals due to rounding. See tables 7-10 for components. 2/ In a change in the estimation procedures affecting both cash receipts and the value of inventory adjustments for those crops in the CCC loan programs, loan placements and redemptions are incorporated separately rather than the net difference. In recent years the Government has offered incentives that encourage loan redemption in the same year as placements. The change in procedure has little effect on gross farm income as the change to receipts and inventories within a year tend to be offsetting. 3/ New procedures and data sources are used in computing the gross imputed rental income and expenses related to farm dwellings for 1984 and later years. See footnotes to tables 8, 9, 10, and 25 for more details.

^{1/} The production transactions account estimates the distribution of gross receipts to the factors of production. Returns to operators for their labor, management, land, and capital are calculated as the residual. 2/ See table 7. 3/ See table 8. 4/ See table 25. 5/ See table 10.

^{1/} Net cash income measures the income from a farm operator's farm business and net cash flow measures the cash flow within the agricultural sector. Components may not add due to rounding. 2/ See tables 7 and 9 for components. 3/ See table 52 and 54 for components. Excludes operator households. 4/ See table 50 for components. Excludes operator households. 5/ See table 27 for components.

NA = not available. 1/ This measure of income is conceptually consistent with the cash accounting method used by most farm operators; however, operators employ a variety of depreciation methods and assumptions about the useful lives of capital assets. 2/ Off-farm income should not be added to any of the farm income figures because off-farm income is reported only for the principal farm operators and their families while farm income is reported for all families sharing in the farm earnings. A farm may have more than one operator. 3/ The 1979 off-farm income was benchmarked to the 1979 Farm Finance Survey and 1984's figure benchmarked to the 1984 Farm Costs and Return Survey (FCRS). Both surveys asked farmers to report the dollar amount of their off-farm income. Estimates between 1979 and 1984 were derived by moving the 1979 figure forward using annual U.S. level percent changes in per capita personal income. Starting with 1985, the FCRS listed ranges for off-farm income and asked farmers to report the appropriate range. As the result of the change, more farmers reported their income.

NA = not available. 1/ Forest products included in cash receipts prior to 1978 and in farm-related income thereafter. 2/ See tables 14 and 15. 3/ See table 24. 4/ Includes only recreational income through 1973. In 1974, includes recreational income, dividends from cooperatives, and all other farm-related income. In 1982, custom feeding fees were deleted from the net rent account and added to the other farm-related income category.

^{1/} Value of farm products consumed directly by farm households where produced. 2/ This imputed noncash income is included because farm dwellings are a component of farm assets, and farm businesses incur dwelling expenses. For 1983 and earlier years, imputed rent is computed by the user cost of capital approach. For 1984 and later years, market data on rents from the Residential Finance Survey and dwelling values from the Farm Costs and Returns Survey are used to compute the rental value of onfarm dwellings. 3/ Total excludes inventory adjustment.

^{1/} A new computational procedure for depreciation and accidental damage on operator dwellings was implemented for 1984 and later years. The revised depreciation rate is lower than the previous rate. 2/ Includes cash expenses for insurance and retirement plans before 1978. 3/ See table 28 for estimates by type of capital item.

^{1/} Except where noted in footnote 2, all ratios include operator households. 2/ Excludes operator households. 3/ The ratio of the sum of net farm income, taxes paid, and interest paid, divided by interest paid. 4/ The financial leverage ratio is the rate of return to equity from current income divided by the rate of return to assets from current income. 5/ The ratio of cash receipts to the value of land, buildings, and machinery.

^{1/} Includes Commodity Credit Corporation loans made minus loans repaid, but excludes loans liquidated (forfeited or charged off). Includes major commodity income estimates for which USDA publishes State production statistics, plus minor States for which production estimates are not published and minor commodities for which no production estimates are published. Adjustments are also made in "Other" categories for commodities for which publication may violate confidentiality rules. 2/ Includes value of home consumption. 3/ Includes all berries for which USDA does not estimate individual values of production.

See footnotes on next page.

Footnotes for Table 25

NA = not available.

- 1/ Components may not add due to rounding. Expenses for operator dwellings are included in the indicated columns only if the operator dwelling is located on the farm.
- 2/ Includes bulbs, plants, and trees.
- 3/ Includes only the proportion used in the farm business.
- 4/ Insurance, registration fees, and licensing fees for automobiles and trucks are included in the repair and maintenance account before 1978. These items are included in the miscellaneous expense account for 1978 and later years. After 1983, data on repairs and maintenance for operator dwelling are derived from the Farm Costs and Returns Survey. See table 26 for estimates by type of capital item.
- 5/ Marketing, storage, and transportation expenses for 1978 and later years are based on the Farm Costs and Returns Survey and are for all crops and livestock. Estimates before 1978 are based on various data sources and include only expenses for fruit and vegetable containers, cotton ginning, livestock marketing, and milk hauling. Estimates are not compatible between the two periods.
- 6/ Miscellaneous expenses for 1978 and later years are based on the Farm Costs and Returns Survey. Items included from 1978 forward are health and breeding services and supplies, custom feeding and grazing, irrigation water costs, dairy assessment fees, farm supplies, tools, noncapital equipment, net insurance including motor vehicles, motor vehicle registration and licensing fees, telephone and water, and other farm business management expenses. Other miscellaneous livestock purchases and livestock rental fees are included beginning in 1982. Estimates before 1978 are based on various data sources and include expenses for binding materials, dairy supplies, net Federal Crop Insurance Corporation payments, other net insurance excluding motor vehicles, greenhouse and nursery, grazing, harness and saddlery, blacksmithing and hardware, small handtools, telephones, veterinarian fees and supplies, and other miscellaneous expenses. Estimates are not compatible between the two periods.
- 7/ The sum of intermediate product expenses and contract and hired labor expenses.
- 8/ Contract labor wages and contractor fees are included in cash wages to hired labor for 1945-58. Social Security paid by contractors is included in Social Security for hired labor for 1951-58.
- 9/ Before 1978, includes the value of in-kind items (board, lodging, transportation, and food) and cash expenses (medical and life insurance, and pension and retirement plans). For 1978 and later years, includes only in-kind items. Other benefits that are cash expenses to the operator are included in cash wages. Procedures and data sources for 1982 and later years are not strictly compatible with those before 1982.
- 10/ After 1983, gross rent to landlords is based on data from the Farm Costs and Returns Survey. Gross rent to landlords for 1979-83 is based on data from the 1979 Farm Finance Survey. Gross rent to landlords for 1978 and earlier years is based on various data sources. Net rent estimates are not consistent among the three periods.
- 11/ Depreciation and accidental damage. New computational procedures for depreciation and accidental damage on operator dwellings were implemented starting with 1984. Revised depreciation rates are lower than previous rates. Estimates are not compatible between the two periods. See table 28 for depreciation by type of capital item.
- 12/ Real estate and personal property taxes. Starting with 1984, property taxes for operator dwellings are computed from data on the Farm Costs and Returns Survey.

^{1/} Repairs and maintenance only. The value of gross capital expenditures which includes the value of new construction, additions, and major improvements appears in table 27. 2/ Share of capital items used in the farm business. 3/ Operator dwellings located on farm real estate only. 4/ Includes fences, windmills, wells, dams and ponds, terraces, drainage ditches, tile lines, other soil conservation facilities, and dwellings not occupied by farm operators. 5/ Insurance, registration fees, and licensing fees for automobiles and trucks are included in the repair and maintenance account before 1978. These items are included in the miscellaneous expense account for 1978 and later years.

^{1/} Current replacement cost, not original cost. 2/ Share of capital items used in the farm business. 3/ Excludes minor types of equipment charged to the miscellaneous expense category of table 25. 4/ Operator dwellings located on farm real estate only. New methods and data are used for computing operator dwelling depreciation beginning with the 1984 figures. Revised depreciation rates are lower than previous rates. Estimates are not compatible between the two periods. 5/ Includes fences, windmills, wells, and dwellings not occupied by farm operators. Land improvements are not depreciated.

^{1/} Starting with 1985 the survey question on off-farm income was changed so that farmers reported the appropriate range of their off-farm income rather than their actual income. As the result of the change in the question, more farmers reported their off-farm income. See footnotes for table 6 for more information.

Value of Agricultural Sales Class Estimation Note

The categorization of farms into sales classes is based on the gross market value of all agricultural products that are sold, placed under the CCC loan program, or otherwise removed from the farm. It includes the gross market value of all products sold regardless of who receives payment. It excludes the value of direct Government payments, farm-related income, and nonmoney income.

The estimates by sales class are based on information from many sources. The majority of data used to compute the sales class accounts are derived from the *Census of Agriculture* and the annual Farm Costs and Returns Survey (FCRS). More specifically, annual farm income and expense items are generally distributed to sales classes based on per farm benchmarks from the last census. Because our data are based on the census our sales class

definitions follow census's definition. Census data are collected every 4 or 5 years, and there is a considerable lag in their availability. Estimates for years following 1987 are based on the 1987 census benchmarks by sales class. Therefore, these estimates may be subject to substantial revisions when data from the next census become available. The distribution of Government payments to sales classes for 1983-89 are based on FCRS survey data.

Because information is not available to prorate inventory adjustment by sales class, the net farm income figures before inventory adjustment along with the gross income and expenses for this account were discontinued. Without the value of inventory adjustment the net farm income account by value of sales class does not measure any meaningful economic concept.

NA = not available. 1/ Data on real estate values for 1940-49 are based on the Census land in farms. Starting with 1950, land in farms is based on the National Agricultural Statistics Service's, August Crop Production report. 2/ Value of real estate, excluding farm households, is the sum of land and service structure values. 3/ Hired labor dwellings are included as part of service structures. 4/ Total real estate value is the sum of land, service structure, and operator and other dwelling values. 5/ Starting with the December 31, 1959 figures, data for Alaska and Hawaii are included. 6/ Beginning in 1981, data for value per acre and real estate value are for April of the following year, and for February of the following year for 1985-88, and for January of the following year for 1989. 7/ Beginning in 1984, building values are derived from the USDA's Farm Costs and Returns Survey.

^{1/} Returns to operators plus net rent received by nonoperator landlords plus interest on real estate and nonreal estate debt. 2/ Estimates for 1970-83 were derived by multiplying the Bureau of Labor Statistics' total hours of operator and unpaid family labor times the average hourly cash wage rate. Estimates for 1984-89 are estimated by multiplying total hours of operator and unpaid family labor, derived from ERS's Farm Costs and Returns Survey, times the average hourly cash wage rate. 3/ Estimated to equal 5 percent of the sum of cash receipts plus net inventory change plus Government payments minus livestock and feed purchases.

For the latest on the 1990 Farm Act--

Just dial 1-800-999-6779. Toll free in the United States and Canada. Other areas, please call 1-301-725-7937.

Ask for *The 1990 Farm Act and the 1990 Budget Reconciliation Act*. Order # MP-1489. \$8.00.

Non-U.S. addresses (including Canada), add 25 percent. Charge your purchase to your VISA or MasterCard, or we can bill you. Or send a check or purchase order (made payable to ERS-NASS) to:

ERS-NASS P.O. Box 1608 Rockville, MD 20849-1608.

We'll fill your order via 1st class mail. We offer a 25-percent discount when you order 25 or more copies to one address.

Still available

You may find another USDA publication (based on the 1985 Farm Bill) useful. Issued in January 1990, it describes in plain English the key concepts of how U.S. farm policy works, including target prices, deficiency payments, export enhancement, FOR, and the CRP.

To order a copy of this 84-page report, ask for *The Basic Mechanisms of U.S. Farm Policy: How They Work, with Examples and Illustrations.*Order # MP-1479. \$6.50.

Call 1-800-999-6779 to order your copies today.

Put Rural Development Research To Work For You

Rural Development Perspectives brings you information that will help you make your rural community or small town a better place to live, get more out of your budget, give you new ideas about developing your area's economy, and help you understand the forces influencing rural development in America in the 1990's.

In each issue:

Feature articles (8-10 of them) give you information you can put to use, not just put on a shelf;

Book Reviews tell you about good new books on rural and smalltown topics;

Short Subjects give you a digest of readings that will broaden your awareness of what matters to rural areas and small towns;

Rural Indicators give you a graphic snapshot of trends affecting you and your community.

Subscription includes three issues. Save money by subscribing for more than 1 year!

Keep current on economic analyses from the U.S. Department of Agriculture with *The Journal of Agricultural Economics Research*.

The Economic Research Service especially tailors this quarterly periodical to the international community of economists, statisticians, academicians, and agribusinesses who want in-depth reporting of contemporary agricultural economics research. Complementing the research articles are book reviews, a valuable source of information to keep you abreast of the latest literature.

JAER reflects the research of USDA employees and researchers under cooperative agreement with the Department. Readers in 54 countries have benefited from its incisive analyses.

Return the form along with your check for \$8.00 (domestic), \$10.00 (foreign-including Canada and Mexico) to ERS-NASS, P.O. Box 1608, Rockville, MD 20850. Make check payable to ERS-NASS. Or phone, toll free, 1-800-999-6779 and charge your purchase to your Visa or MasterCard.
