#### Introduction

The Agricultural Extension Service and the Department of Agricultural Economics of the University of Minnesota, the Tennessee Valley Authority, and the County Extension Services of five counties in central Minnesota are cooperating in a fertilizer demonstration project and in a farm management service. The service was initiated in 1958. It is available to a selected group of farmers who are willing to demonstrate the value of commercial fertilizers and who have agreed to keep farm business records. The authors wish to express their appreciation to the farmers and the Agricultural Extension Agents for their fine cooperation in making this report possible.

The purpose of this report is (1) to show some of the factors affecting farm income, and (2) to obtain data in regard to farm income and expenses for central Minnesota farms.

The project is under the general supervision of Roland Abraham, Roger Harris, and Paul Hasbargen of the Agricultural Extension Service. Analysis of the farm records and preparation of this report are handled by T. R. Nodland, Department of Agricultural Economics, and Paul Hasbargen, Agricultural Extension Service. The following tabulation shows by counties, the county agricultural agents and the number of farm records submitted.

<u>County</u>	<u>County Agricultural Agents</u>	<u>No. of Records</u>
Crow Wing	Glenn Smith and James Rabehl	2
East Otter Tail	Gerald Ness and Sherman Mandt	5
Hubbard	Wm. Dorsey and John Eix	5
Todd	Richard Brand and Loyal Hyatt	3
Wadena	Miles Rowe	5

(1) The authors are indebted to Janet Otis for her assistance in the preparation of this report

## Capital Investment

The average value of capital used per farm is shown in table 1. Capital investment per farm varied from \$58,765 to \$13,863. These data represent "book" values and not necessarily current market values. The common practice for both income tax accounting and farm business analysis is to depreciate capital items each year by an amount equal to their decrease in value as a result of use and obsolescence. Market prices, particularly real estate, have been increasing during the last several years. As a result, the value of farm real estate as shown in table 1 tends to be an understatement of its present market value. This is especially true in cases of farms purchased several years ago.

## Farm Earnings

Farm income in this area of the state is relatively low. The 20 farmers included in this report have average farm sales of \$13,497 and farm purchases of \$10,285, or a net cash income of \$3,212 per farm (table 2). Farm purchases amounted to 76 percent of total farm sales leaving 24 percent to pay family living expenses, interest on indebtedness, and for savings.

Labor earnings, the measure of financial success used in this report, have been computed on a "full owner" basis. Sales and purchases for the whole farm are shown, whether it was operated by an owner or a renter. Labor earnings are the return to the operator for his labor and management after all expenses have been paid, including wages for members of the family other than the operator, and a 5 per cent charge on the average value of capital used in the farm business. This places all farms on a uniform basis for comparison.

Two methods of calculating labor earnings are used. Table 2 shows the earnings statement on a cash basis; table 3 shows the earnings on an enterprise or accrual basis. The main difference in the two statements is in the method of handling the net increase or decrease in farm capital. In the cash statement, the net increase or decrease in farm capital is entered as one item (item 14 or 43, table 2). In the enterprise statement, as shown in table 3, the net change in the inventory has been included in each item in order to compute "total returns and net increase" or "total expenses and net decreases" by enterprises. Thus the average returns and net decreases of \$7,087 from dairy cows includes the value of dairy products sold, fed, and used in the home -- with adjustments for changes in the value of the herd. The following is an illustration using the data for a dairy farm:

Value of dairy products sold	\$6180
Used in the home	225
Fed to livestock	<u>28</u>
Total value of dairy products produced	\$6433
Value of cows on end of year inventory	\$4000
Sales of cows	726
Butchered for home use	<u>0</u>
Total	\$4726
Value of cows on beginning of year inventory	\$4800
Purchases	--
Value of heifers transferred to cow herd	200
Total	<u>\$5000</u>
Net change in value of cows	-274
Returns and net increases from milk cows	<u>\$6159</u>

\* Cash receipts and expenses are adjusted for changes in inventory for each enterprise and for each item of expense.

### Return to Capital and Family Labor

Return to capital and family labor, as shown in table 4, represents the income available to the family. These data represent the operator's share of the farm income. In cases of rented farms, landlord's expenses and receipts have not been included. Interest on indebtedness paid by the farm operator is included as a farm expense. Thus, return to capital and family labor represents the returns to family labor, management, and the operator's equity in the farm capital used in the business.

### Net Worth

Net worth statements for those farmers who kept a complete record of all assets and liabilities are shown in table 5. This is simply a statement of all farm and nonfarm assets that a farmer has, balanced against all notes, accounts, mortgages, etc. that constitute his liabilities. It provides an excellent benchmark which can be used to give a true measure of progress through the year. Without this measure it is difficult for a farm family to judge their financial progress. Debt retirement is often considered to be a farm expense, when in reality it adds to the farmer's net worth by decreasing the amount of his liabilities.

The average net worth of the 17 farmers who kept complete records of assets and liabilities in 1962 was \$29,729. These farmers realized an average increase of \$2,215 in net worth during 1962.

### Family Income and Expenses

Total cash family living expenses for 14 farm families that kept records of these expenditures amounted to an average of \$3,279 per family (table 6). In addition, these families used farm produce valued at \$280, or a total of \$3,559 for cash family expenses plus perquisites. Their average total income available for payment of family living amounted to \$5,014. Thus, the farmers who kept records of family living expenses had an average of about \$1,455 to use for debt retirement or business expansion after all living expenses were met.

### Some Management Factors That Affect Earnings

Some of the variation in earnings from year to year and from farm to farm are due to variations in prices, weather, and other factors over which the farmer has little, if any, control. However, there are many management factors which are largely within the control of a farm operator. Some of these management factors are shown in table 9.

Volume or size of business in terms of work units is probably the most important of these factors. Size of business varied from 793 work units to 202 per farm. Farms with a large business tend to have an advantage in labor efficiency and in control over expenses. A well-balanced crop and livestock program spreads the work load throughout the year and provides for fuller employment of workers.

Control of farm expenses is another important factor. One measure of this is the power, mach., equipment, and bldg. expense per work unit shown in table 9. A second measure is that of power and machinery expenses per crop acre as shown in table 12. Another measure can be determined by calculating the proportion of farm sales needed to cover farm expenses. (Table 2: item 42 ÷ item 13). An average of 70 - 75 percent of the farm sales are usually needed to pay farm expenses. This, however, varies considerably among farmers. High costs relative to gross income holds earnings down on some farms. However, although a farmer should attempt to keep the proportion of farm expenses relatively low, he cannot do this by decreasing those expenses necessary for maintaining an adequate volume of production. Instead, it is usually necessary to increase total expenses in order to increase the volume of sales. The purchase of commercial fertilizers, for example, increases farm expenses. This, in turn, will increase the feed supply under normal weather conditions and make possible the maintenance of a greater number of livestock.

#### EXPLANATION OF "WORK UNITS"

The total "work units" for any one farm is a measure of the size of that farm business. A work unit as used in this report is the average accomplishment of a farm worker, in a ten-hour day, working on crops and productive livestock at average efficiency or ten hours of work off the farm for pay. The number of work units for each class of livestock and each acre of crop are presented in table 8.

Table 8. Number of Work Units for Each Class of Livestock and Each Acre of Crop

Class of Livestock	No. of Work Units	Crop	No. of Work Units
Dairy & dual-purpose cows	10.0 per cow	Small grain	.7 per acre
Other dairy & dual-purpose cattle	3.5 per an. unit*	Truck crops	6.0 per acre
Beef breeding herd	3.5 per an. unit*	Potatoes	3.8 per acre
Feeder cattle	.25 per 100 lbs.	Corn-husked	1.1 per acre
Sheep - farm flock	1.2 per an. unit*	Corn-silage	1.7 per acre
Sheep - feeder	.3 per 100 lbs.	Oat silage	.9 per acre
Hogs	.2 per 100 lbs.	Alfalfa hay	.9 per acre
Turkeys	.5 per 100 lbs.	Other hay	.6 per acre
Hens	20.0 per 100 hens	Legume seed	1.0 per acre

\* An animal unit is based on the amount of T.D.N. consumed. One animal unit thus represents 1 dairy cow or bull, 2 other dairy cattle, 1-1/4 beef cows or bull, 1 feeder steer or heifer, 3-1/3 other beef cattle, 7 sheep, 14 lambs, 2-1/2 hogs, 5 pigs, 50 hens, or 1.100 pounds of turkeys produced.

12	1961	15	5	30	3.08	3.24	.16	-.1.85	.57

(1) Prices used in calculating return from increase in yield over fertilizer cost:

Corn grain - \$1.05 per bu.

Actual nitrogen - \$.15 per pound

Corn silage - \$7.00 per ton

Actual phosphate - \$.10 per pound

Tame hay - \$15.00 per ton

Actual potash - \$.05 per pound

(2) Green weight at harvest.

(3) The year in which fertilizer was applied on oats with seeding.

(4) Usual 2-cutting yield based on one measured cut.

(Note: The average small grain increase in year of seeding paid 60% of fertilizer cost.)
