Highlights

Buyers of grain use premiums and discounts to convey to suppliers the value of quality characteristics. Premiums and discounts are determined by supply and demand for those quality characteristics. This report, the eighth in a series, contains the results of a 1991 survey of pricing and marketing practices used by North Dakota country elevators for durum and hard red spring (HRS) wheat. Results for HRS wheat show that the protein level increased to the highs of 1988 and 1989 and that the premium for 16 percent protein and the discount for 12 percent protein decreased from the previous year. Discounts continued the downward trend of recent years.

PRICING AND MARKETING PRACTICES
FOR NORTH DAKOTA DURUM AND HRS WHEAT:
1991 CROP YEAR

Daniel J. Scherping, Richard D. Taylor,
and William W. Wilson*

Introduction

Buyers of grain use premiums and discounts to convey to suppliers the value of quality characteristics. Premium and discount schedules are determined among individual market participants, according to buyer's quality needs and the distribution of quality characteristics available to the market. Thus, premiums and discounts frequently change as needs of buyers and the availability of grain that possess those characteristics change. Premiums and discounts also change with time, location, and expectation of future market conditions. Individuals in the grain market system must be aware of the price of grain and the value of premiums and discounts when making business decisions.

Since premiums and discounts are important to individual market participants and since premium and discount schedules are rarely published, the Department of Agricultural Economics began to survey North Dakota country elevators in 1984 about pricing and marketing practices for hard red spring (HRS) and durum wheat. The seven previous surveys, listed in the reference, can be obtained from the Department of Agricultural Economics, North Dakota State University (NDSU).

This report, the eighth in a series, contains the results of a 1991 survey and is compared to previous years. The following sections present general characteristics of participating elevators, premiums and discounts, economics of dockage removal, and a summary and conclusion. Reference is made to tables and figures in Appendixes A and B, respectively. The survey questionnaire is contained in Appendix C. The section pertaining to economics of dockage removal also includes major highlights from a recent NDSU study on this topic. Discussion in this report is kept brief and illuminates only major points since the tables and figures are self-explanatory.

General Characteristics of Participating Elevators

Questionnaires were sent to 509 elevators in North Dakota, and 100 usable surveys were returned, giving a respondent rate of 20 percent (Table A1). The following discussion is based on the responding elevators.

Of the responding elevators, two-thirds were classified as co-op elevators (Harvest States line elevators are included in this category) and one-third as investor-orientated firms (IOF) (Table A2). Single-facility (location) elevators comprised 68 percent of the responding elevators. Multi-facility (location) elevators represent

*Research assistant, research specialist, and professor, respectively, Department of Agricultural Economics, North Dakota State University, Fargo.

28 percent of the responding elevators, and 4 percent of the returned surveys did not indicate either category (Table A3).

Load-out capacity indicates the size of the elevator; smaller elevators were more responsive to the 1991 survey than to previous years. Elevators with a load-out capacity of 6 cars per day or less represent 26 percent of the elevators. A majority of the responding elevators had a load-out capacity of 7 to 26 cars per day, representing 53 percent of the elevators (Table A4).

An important competitive factor is the distance to the nearest competitor. Elevators with competition within 5 miles and competition from 6 to 10 miles represented 33 percent and 42 percent of responding elevators, respectively. Elevators with nearest competitor more than 10 miles away represented 25 percent of the elevators (Table A5). These percentages are similar to 1990.

Storage capacity of responding elevators is less than in previous years. Responding elevators are evenly distributed across the storage capacity range, except for the 400,000 to 999,000 bushel range, representing 34 percent of the responding elevators (Table A6).

Harvest States continued to be the largest purchaser of durum and HRS wheat with market shares at 40 percent and 34 percent, respectively. Benson-Quinn lost market shares in both durum and HRS wheat while Cargill gained in both commodities from the previous year (Table A7).

The market share held by IOF and co-ops varied greatly across crop reporting districts (CRD - Figure B1) from the previous year. However, Harvest States generally held the largest market share across CRDs for both classes of wheat (Table A8).

Atwood-Larson and Benson-Quinn lost market shares in both durum and HRS from IOF, while Kellogg and Cargill increased market shares. Harvest States continued to dominate purchases from co-op elevators for both durum and HRS wheat (Table A9).

Market share varied according to elevator storage; Harvest States generally was the largest purchaser. One of the commission firms (Atwood-Larson, Benson-Quinn, or Kellogg) or Peavey held the second largest market share - with three exceptions: Harvest States and the "Other" category held 90 percent and 10 percent, respectively, of the durum market from elevators with a 99,000 bushel or less storage capacity. Cargill was the second largest purchaser of durum and HRS wheat from elevators with a 1 million bushel or more storage capacity (Table A10).

Individual IOFs' and co-ops' market shares, categorized by load-out capacity, also varied greatly from the previous year. Harvest States' market share increased substantially for both durum and HRS wheat for elevators with a load-out capacity of 6 or less cars per day and elevators that could load out more than 54 cars per day (Table A11).

Premiums and Discounts

Premiums and discounts, relative to the base price of the commodity, are an important component of the grain's total price. Elevators located in eastern North Dakota (CRD #3, #6, and #9 - Figure B1) tended to have higher prices for US #1 hard amber durum and US #1 DNS 14% protein (Table A12). Higher prices in eastern North Dakota largely reflect transport rate differentials.

Results from the 1991 durum and HRS wheat crop quality survey are shown in Table A13. Test weight decreased and the percent of shrunken and broken kernels increased from 1990 for both classes of wheat. The average protein level of HRS wheat increased to levels similar to 1988 and 1989 crops. Figure B2 shows that the protein level of hard red winter (HRW) wheat grown in Kansas also increased from 1990. Associated with the increased protein level in both HRS and HRW wheat was a decrease in the protein premium for both wheats (Figure B3).

Figures B4 to B6 show the discounts for selected grade factors over the years for both durum and HRS wheat. Figures B7 to B23 show how premiums and discounts varied in 1991. A spike in the figure indicates the prevalence of a particular premium or discount.

Average premiums and discounts since 1984 are given in Table A14. All discounts for durum in 1991 were equal to or less than discounts since 1987, except for the discount of 14.5% moisture, which increased slightly. The premium for 16 percent HRS decreased substantially from 1990 as had the discount for 12 percent HRS. The premium for 16 percent protein HRS and the discount for 12 percent protein HRS were similar to 1989 levels, which were low compared to other years.

The premium for 16 percent protein HRS wheat was larger in CRD #1, #4, and #7; also, the discount for 12 percent protein HRS wheat was larger in these three CRDs compared to the other CRD. This is just the opposite from 1990 (Table A15).

The difference in the premium and discount schedule, based on the ownership of the elevator (co-op and IOF), load-out capacity, miles to nearest competition, and storage capacity did not appear to differ greatly (Tables A16, A17, A18, and A19). The only noticeable difference is that co-op elevators generally discounted HRS less than did IOF (Table A16).

Economics of Dockage Removal

NDSU, in cooperation with the Economic Research Service (ERS), completed a major study titled "Economics of Alternative Regulations on Wheat Cleaning in Hard Red Spring, Durum, and White Wheat." Four reports pertaining to different aspects of the cleaning decision were produced under this study and are listed in the References. Copies can be obtained from the Department of Agricultural Economics, North Dakota State University.

The first publication, "Wheat Cleaning Costs and Grain Merchandising," reports on why and where wheat is cleaned, the cost of cleaning at various locations, and merchandising practices. The second publication, "Wheat Cleaning Decisions at Country Elevators,"

is an analysis of blending and cleaning at country elevators. The third publication, "Measuring the Impact of Dockage on Foreign Demand for U.S. Wheat," illustrates an integrated export-import model, which can be used to evaluate the impact of dockage on import demand and U.S. export revenue. The fourth publication, "Impacts of Alternative Policies Regulating Dockage," summarizes the three previous reports and analyzes different ways to regulate dockage and the economic impact of those regulations.

Results from the NDSU/ERS study indicated that 89.6% of elevators in the spring wheat production region own and operate cleaners, while only 14.9% of the elevators in the white wheat production region owned and operate grain cleaners (Scherping et al. 1992c). A survey of elevator managers indicated that the cost of cleaning increase as wheat is cleaned to lower dockage levels (Figure 1).

Two important factors that influence the cost of cleaning vary greatly across elevators: the cleaner's utilization rate and the amount of wheat lost during the cleaning process. Economic-engineering cost estimates were derived to show the impact of certain variables on the cost of cleaning, including utilization rate and wheat loss. Grain cleaner ownership involved relatively large fixed costs compared to variable costs; thus, managers who match cleaning capacity with the amount of grain cleaned annually have lower total cleaning costs (Figure 2). The amount of wheat lost during cleaning directly impacts the cost of cleaning (Figure 3). Any wheat removed with the dockage will represent a loss to the elevator, because of the price difference between screenings and wheat.

Figure 3. Effects of Wheat Loss on Cleaning Costs, With Beginning and Ending Dockage Levels of 3% and 0.7%, Respectively, 1991

Note: Cost calculated for Cleaner A.

SOURCE: Scherping et al. (1992c).

The responding elevators cleaned about 68 percent of the wheat that they handled in 1991, with an average cleaning capacity of 1,987 bushels of wheat per hour. Cleaning capacities ranged from 200 to 24,000 bushels per hour. Wheat delivered during harvest had to have a higher percentage of dockage before managers would clean; and, when it was cleaned, it was not cleaned as intensively as wheat delivered post-harvest. On average, a dockage level of 1.96 percent or less at harvest and 1.59 percent or less post-harvest was considered clean, and managers did not clean this wheat. When wheat was cleaned, it was cleaned to 0.99 percent and 0.84 percent dockage levels during harvest and post-harvest, respectively.

Wheat is cleaned because of economic incentives. Two incentives that are significant and easy to measure are revenue from the sale of screenings and reduced transport costs. These two incentives combined with the cleaning cost yield a "cleaning margin." The average cost of cleaning was 3.79 cents per bushel, and the average price received for screenings was \$24.90 per ton in 1991 (Table A20).

A simple algebraic equation is used to illustrate the derivation of the cleaning margin associated with dockage removal. It is assumed that no wheat is lost during cleaning and contract specifications do not influence the cleaning decision. Given these assumptions, the following equation yields a cleaning margin:

$$(BD - ED)(S + T) - (C) = \text{cleaning margin}$$

where

BD = beginning dockage level (%)

ED = ending dockage level (%)

S = price received for wheat screenings (¢/bu)

T = cost of transportation from elevator to destination
(¢/bu)

C = cost of cleaning wheat (¢/bu)

Figure 4 illustrates how the cleaning margin changes with screening values and beginning dockage levels. The cleaning margin is directly related to screening values and incoming dockage levels. Also, the cleaning margin is positively related to transport costs.

Summary and Conclusions

Premiums and discounts, like wheat price, change with respect to time, location, and current and perceived market conditions. Buyers use premiums to reflect the value of desired characteristics, and discounts to reflect the value of undesirable characteristics. The 1991 durum and HRS wheat crops compares favorably with previous years with one notable exception: the level of shrunken and broken kernels

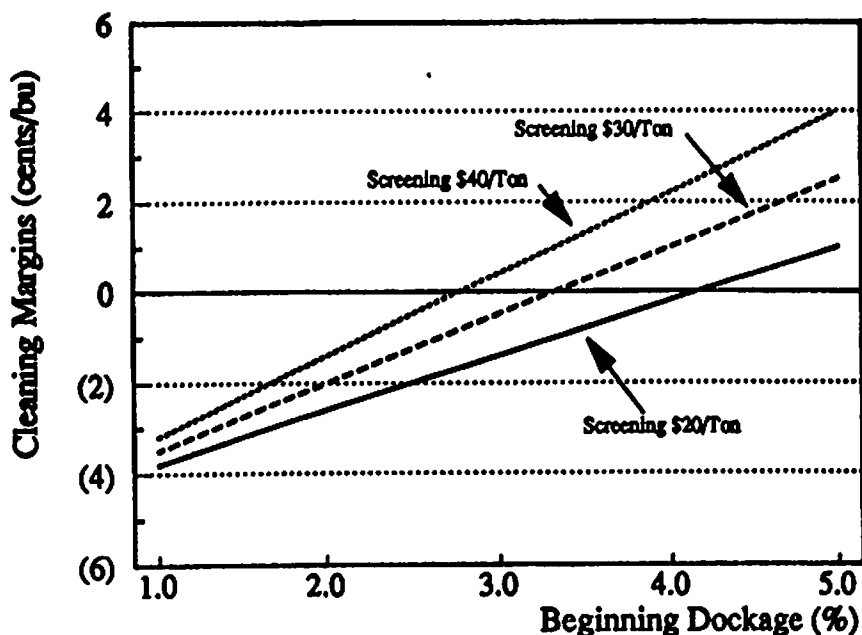

Figure 4. Cleaning Margins With Specified Screening Values, Beginning Dockage Levels and Ending Dockage Level of 0% and a Cleaning and Transport Cost of \$.05/Bu and \$.60/Bu, Respectively

SOURCE: Scherping et al. (1992c).

was greater in durum than in any of the previous years. All discounts for durum in 1991 were equal to or less than discounts since 1987, except for the discount for 14.5% moisture, which increased slightly.

The 1991 HRS and HRW wheat protein levels increased from 1990. The premium for 16 percent HRS decreased substantially from 1990; also, the discount for 12 percent HRS decreased. The premium for 16 percent protein HRS and the discount for 12 percent protein HRS are similar to 1989 levels, which are low compared to other years.

Grain cleanliness (dockage level) has become an issue of increasing interest and can be changed through cleaning. A NDSU study indicated that country elevators in the spring wheat region clean wheat because it is a profitable activity. Cleaning is not as apparent in other regions of the United States, indicating that it is not as profitable elsewhere.

GRAIN MARKETING QUESTIONNAIRE

(Fall 1991)

1. Name of firm _____

2. Location of firm _____

3. a. This elevator is a:
- _____ (a) Locally owned cooperative elevator
 - _____ (b) Harvest States line elevator
 - _____ (c) Locally owned private elevator
 - _____ (d) Line elevator of a large private company
 - _____ (e) Other _____

- b. This elevator is:
- _____ (a) a single facility (location) elevator
 - _____ (b) part of a multi-facility (location) elevator

4. What is the largest number of rail cars that your elevator can load in one day?

- _____ (a) Less than 6 cars
- _____ (b) Between 7 and 26 cars
- _____ (c) Between 27 and 54 cars
- _____ (d) More than 54 cars

5. How far away is your nearest competition?

- _____ (a) Less than 5 miles
- _____ (b) 6 to 10 miles
- _____ (c) More than 10 miles

6. What is the total plant storage capacity at this facility? _____ bushels

7. What were the major commission companies or track buyers you sold your durum and HRS wheat through and the approximate percentage of sales to each (over the past year)?

<u>Name</u>	<u>Approximate Percent of Sales</u>	
	<u>Durum</u>	<u>HRS Wheat</u>
a. Harvest States	_____	_____
b. Peavey	_____	_____
c. Cargill	_____	_____
d. Atwood-Larson	_____	_____
e. Benson-Quinn	_____	_____
f. Kellogg	_____	_____
g. Continental	_____	_____
h. IMF	_____	_____
i. North Dakota Mill	_____	_____
j. _____	_____	_____

8. What percentage of your wheat is cleaned before shipment? _____%

9. At what dockage percentage do you not clean wheat?

Harvest _____ Postharvest _____

10. How many bushels can you clean per hour? _____

11. To what dockage percentage level do you clean your wheat?

Harvest _____ Postharvest _____

12. What would you estimate your cleaning costs to be in cents per bushel? _____

13. How do you dispose of most of your screenings (check one):

- _____ sold to feed market
_____ used in your own feed mill
_____ disposed as waste
_____ other

14. What average price do you receive for wheat screenings? _____

15. What was your board price for #1 Hard Amber Durum (milling) on January 16, 1992? _____

16. What are your discounts for durum which grade the following values?
(Base grade = #1 HAD)

- a. 58 lb. Test Weight _____ ¢/Bu.
b. 14.5% Moisture _____ ¢/Bu.
c. Amber Durum (color) _____ ¢/Bu.
d. 4% Total Damaged Kernels _____ ¢/Bu.
e. 1% Foreign Material _____ ¢/Bu.
f. 5% Shrunken & Broken Kernels _____ ¢/Bu.
g. 2% Contrasting Classes _____ ¢/Bu.
h. 5% Wheat of Other Classes _____ ¢/Bu.
i. Variety: Premium (+) - Discount (-)
 Monroe _____ ¢/Bu.
 Medora _____ ¢/Bu.
 Renville _____ ¢/Bu.
 Other varieties _____ ¢/Bu.
j. Other _____ ¢/Bu.

17. What was your board price for #1 DNS 14% protein on January 16, 1992? _____

18. What are your discounts and premiums for HRS wheat which grade the following values? (Base grade = #1 DNS 14% protein)

- a. 57 lb. Test Weight _____ ¢/Bu.
b. 14.5% Moisture _____ ¢/Bu.
c. 16% Protein _____ ¢/Bu. (tested 12% moisture)
d. 12% Protein _____ ¢/Bu. (tested 12% moisture)
e. 4% Total Damaged Kernels _____ ¢/Bu.
f. 1% Foreign Materials _____ ¢/Bu.
g. 5% Shrunken & Broken Kernels _____ ¢/Bu.
h. 2% Contrasting Classes _____ ¢/Bu.
i. 5% Wheat of Other Classes _____ ¢/Bu.
j. Other _____ ¢/Bu.

19. Would you like a copy of last year's report? _____ Yes _____ No

20. Would you like a copy of this year's report? _____ Yes _____ No
