### **IMPORTANT NOTICES**

#### **Copyright/Permission to Reproduce**

Materials in this publication were produced and/or compiled by Agriculture and Agri-Food Canada for the purpose of providing Canadians with direct access to information about the programs and services offered by the Government of Canada.

The material in this publication is covered by the provisions of the Copyright Act, by Canadian laws, policies, regulations and international agreements. Such provisions serve to identify the information source and, in specific instances, to prohibit reproduction of materials without written permission.

#### **Non-commercial Reproduction**

Information in this publication has been provided with the intent that it be readily available for personal and public non-commercial use and may be reproduced, in part or in whole and by any means, without charge or further permission from Agriculture and Agri-Food Canada. We ask only that: Users exercise due diligence in ensuring the accuracy of the materials reproduced; Agriculture and Agri-Food Canada be identified as the source department; and the reproduction is not represented as an official version of the materials reproduced, nor as having been made, in affiliation with or with the endorsement of Agriculture and Agri-Food Canada.

#### **Commercial Reproduction**

Reproduction of multiple copies of this publication, in whole or in part, for the purposes of commercial redistribution is prohibited except with written permission from the Government of Canada's copyright administrator, Public Works and Government Services Canada (PWGSC). Through the permission granting process, PWGSC helps ensure individuals/organizations wishing to reproduce Government of Canada materials for commercial purposes have access to the most accurate, up-to-date versions. To obtain permission to reproduce materials in this publication for commercial purposes, please consult with PWGSC.

## *Foreword*

The purpose of this document is to describe the features of the Agriculture and Agri-Food Canada (AAFC) Medium Term Outlook for Canadian Agriculture covering the period 2008 to 2018. The outlook is an attempt to outline a plausible future of the international and domestic agri-food sectors. It serves as a benchmark for discussion and scenario analysis.

The outlook makes specific assumptions and outlines their implications. Since it assumes that policies remain unchanged from existing legislation, the outlook is not a forecast of future events. In particular there are no assumptions made regarding the outcome of the Doha round of trade negotiations. Finally, it is assumed that there will be no significant animal disease outbreaks or unusual climatic conditions over the period of the outlook.

The outlook was produced with two econometric models of agricultural markets based upon information available in **November 2008**. The AGLINK/COSIMO model of the Organization for Economic Cooperation and Development (OECD) and of the Food and Agriculture Organization (FAO) was used to produce the international outlook and the AAFC Food and Agriculture Regional Model (FARM) was used for the national outlook.

The medium term assumptions used and published by the OECD/FAO in the Agricultural Outlook 2008-2017 are by in large maintained in the AAFC's outlook but updated to reflect short term price forecasts produced and released by the U.S. Department of Agriculture (USDA) in November 2008. The November 2008 macroeconomic forecast published by the International Monetary Fund (IMF) was also incorporated in the outlook and in particular a 32% reduction in the crude oil price in 2009. AAFC assumed that 3 years will be necessary before the crude oil price returns to the level used in the OECD/FAO medium term outlook. **The outlook for crop year 2008-09 and 2009-10 may not coincide with the forecast published in AAFC January Bi-Weekly Bulletin because this publication takes into account more recent information.**

The Canadian macro-economic forecasts for 2008 to 2013 are from the Conference Board of Canada outlook published in December 2008 except for the crude oil price and the exchange rate in 2009, 2010 and 2011 which reflects the IMF outlook. The average year-to-year percentage change over that period is used for the remainder of the outlook period for each macro-economic variables used in FARM.

# INTERNATIONAL MARKETS

## *Macroeconomic assumptions*

- The world population is expected to grow by slightly more than 1% per year. Growth in developing countries is anticipated to be almost three times higher than in the OECD and as a result the OECD share of world population should fall from 18.2 to 17.1%.
- World gross domestic product (GDP) growth will be sliding from 5% in 2006 and 2007 to 3.7 and 2.2% respectively in 2008 and 2009. The GDP of the OECD should be declining in 2009 for the first time in the postwar period and should be slightly above 2% for the remaining years of the outlook. Growth of the emerging and developing economies is also falling but remains above 5% even in 2009. Growth in China, Russia, South Africa and India is expected to be the strongest.
- The inflation rate should jump to 3.6% in 2008 as the OECD economies absorb the higher commodity prices. With their recent decline, inflation should fall to 1.4% in 2009 and remains slightly above 2% for the remaining years of the outlook. Inflation will be much stronger in the emerging and developing economies with 9.2% in 2008 and 7.1% in 2009.
- Most major currencies have continued to appreciate against the U.S. dollar in 2008. The recent fluctuations in exchange rates as a result of the turmoil in the financial markets have not been taken into account. The exchange rate of Australia, Canada, Mexico, Korea, Japan, Argentina, Brazil and Russia are assumed to be constant in real terms over the medium term. The euro is assumed to depreciate but from a very high level. The exchange rate of all other developing countries is assumed to depreciate by 2% in real terms per year from 2010 to the end of the outlook except the Chinese yuan which should appreciate by 2% per year.
- The price of crude oil is assumed to fall to 69 U.S.\$/barrel in 2009 and to gradually return to 95 U.S.\$/bbl by 2012 and remain stable in real terms in the subsequent years of the outlook.

## *Foreign policies*

- The country of origin labeling (COOL) is implemented on the 30th of September 2008 by the U.S. The new U.S. Average Crop Revenue Election (ACRE) will be in place as of the 2009 crop year.
- The mandatory 10% set-aside of arable land in the EU has been eliminated over the entire outlook period. The gradual increase and the elimination of the milk production quota in the EU are not included in the outlook.
- A tax of 35% is imposed on Argentinean oilseed exports for the duration of the outlook.
- Russian grain exports are not affected by export taxes.
- China maintains value added taxes on grains traded and corn and wheat imports are much smaller than their respective TRQs.
- Mexican direct and procampo payments are assumed to be stable in nominal terms.
- Restrictions on Korean beef imports in relation to bovine spongiform encephalopathy (BSE) are eliminated.

## Biofuel markets

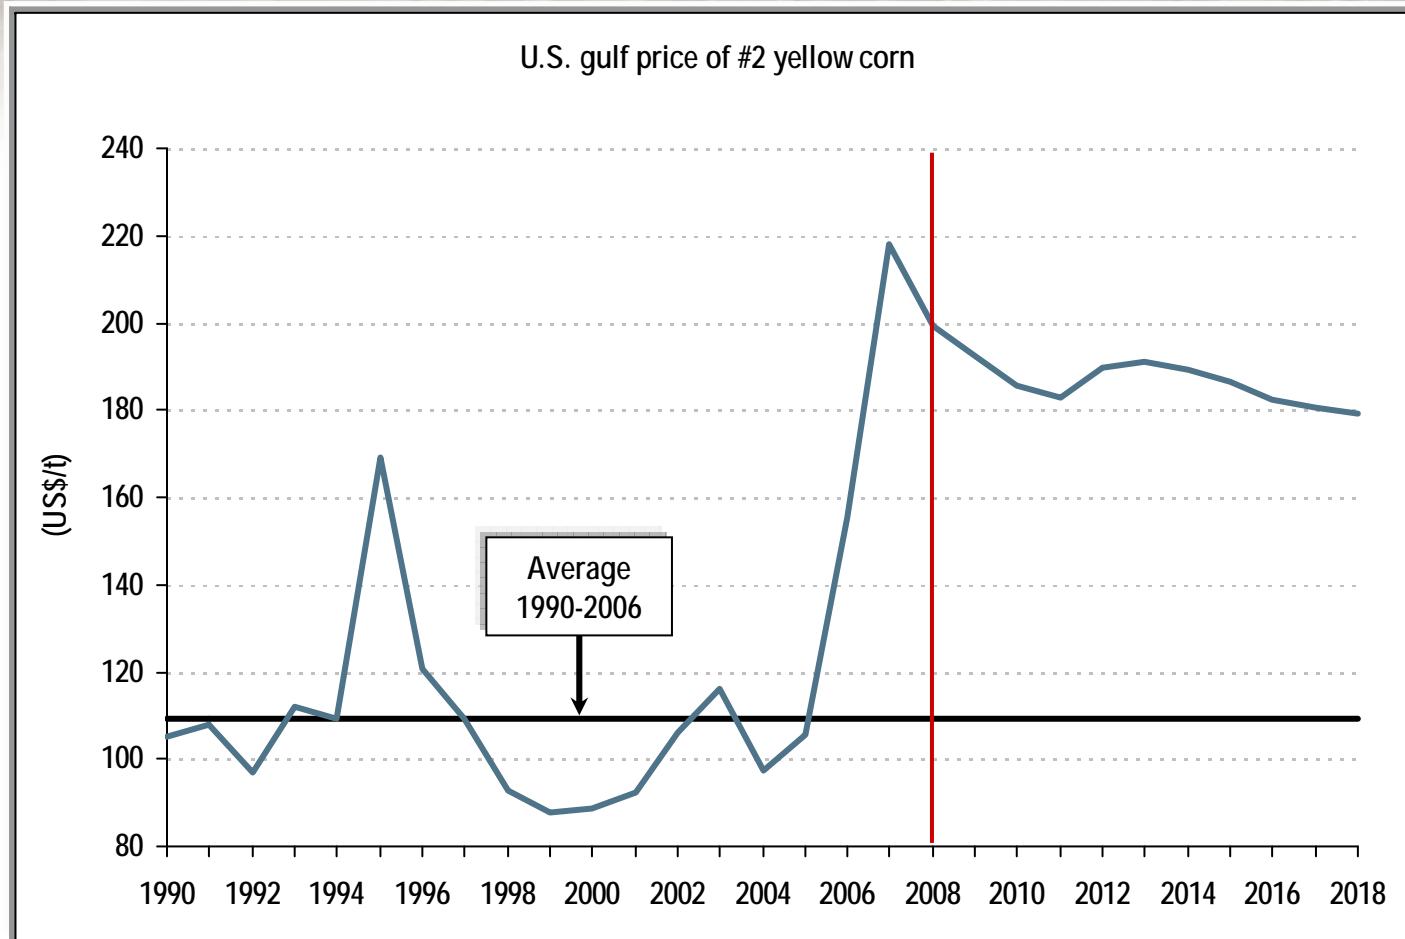

- It is assumed that all the yearly renewable fuel mandates announced by the U.S. in December 2007 will be at least reached over the outlook period.
  - ❖ By 2015 the U.S. will be consuming 56.7 billion liters of corn based ethanol and will be producing slightly more because Canada will be a net importer.
  - ❖ By 2018 the U.S. will be producing and consuming 26.5 billion liters of cellulosic ethanol of which 50% is assumed to be from crop residue, 25% from switch grass grown on land not suited for food crop production while the remaining 25% will be switch grass grown on land that would otherwise have been used for cereals and oilseeds production.
  - ❖ The bio-diesel mandate established at 3.78 billion liters will be met by 2012 and consumption will remain at that level after 2012. Most of the mandate will be fulfilled by local production of which 27% will be from tallow and inedible animal fat.
  - ❖ By 2018, 11.3 billion liters of ethanol will also be consumed under the other advanced biofuels mandate. This mandate will initially be met by imports of dehydrated Brazilian ethanol from the Caribbean until it gradually reach the tariff rate quota (7% of U.S. ethanol consumption) in 2016. The rest of the other advanced biofuels mandate will be mostly fulfilled by imports of ethanol from sugar cane produced in the Caribbean and Central American countries. These imports will not be significant until 2017.
- As announced in the Farm Bill, the ethanol tax credit will be reduced from 13.5 to 11.9 U.S. cents per liter in 2009.
- Price of other advanced biofuels will be higher than corn based ethanol because it will reflect the next lowest cost of producing ethanol in the U.S., i.e. from wheat. It will however not be high enough to allow direct imports from Brazil. Price of cellulosic ethanol will be even higher in spite of technological progress.
- The corn based ethanol mandate in the U.S. will be binding on a permanent basis by 2010 and as a result blenders will be forced to increase the price of gasoline in order to finance the losses on ethanol. In this situation the link between crude oil and corn price will be weaker.
- The European union biofuel consumption will gradually reach 5% of transport fuel (net energy basis). Imports will count for 50 and 22% of consumption respectively in 2010 and 2018.
- World biofuels production should increase from 75 billion liters in 2007 to 190 in 2018.

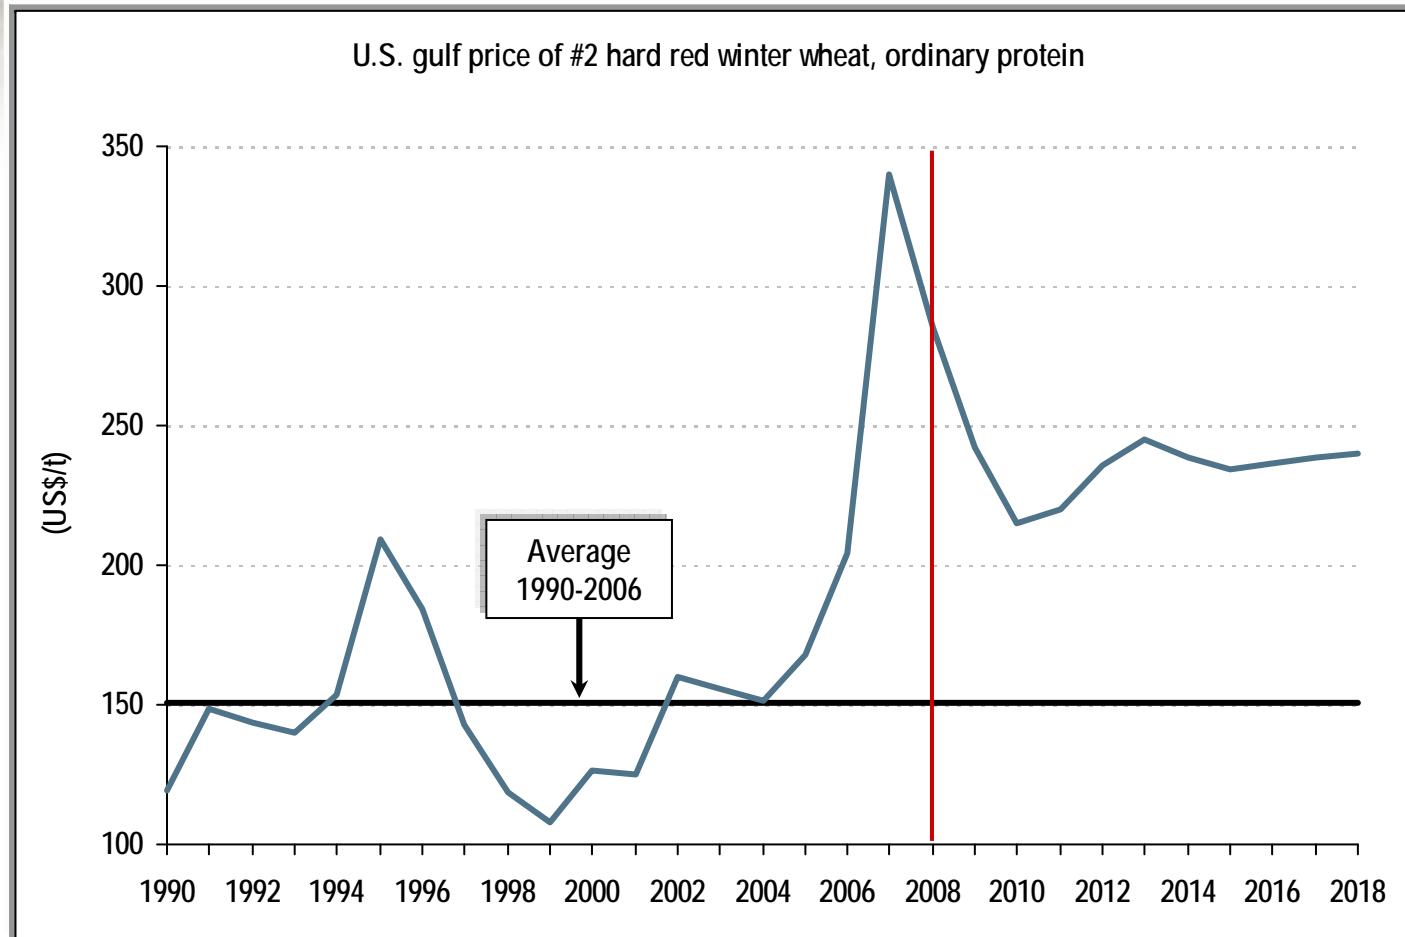

## Highlights

- The world economic downturn in the short term and the sharp increase in world crop production resulting from last year's record prices combined with favorable weather will lead to a strong decline in world prices in 2008-09. The anticipated economic recovery in 2010, a gradual return to a 100 U.S.\$/barrel crude oil price by 2015 and the large biofuel mandates in the U.S. will all contribute to new higher price plateau over the medium term compared to the period before 2006. The highest plateau will be recorded for vegetable oil, sugar and oilseeds.
- Because of the high feed cost the trough of the current U.S. hog price cycle will not be as low as the previous one. The next peak should be reached in 2010 and 2011. The hog-corn price ratio should improve over the medium term compared to 2008 and 2009 but will not return to levels prevailing before the large increase in crop prices. This will also be the case for the steer-corn ratio since farmers will be able to mitigate part of the cost increase by changing feeding practices (more short keep) and by using more distiller's dried grains (DDG). The next trough in the U.S. cattle price cycle should be in 2011/12. U.S. poultry and eggs prices should adjust the most rapidly to the higher cost since feed counts for the largest proportion of variable cost and the production cycle is the shortest.
- After a large decline in 2009 resulting mostly from the macro economic downturn, world prices of dairy products are expected to increase over the medium term because of strong demand, production constraints in Oceania, higher cost of production and lower subsidized exports. At the end of the outlook period prices should be lower than in 2008 but significantly higher than at the beginning of the century.

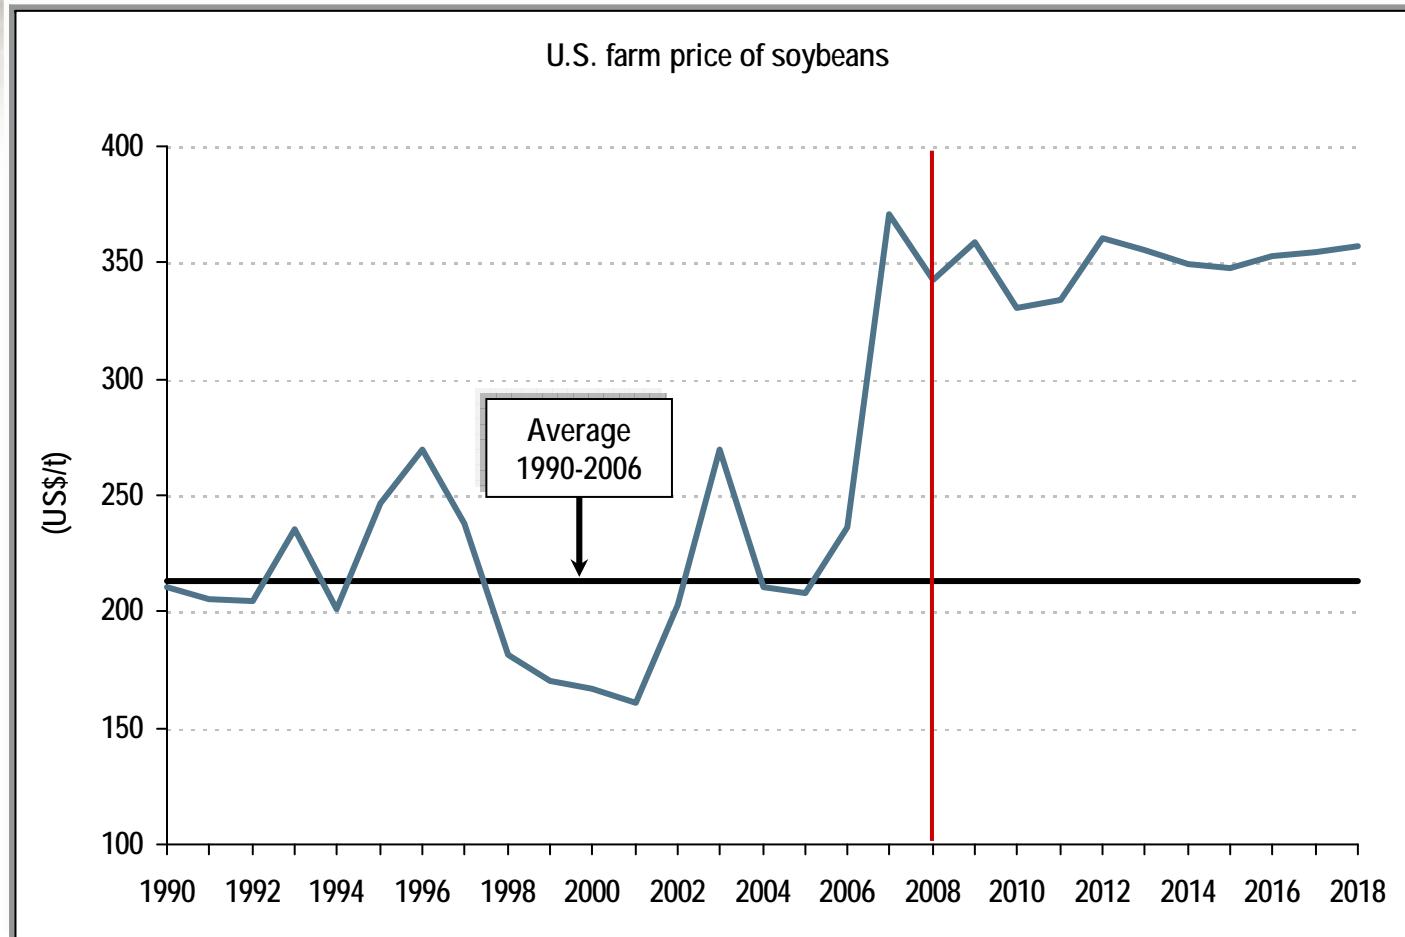

*Stronger demand for corn is expected to lead to a new higher world price plateau*

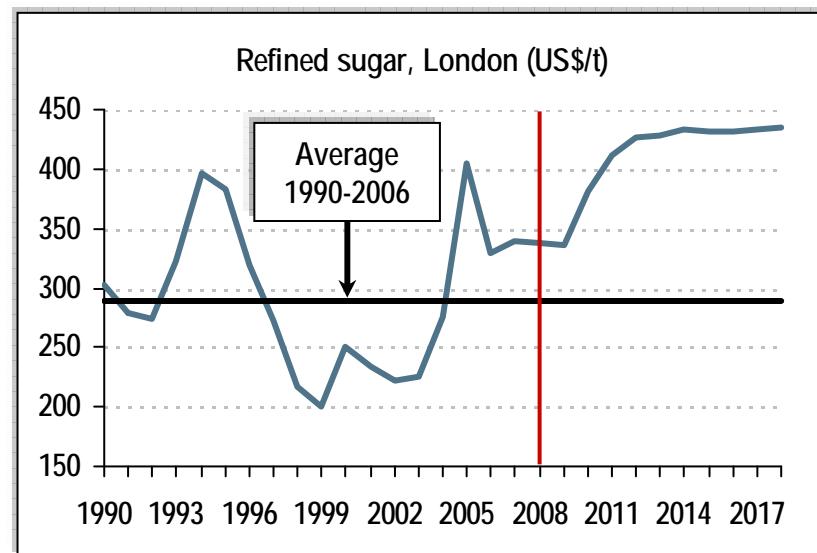

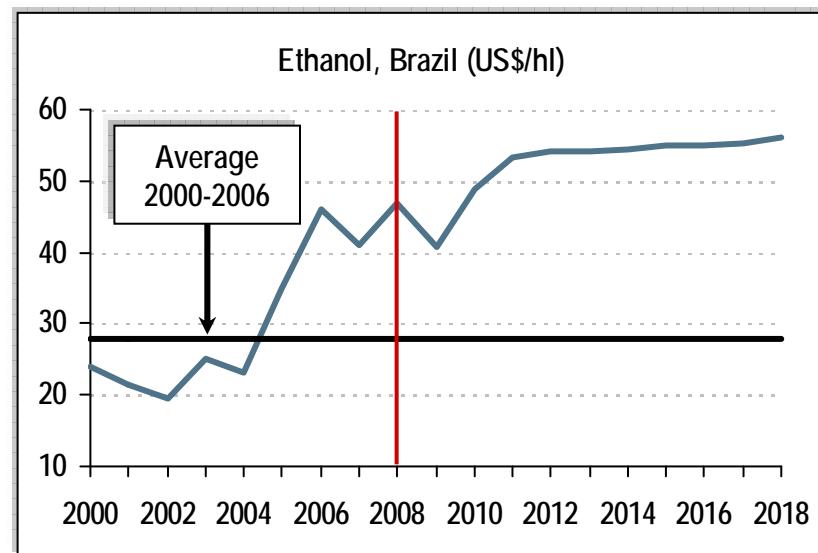

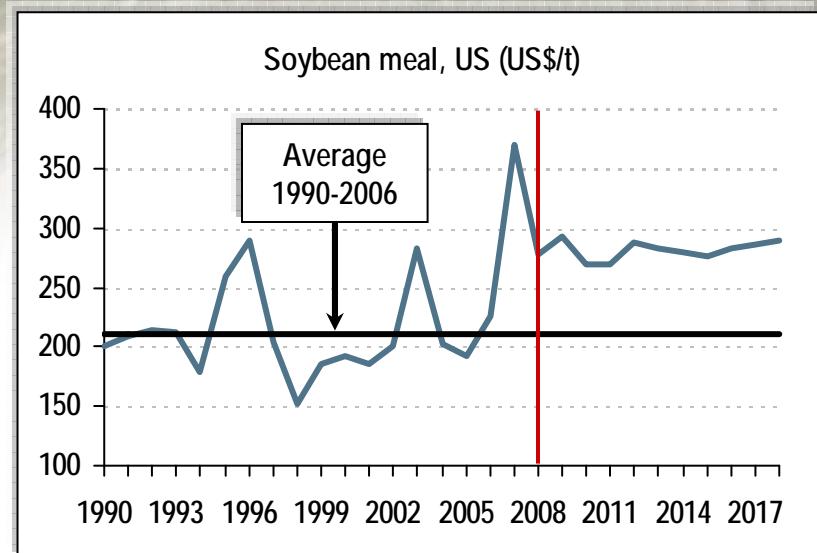

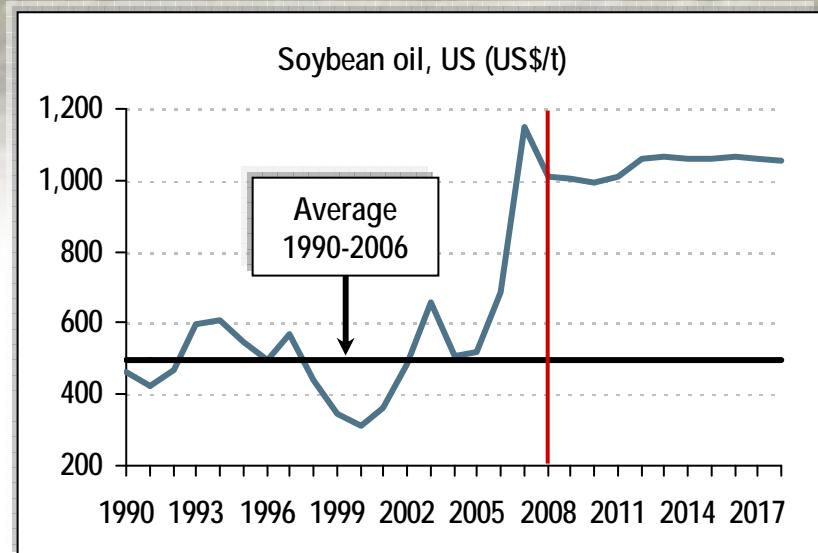

*Wheat prices should also reach a new plateau partly because of the substitution with coarse grains on the feed demand and supply side*

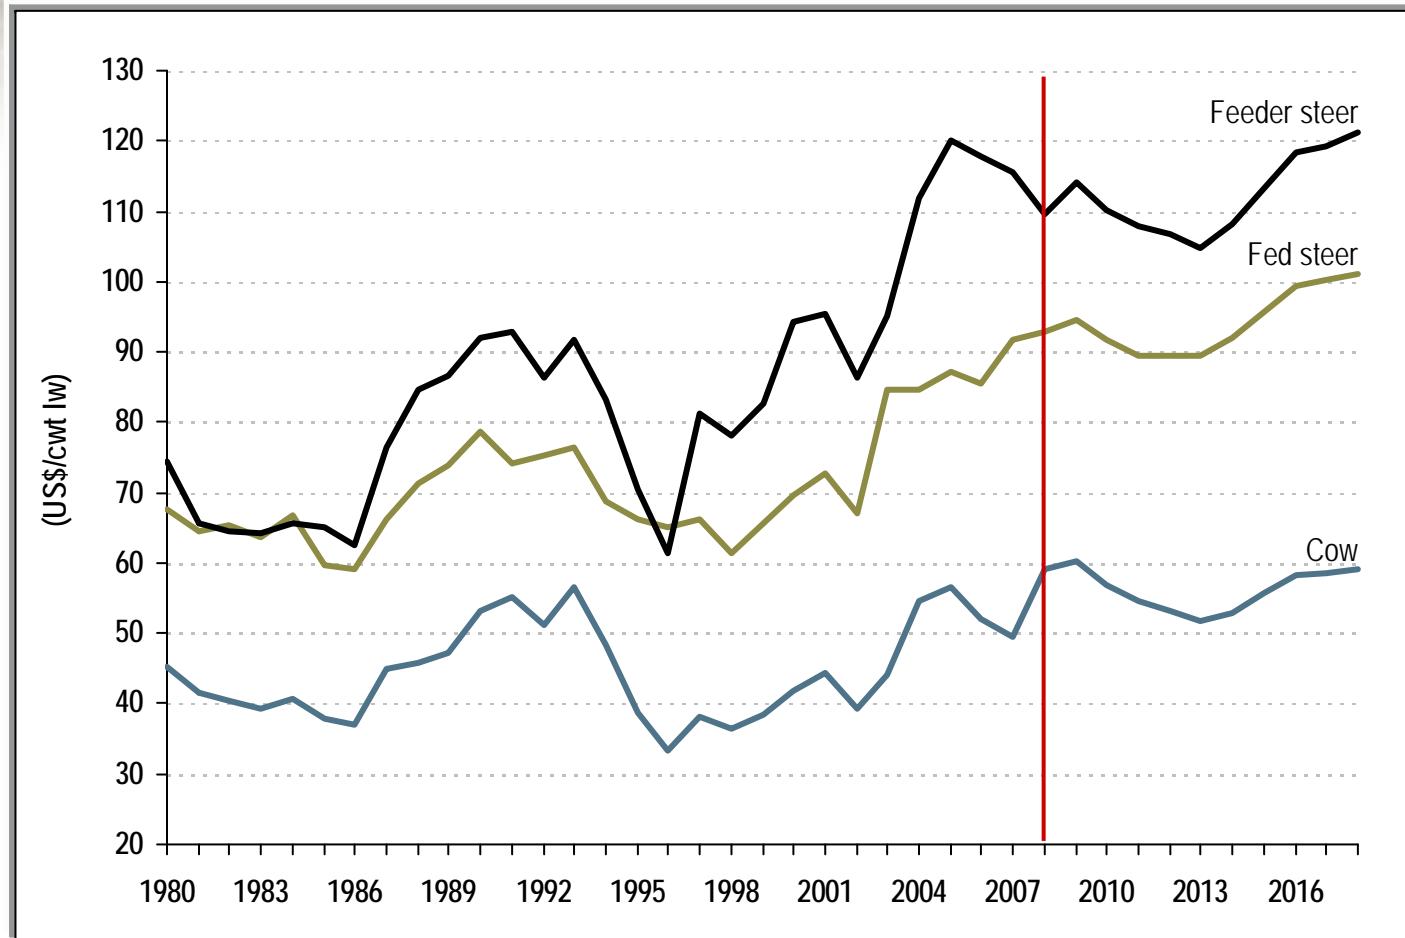

*The growing demand for vegetable oils and the strong substitution on the supply side with corn should result in higher soybean prices*

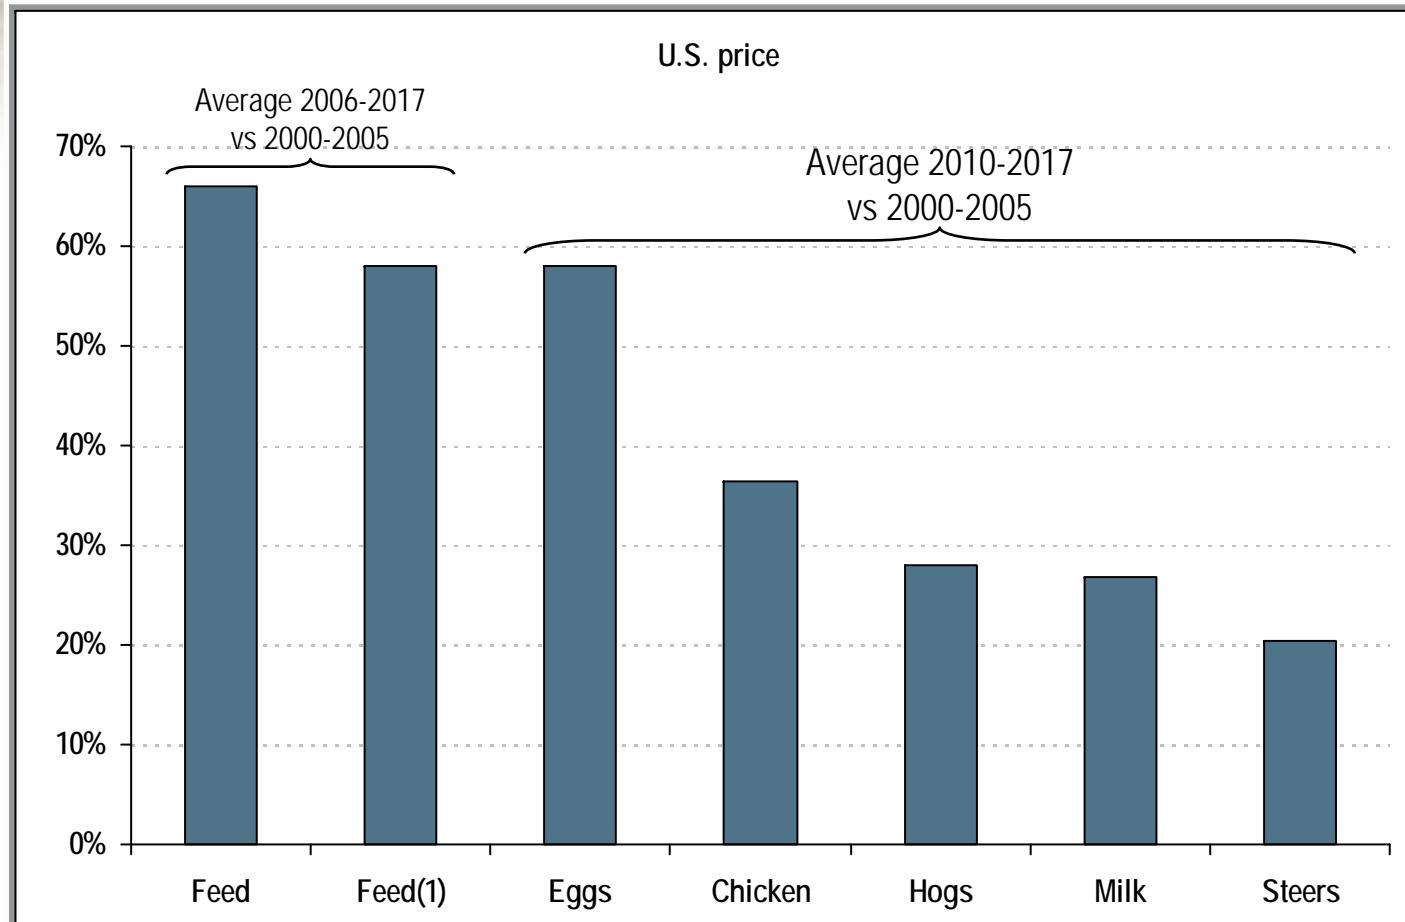

*New higher world price plateau are also expected for further processed products*

*The rise in the steer/corn price ratio will be delayed by the economic recession and the relationship between the feeder and the feed steer prices is affected by the DDG*

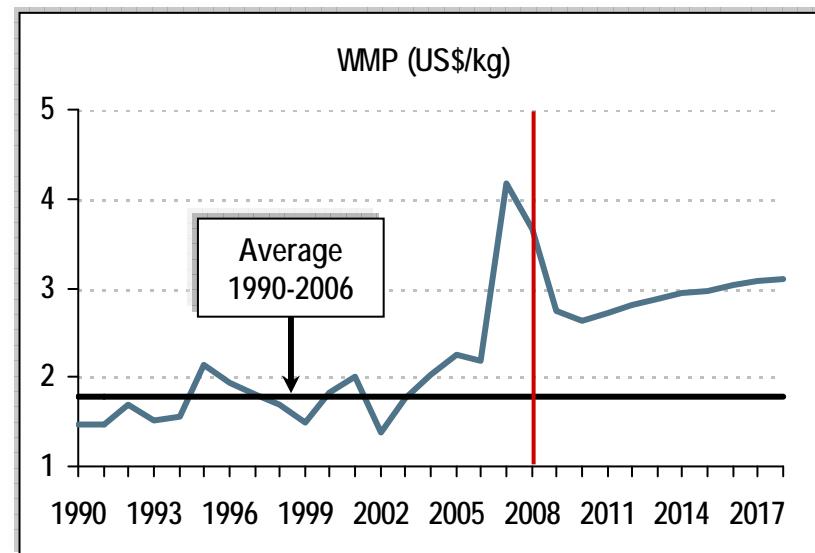

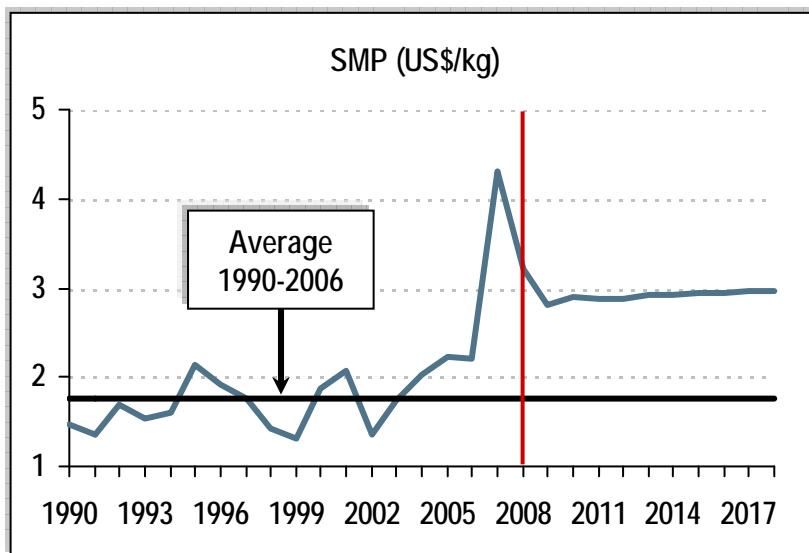

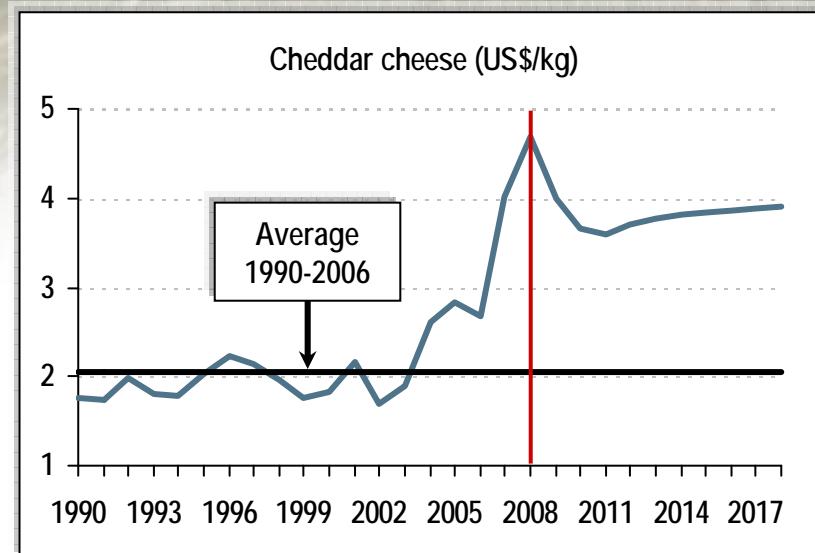

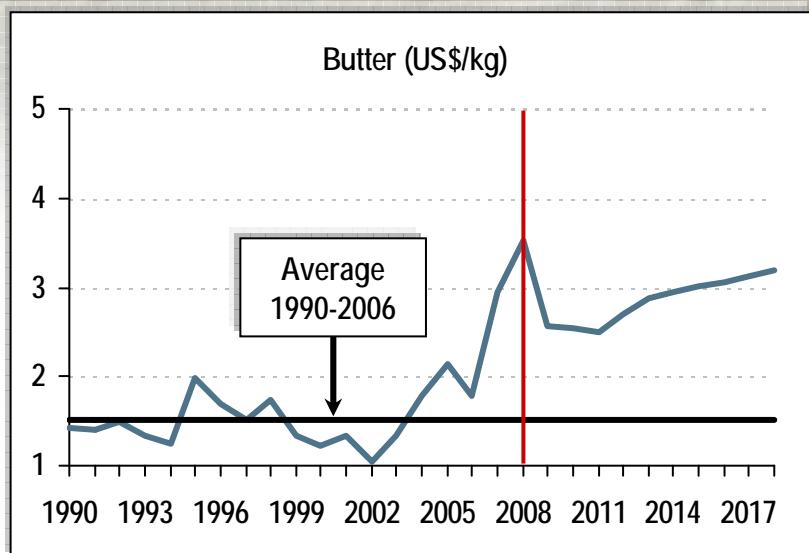

*Livestock prices are expected to increase eventually as a result of increasing production cost caused by the higher feed prices*

(1) Feed with DDG.

*Strong demand, supply constraints in Oceania, higher cost of production and lower subsidized exports are projected to result in new higher world price plateau for dairy products*

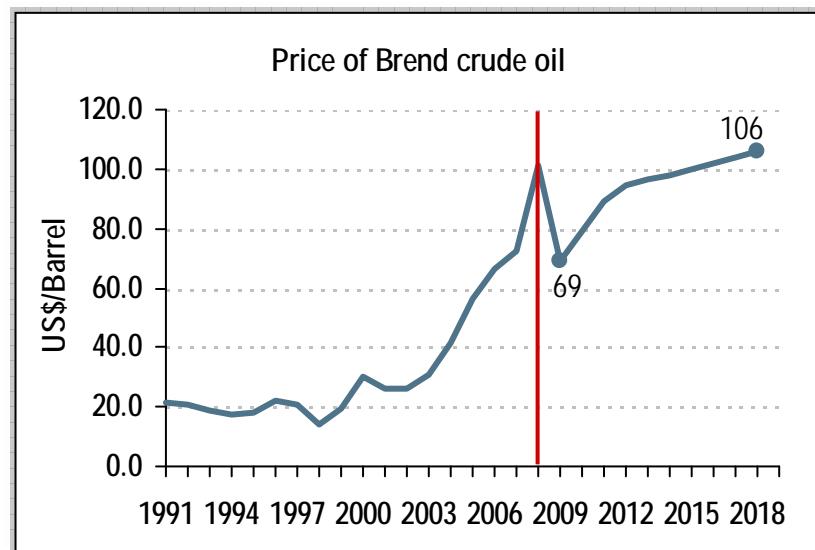

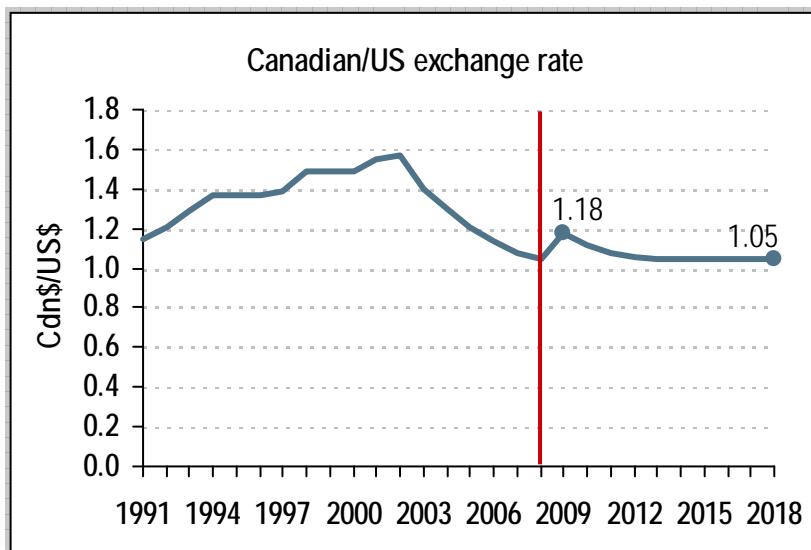

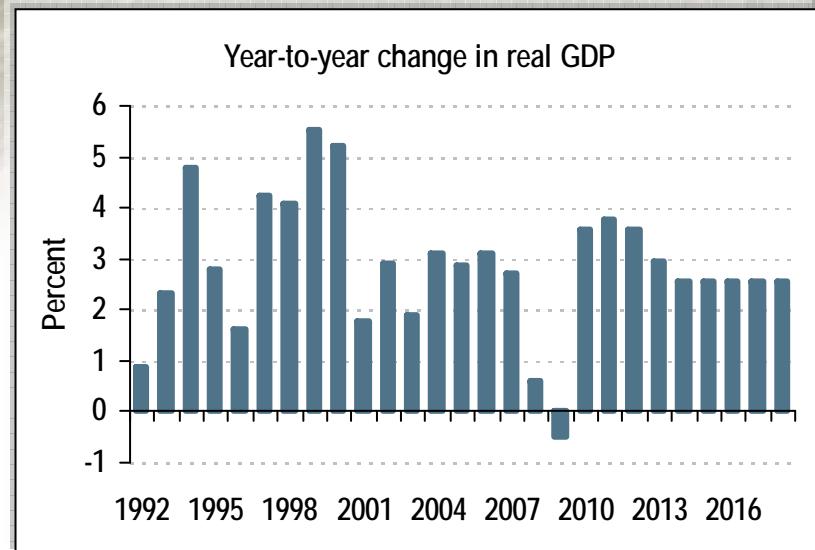

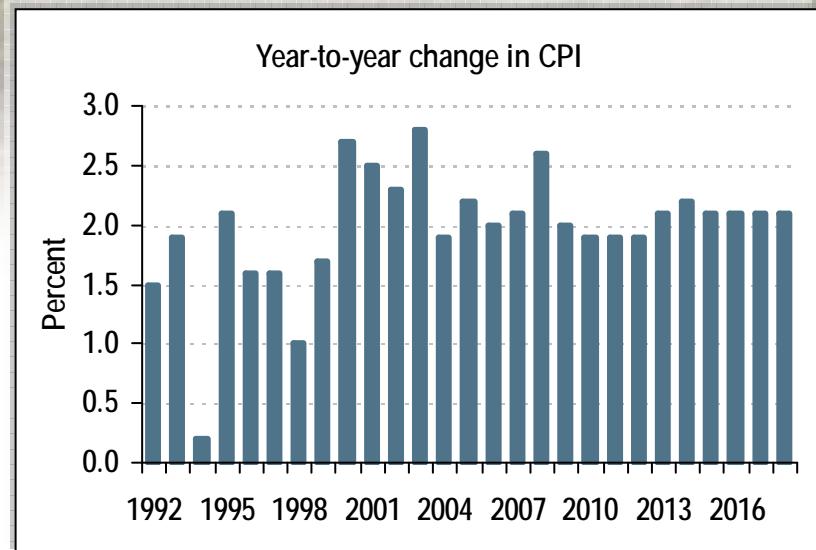

## NATIONAL MARKETS

## National assumptions: Macroeconomic Outlook

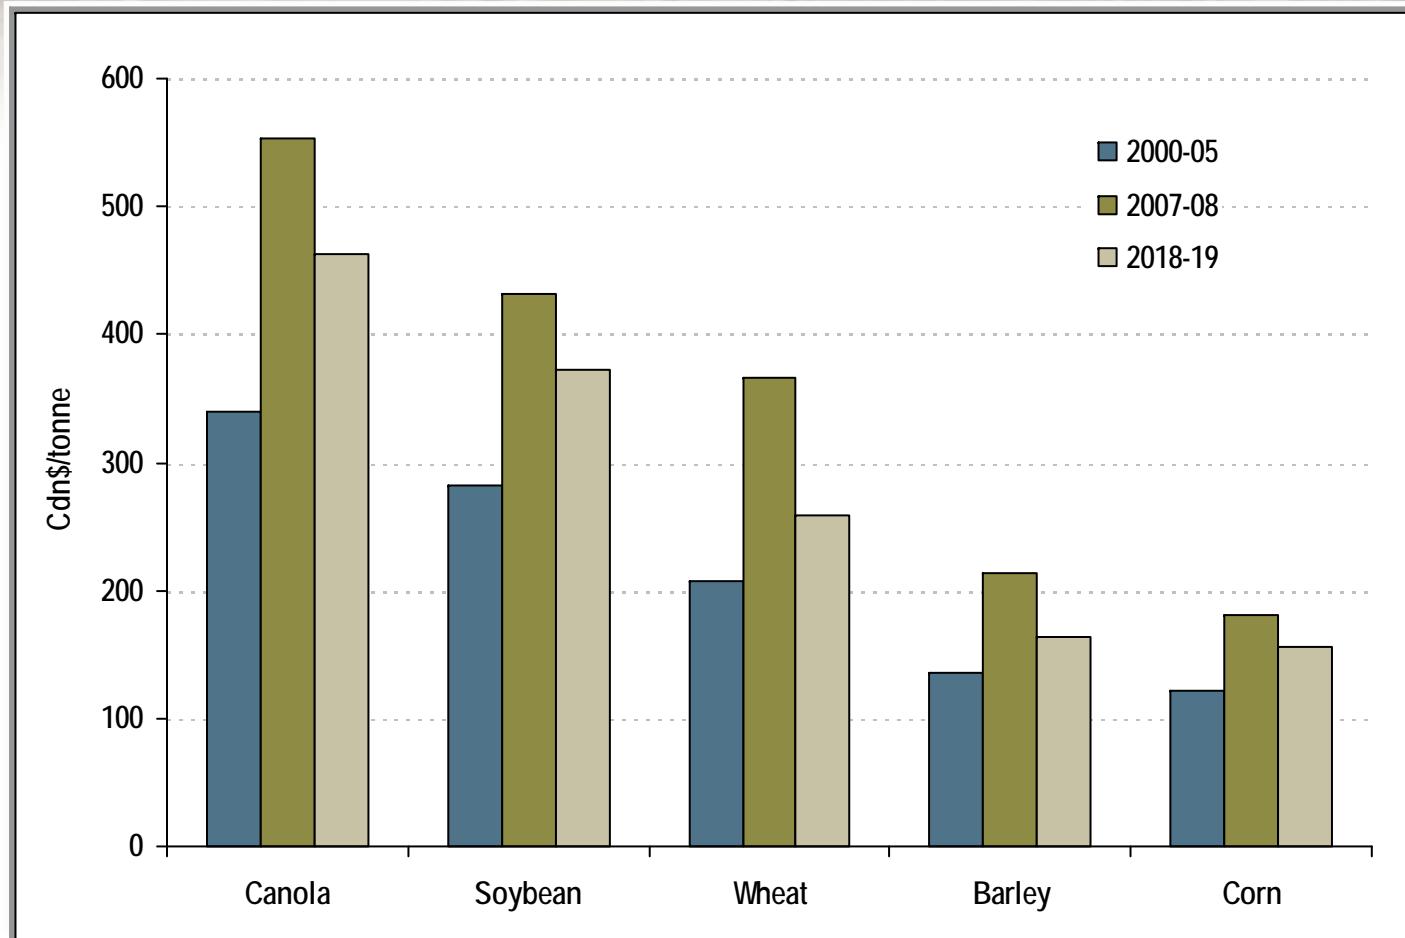

## *National assumptions*

- The Canadian population is projected to increase by 1% per year.
- The single car grain transportation rate is projected to increase at half the rate of inflation as efficiencies gained under the revenue cap partially off-set rising costs. Grain elevation rates are assumed to increase in line with the rate of inflation.
- Grains and oilseeds yield are generally expected to increase at trend rates.
- It is assumed that the Federal regulations requiring an annual average renewable content of 5% in gasoline by 2010 and 2% in diesel fuel and heating oil by 2012 will be implemented.
- Ethanol plants that have planned to start production in 2007/2008 and 2008/2009 are assumed to produce at full capacity. The by-product of ethanol production, distiller's dried grains (DDG), are assumed to be easily incorporated in feed rations.
- Exports to the U.S. of cattle and beef from cattle over thirty months (OTM) of age resume in 2008.
- The moratorium on hog production in Manitoba is maintained over the entire outlook period and the post mortem weanling syndrome (PMWS) does not re-appear. The budget of the cull breeding swine program will be fully used.
- The industrial milk price is expected to grow modestly with most of the increase coming from the milk fat price.
- The fat/solids-not-fat ratio for raw milk should be relatively stable as measures implemented by producers are maintained.

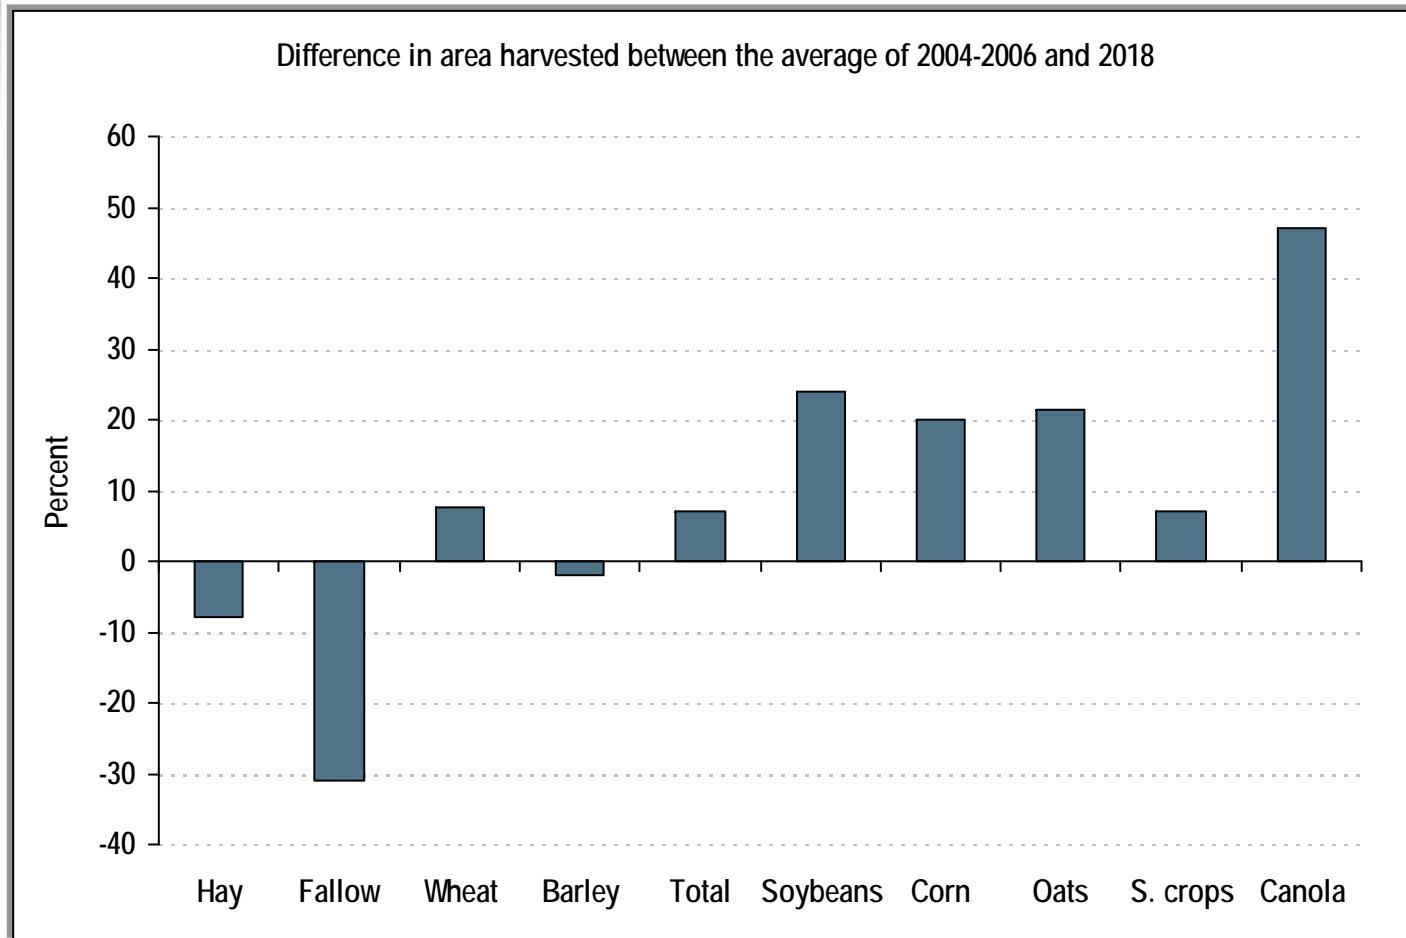

## *Highlights: crops*

- The key drivers of the Canadian outlook are world prices, the exchange rate, the expansion of bio-fuel production and the contraction of the red meat industry.
- The depreciation of the Canadian dollar will not entirely compensate for the decline in the world prices of grains and oilseeds in the short term and as a result, prices in Canada of most of these commodities are expected to fall significantly in 2008-09.
- For the medium term, prices of grains, oilseeds and special crops are projected to be significantly higher than the period before 2006 in spite of the anticipated appreciation of the Canadian dollar, but below the high levels of 2007. In response, total harvested area is projected to increase compared to the historical average (2004-2006). The largest increase should be recorded for oilseeds followed by coarse grains, while hay and summer fallow area are expected to decline.
- The reduction in feed demand resulting from the contraction of the red meat industry and the use of DDG combine with the larger production will lead to higher export of wheat and a return to a net export position for the main feed grains (corn and barley) by 2013 in spite of a larger use of wheat and corn by the biofuel industry. Corn and barley prices will therefore not be determined on a full import basis anymore.
- For Canada to meet its target, biofuel imports will have to increase in spite of a rapid and large expansion in production. Ethanol production in Western Canada is derived from wheat and corn, while Eastern Canada uses solely corn as feedstock.
- Canola crushing capacity is expected to expand, but strong production growth still leads to increasing exports of canola as of 2012. The larger use of canola oil for biodiesel production remains much smaller than the growth in production leading to a strong increase in canola oil exports.

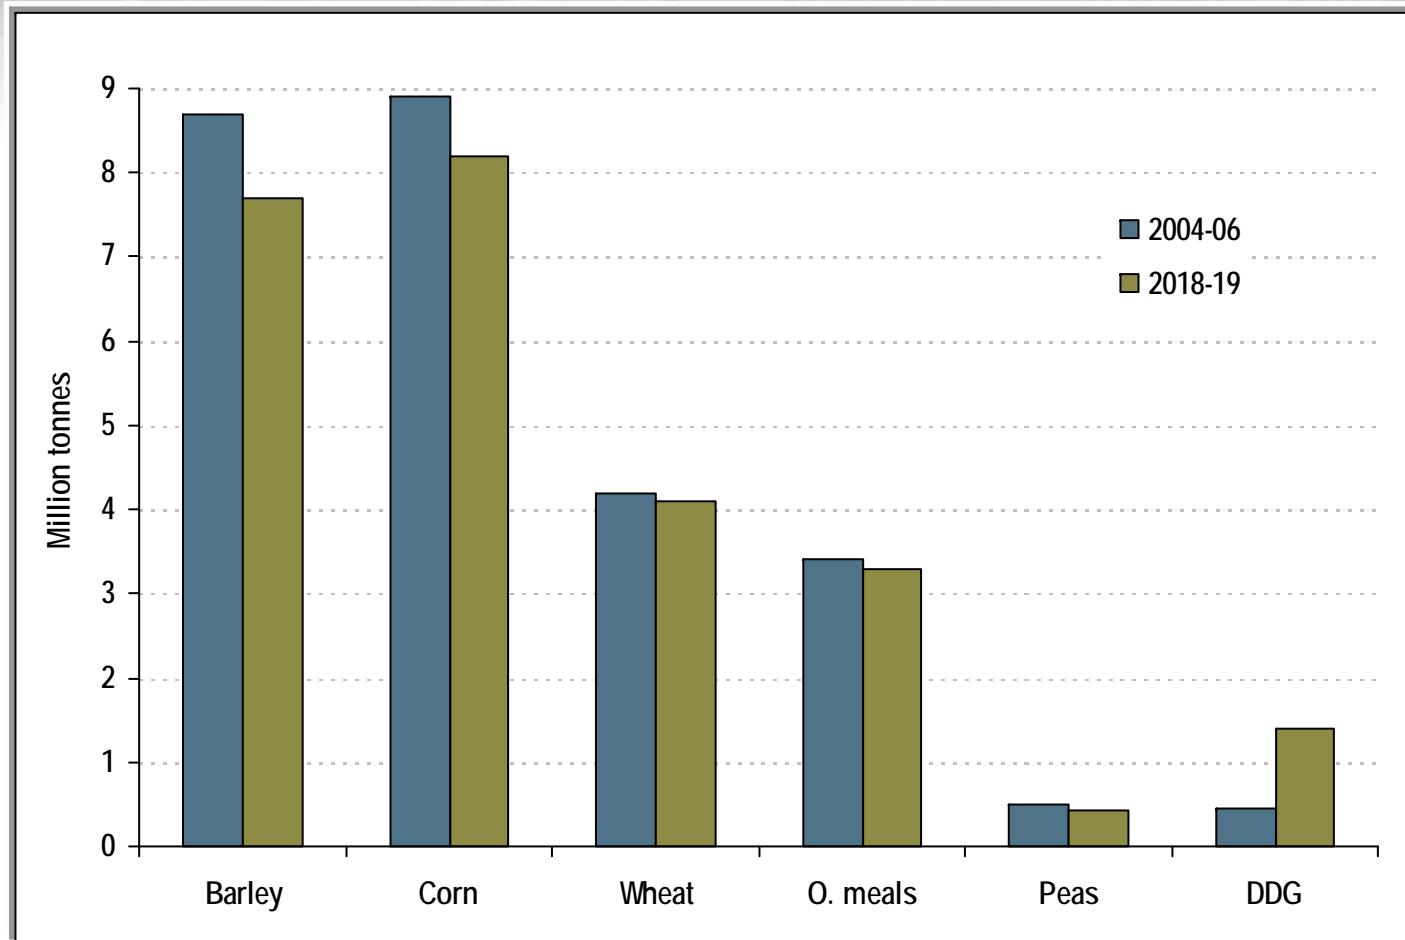

*Canadian prices in the medium term will be lower than the latest record highs but substantially higher than at the beginning of the century*

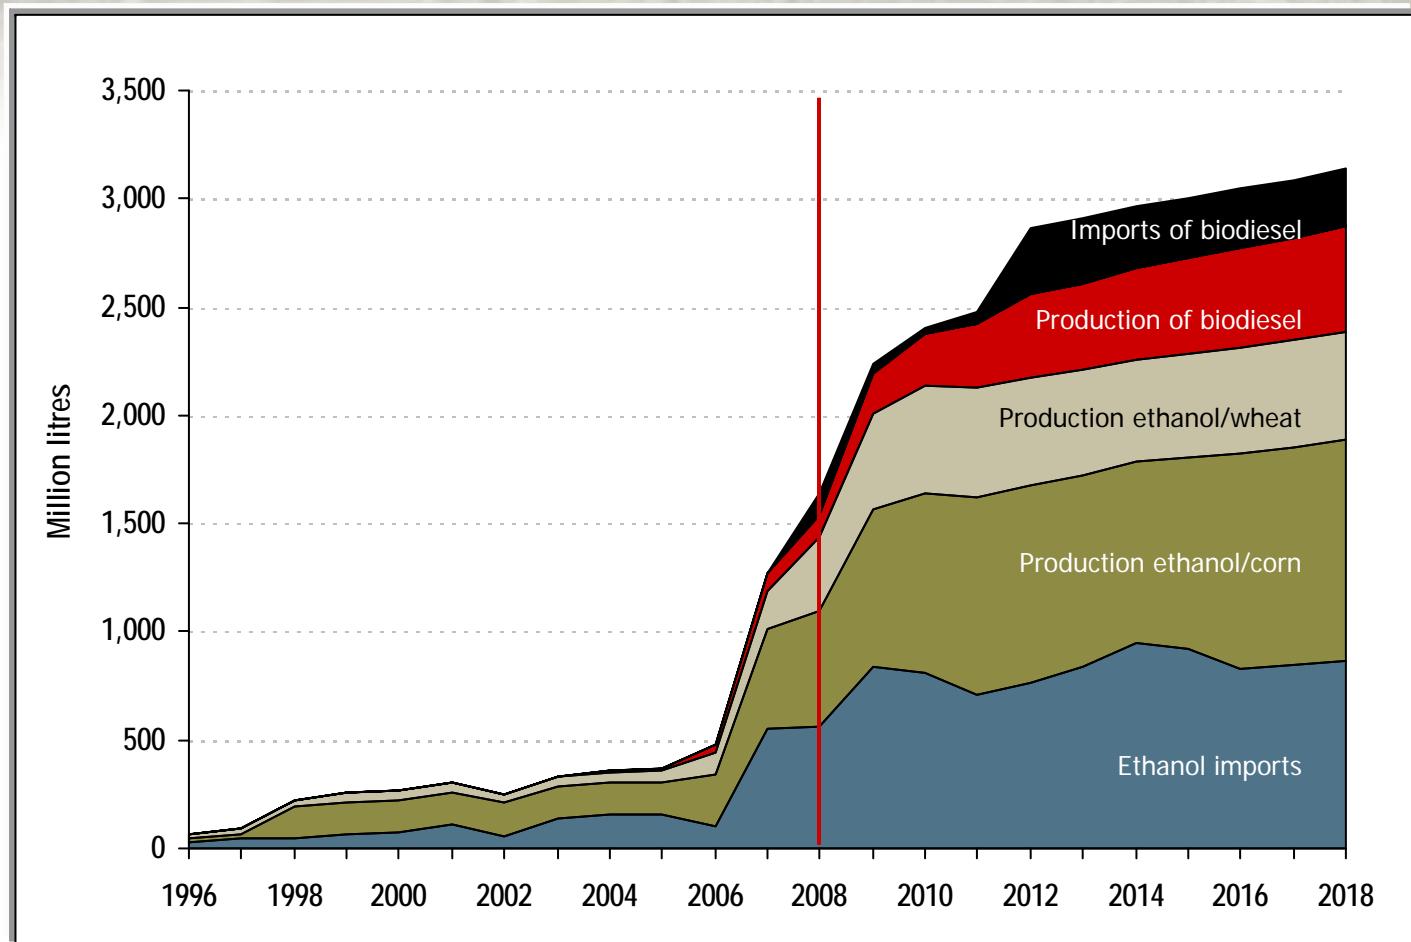

*Higher grain and oilseed prices are expected to result in a modest expansion in total area in Canada and relative prices should lead to large increases in canola, corn, soybeans and oats area*

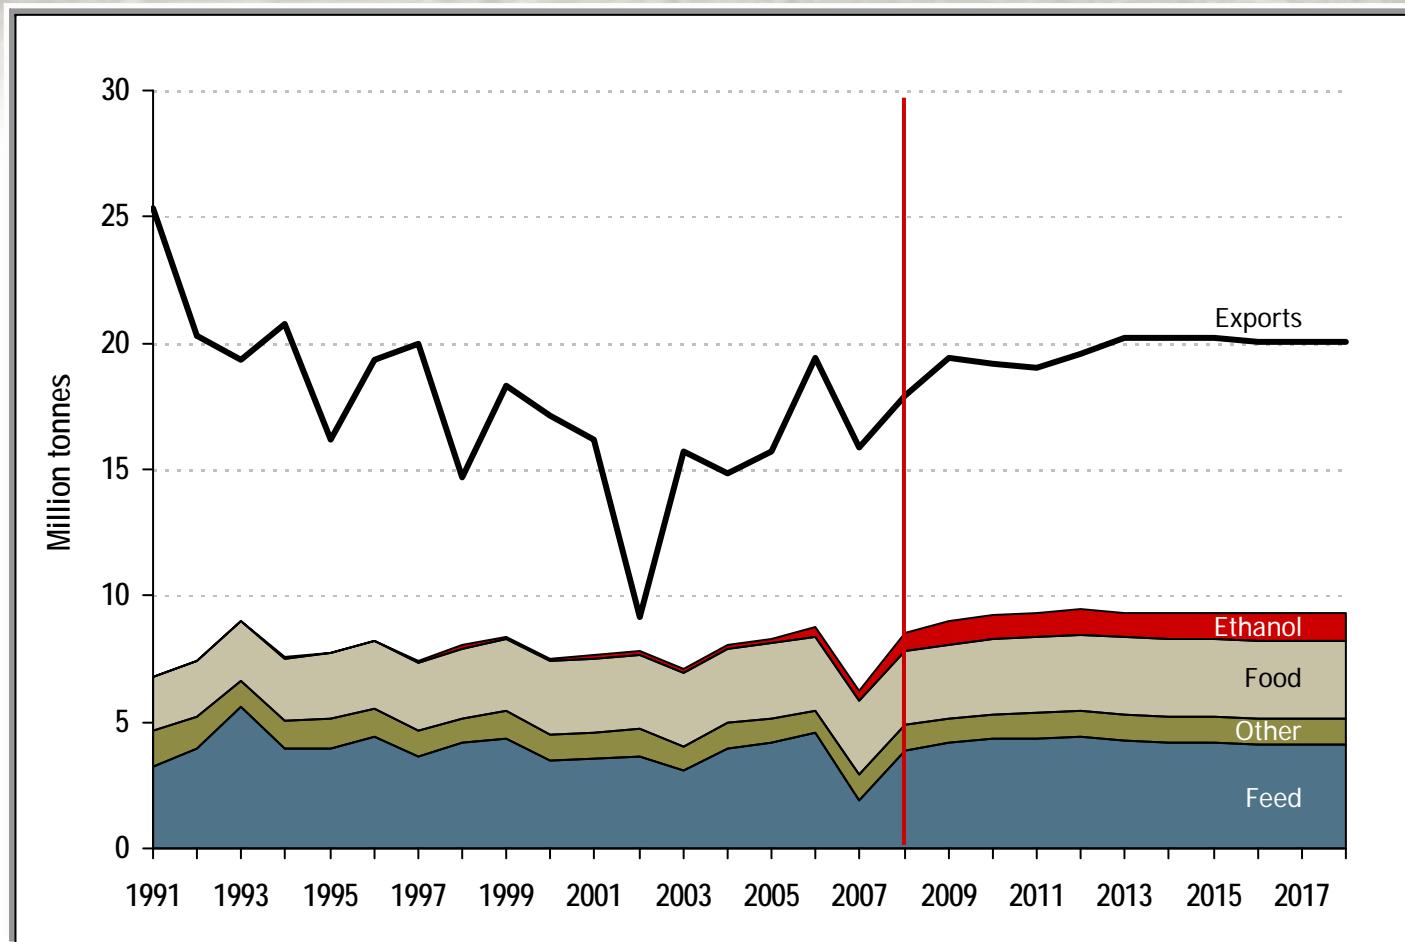

*Continued improvement in feed conversion, lower livestock numbers and greater use of DDG reduce coarse grains feed demand*

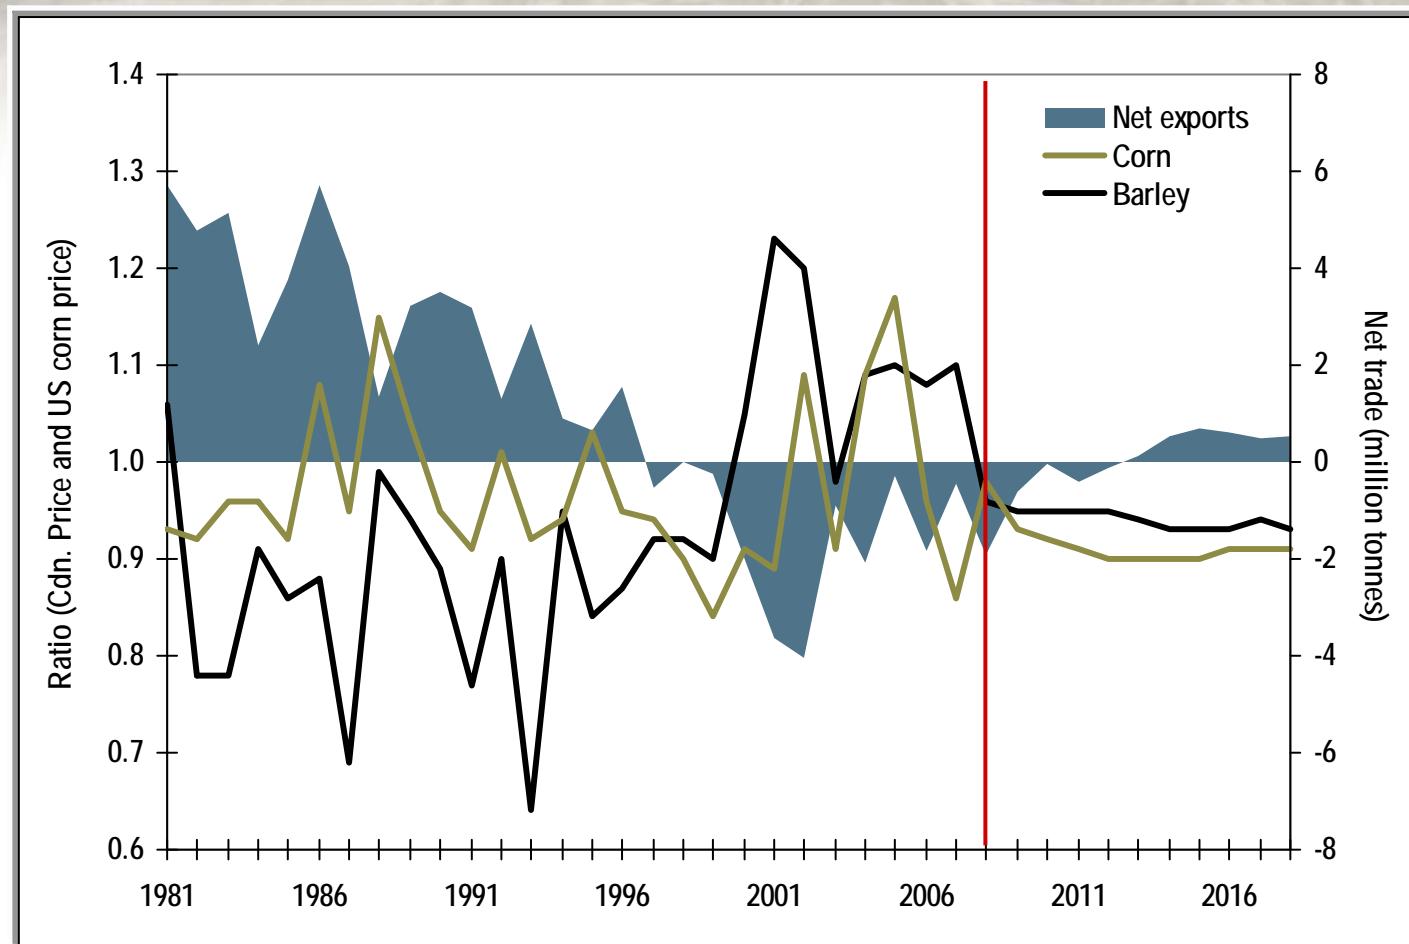

*For Canada to meet its target, biofuel imports will have to increase in spite of a rapid and large expansion in production*

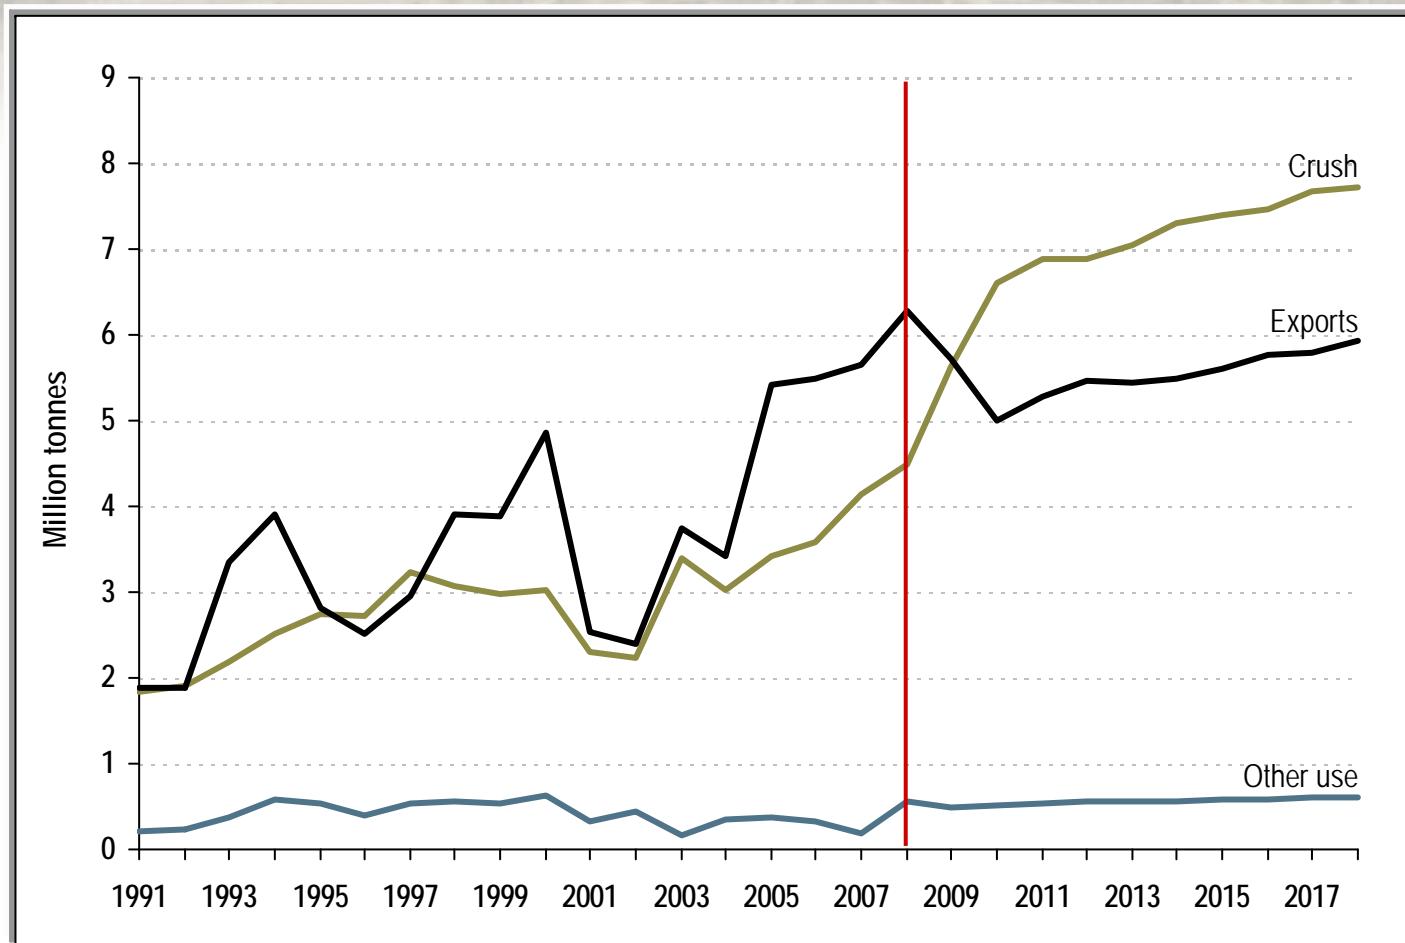

*Wheat production is expected to increase sufficiently to allow larger exports in spite of growing demand from the biofuel industry*

*Lower feed demand and higher production will lead to a reversal of the trade balance of the main feed grains and prices won't remain at the import ceiling*

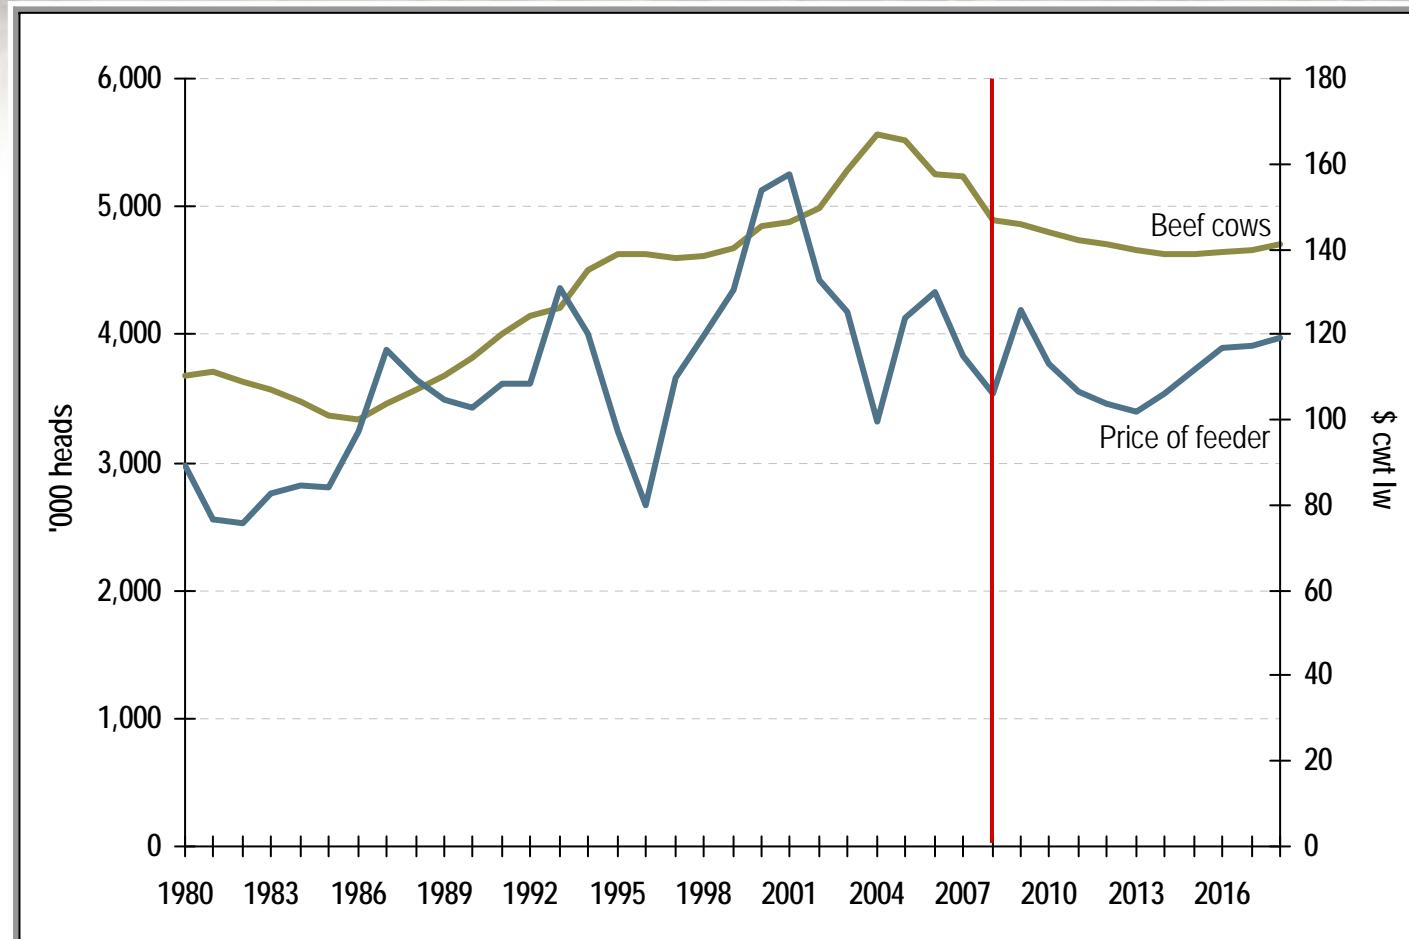

*Canada is expected to respond to the growing world vegetable oil demand by crushing more canola domestically*

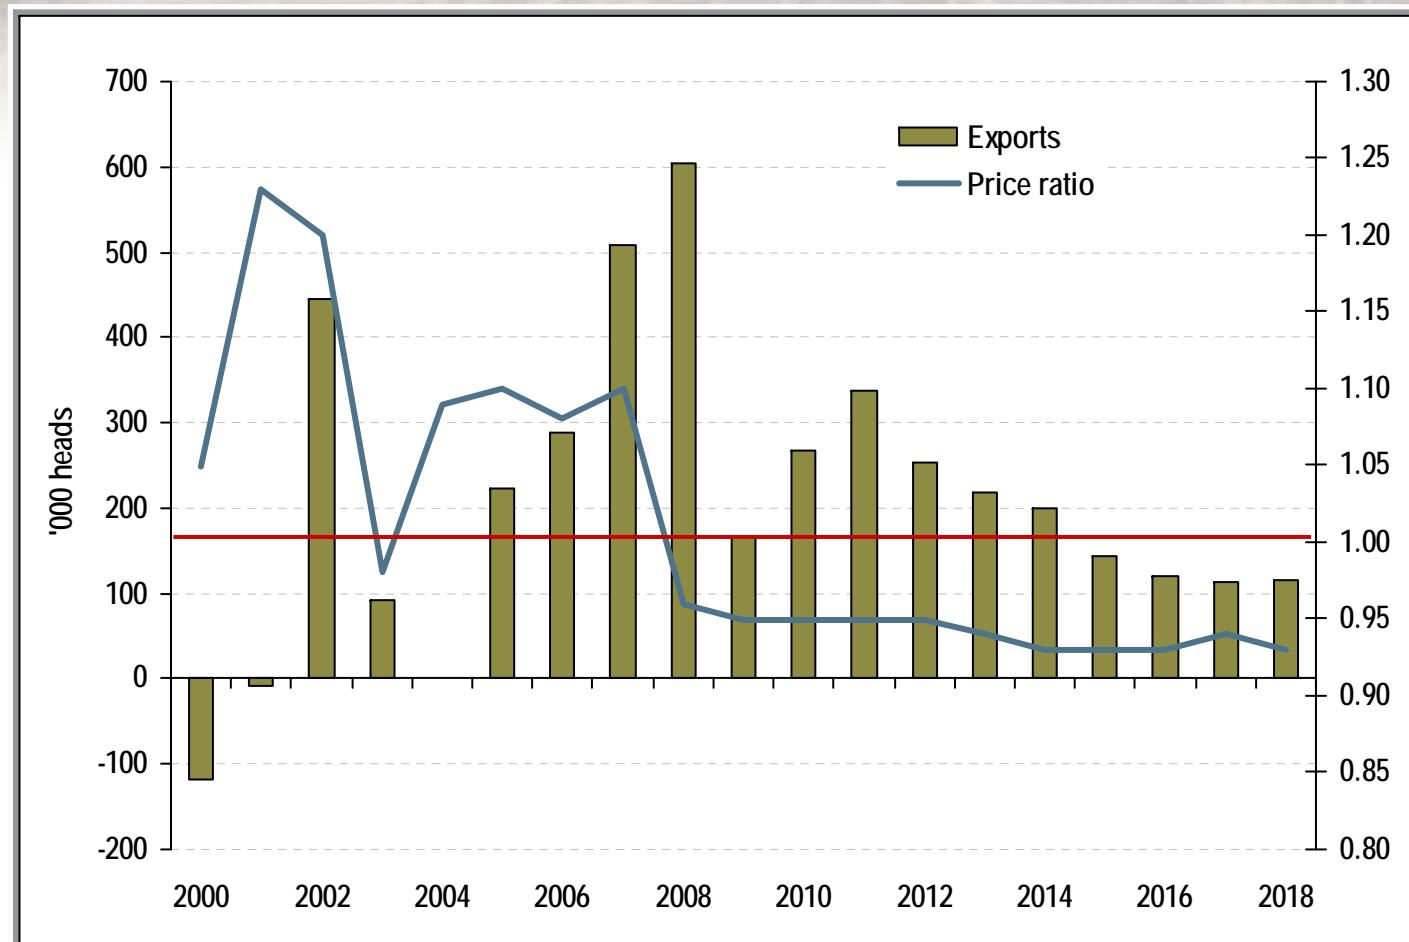

## *Highlights: red meats*

- Relatively high feed grain prices coupled with low prices for hogs and steers and the implementation of COOL in the USA create challenges for the red meat sectors.
- The ability to export OTM cattle, the high price of grain and oilseeds relative to the price of feeder cattle and a strong dollar in the medium term are all contributing to a contraction of the breeding herd until 2015. The growth in the last 3 years of the outlook will not prevent an overall decline of 10% between 2007 and 2018. With a smaller breeding herd, marketings of slaughter cattle also decrease but by only 5% since exports of feeder cattle are expected to be much smaller than in 2007. Cattle slaughter increases in the short-term and then stabilizes over the rest of the outlook because wages made relatively high by the anticipated appreciation of the Canadian dollar still adversely affect slaughter margins. With lower marketings and higher slaughter, exports of slaughter cattle decrease and are substantially lower than historical levels.
- The cull breeding swine program and tight margins are expected to lower the herd of breeding sows. Slaughter hog marketings will follow a cycle but from a lower base resulting from the smaller breeding herd. Hog slaughter remains relatively stable throughout the outlook as low margins prevent expansion. Lower marketings combined with stable slaughter will lead to lower export of slaughter hogs. The moratorium on hog production in Manitoba, COOL and a reversal in the feed grain price basis with the U.S. will all contribute to a reduction in weanling exports.
- The final ruling and the letter sent to the industry by the USA Agriculture Secretary Tom Vilsack regarding COOL were done after the completion of the outlook exercise.

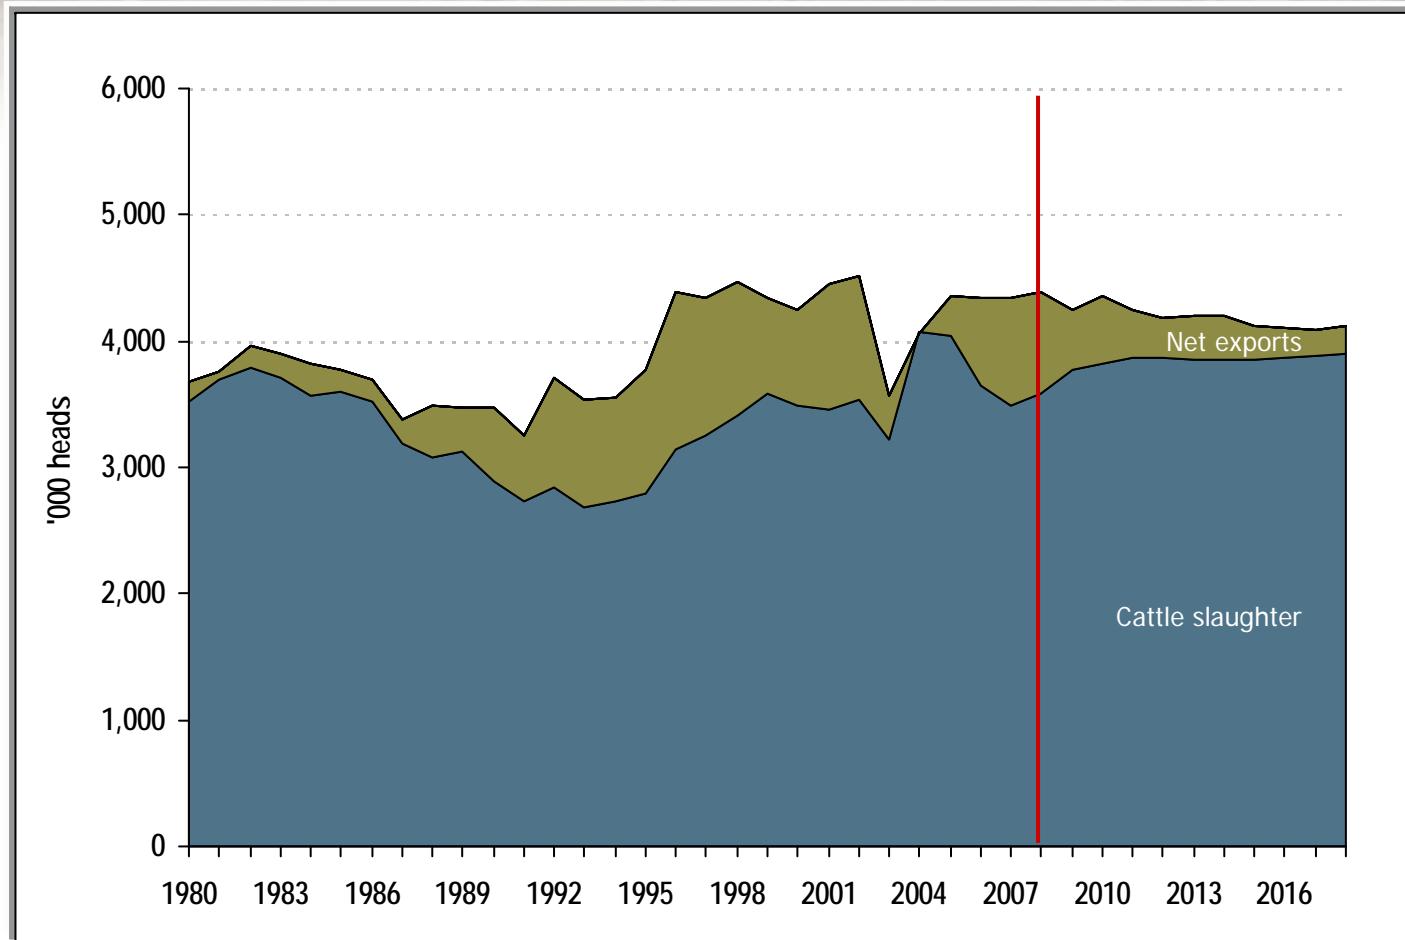

*The ability to export OTM cattle, the high price of grain and oilseeds relative to the price of feeder cattle and a strong dollar in the medium term are all contributing to a contraction of the breeding herd*

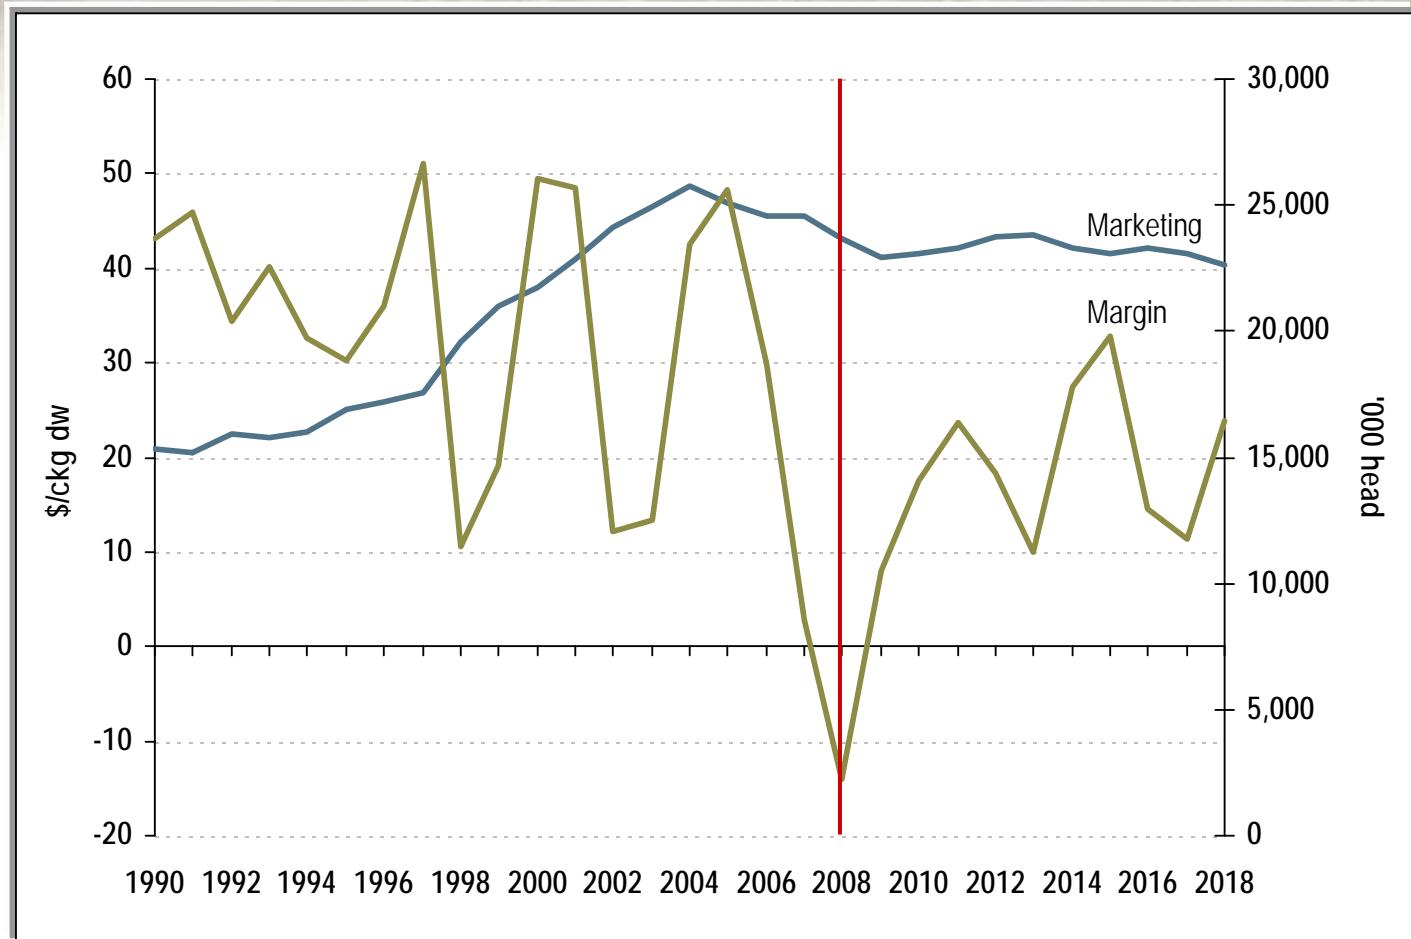

*The reduction in the price of barley relative to the U.S. corn and COOL are leading to a large decline in feeder cattle exports*

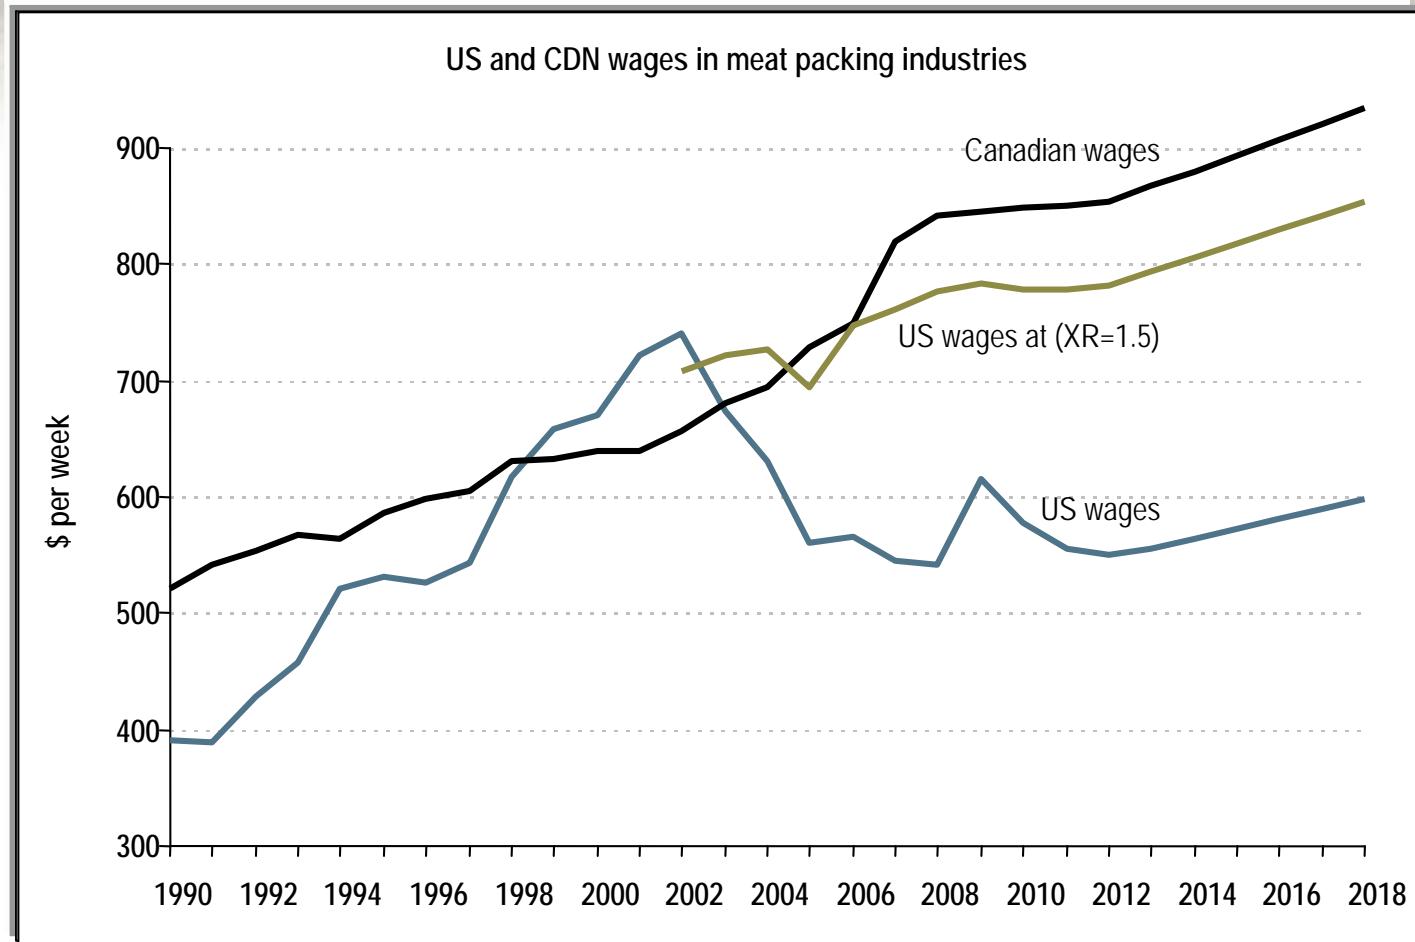

*Slaughter cattle marketing will not fall as much as the breeding herd and will be mostly reflected in lower exports*

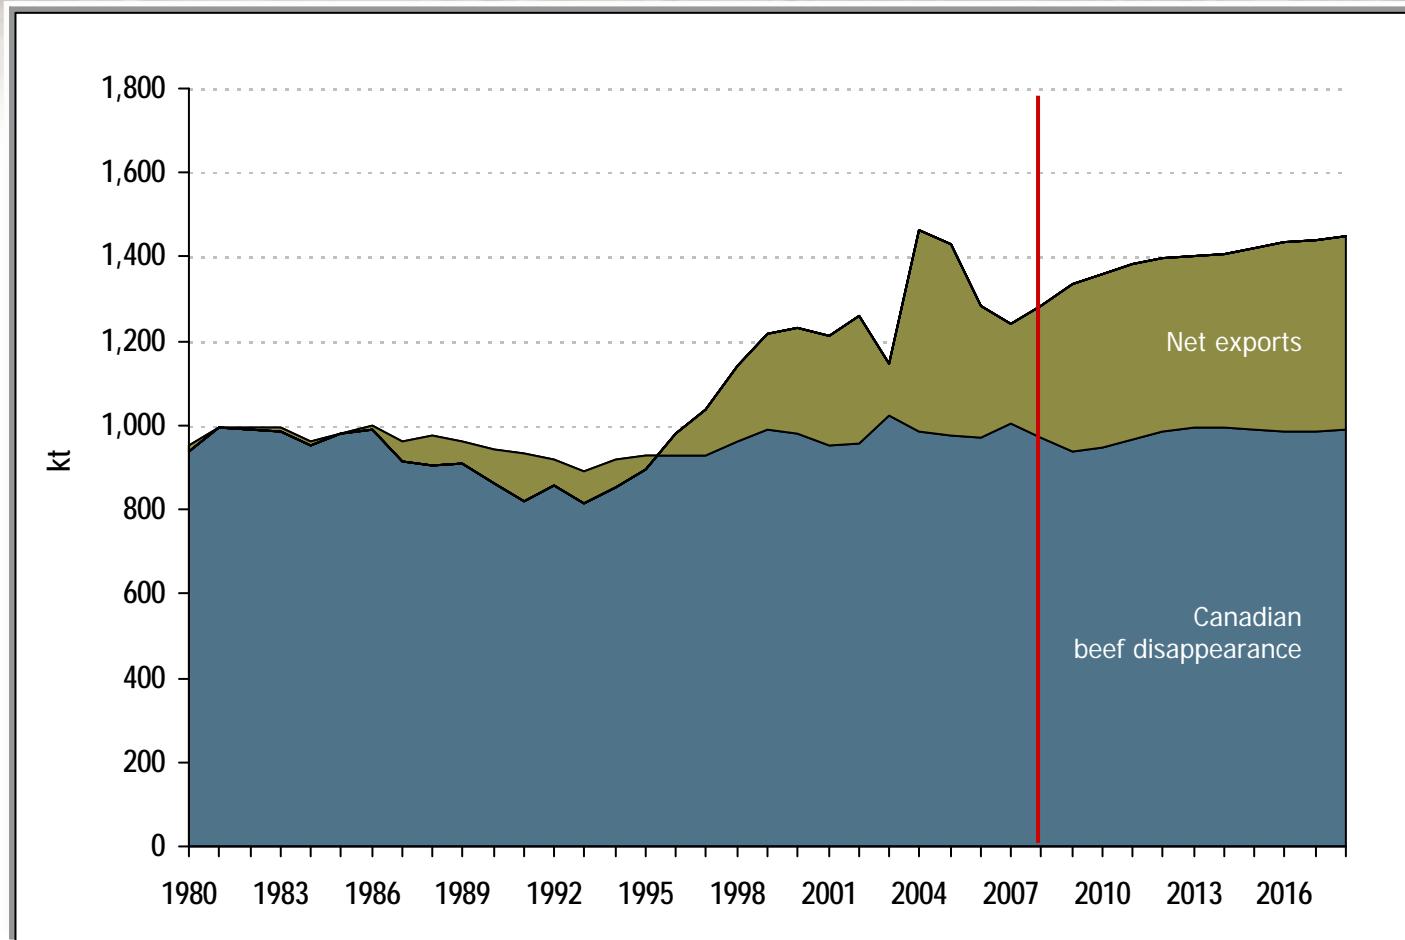

*Hog production margin will continue to be cyclical but from a lower base and this will lead to a contraction in marketing*

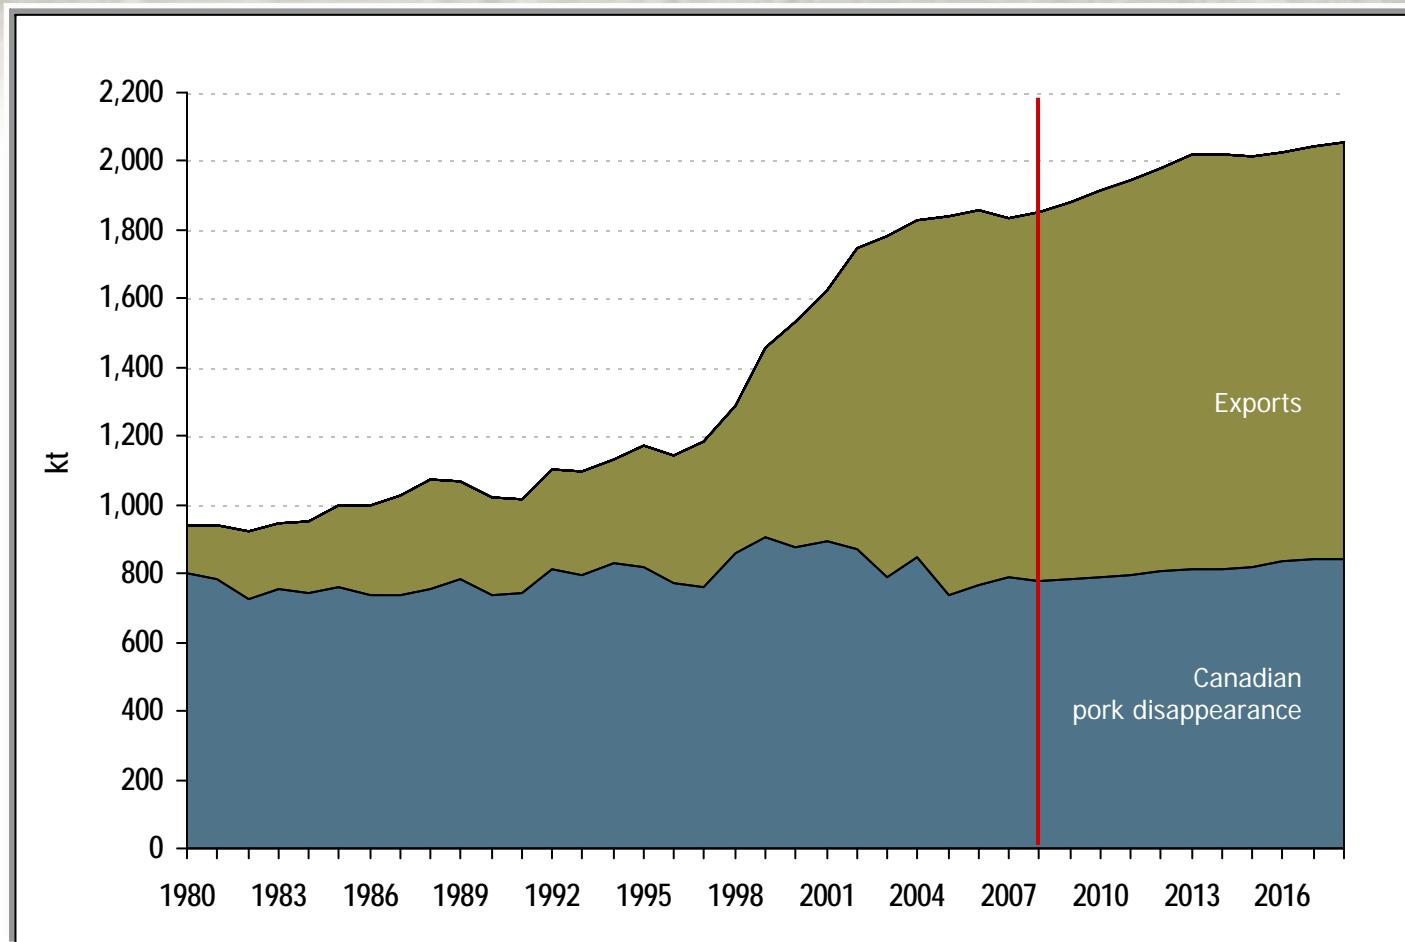

*The loss in the wage advantage because of the stronger dollar will contribute to the reduction in slaughter in the short term and limits capacity expansion in the medium term*

*The additional beef production resulting from the higher average weight of cattle slaughtered will be mostly consumed abroad*

*The additional pork production resulting from the higher average weight of hogs slaughtered will be mostly consumed abroad*

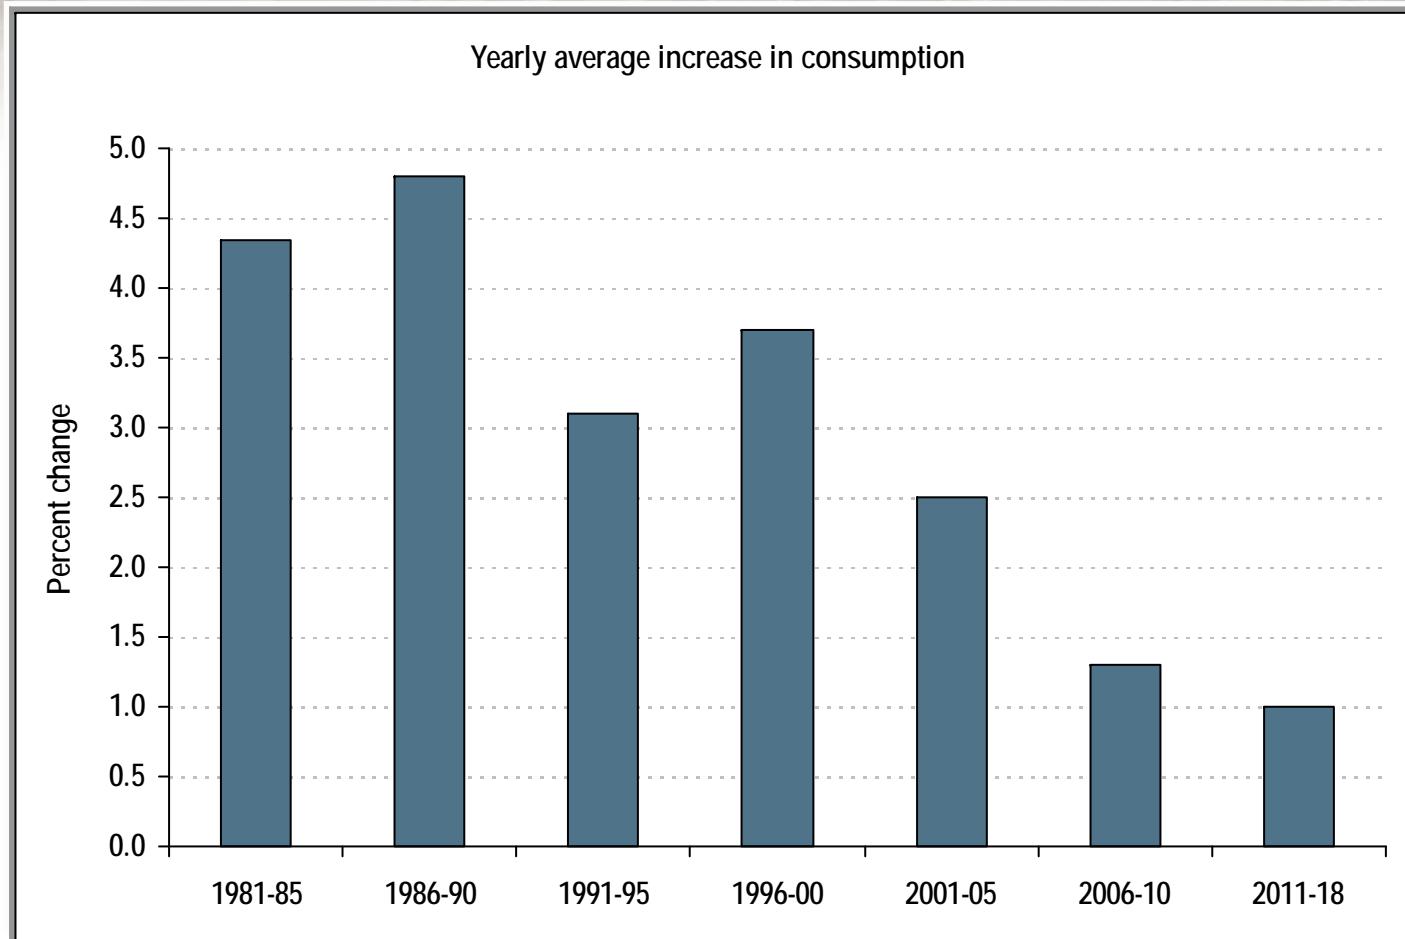

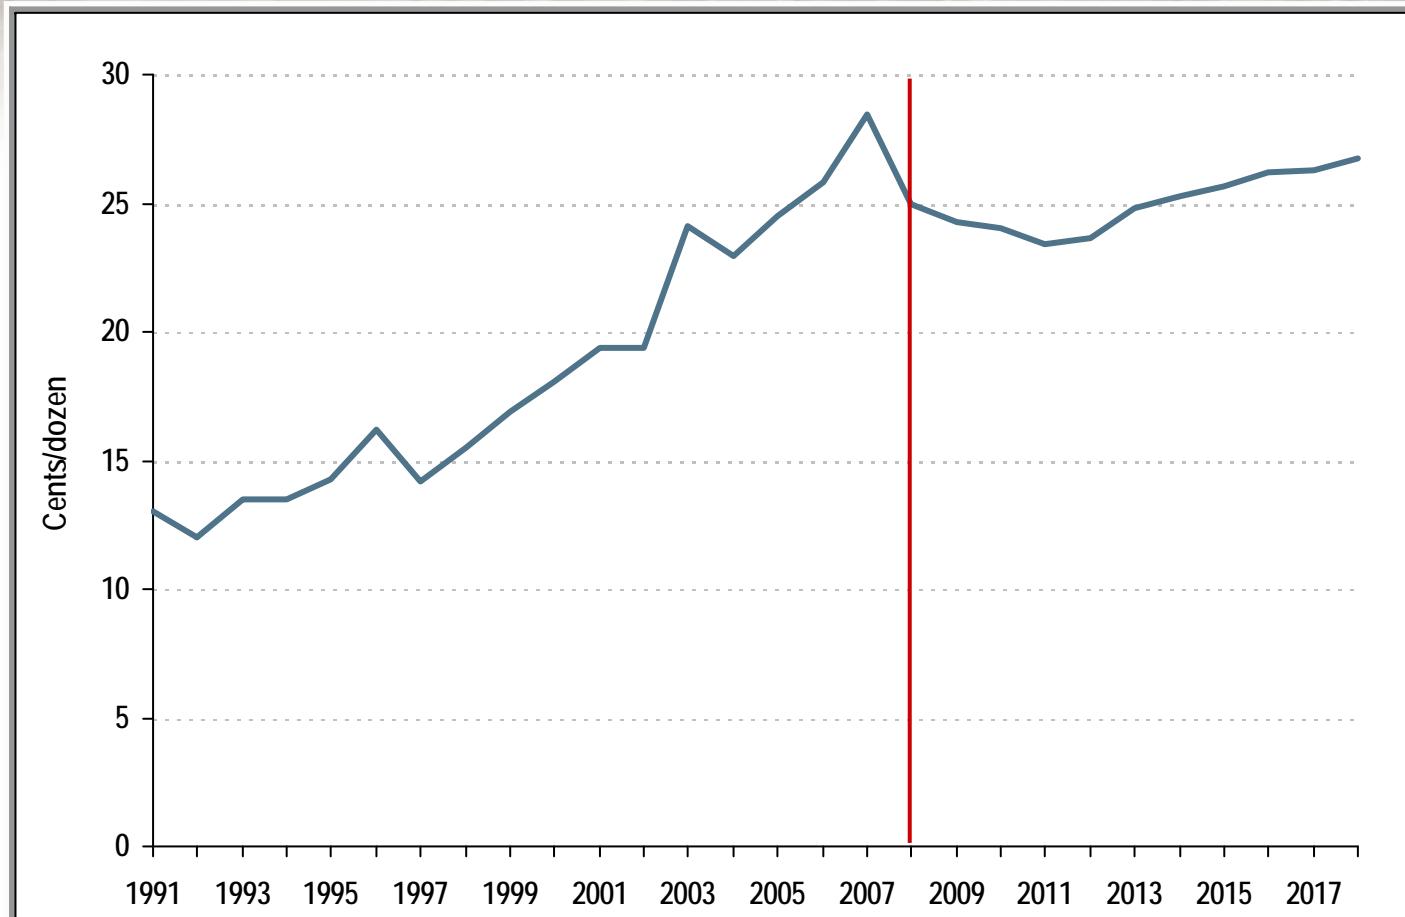

## *Highlights: supply managed commodities*

- Growth in consumption of poultry is expected to be lower than in the past because the market is more mature and poultry prices are expected to increase relative to substitute meats. Per capita consumption of eggs is expected to remain relatively stable. The levy to finance the use of Canadian eggs by the breaker industry should be reduced over the next 3 years since the Canadian price does not increase as much as the U.S. price in the short term. However, the levy should return to its upward trend as of 2012.
- Total milk production for dairy year 2008/09 is expected to be slightly lower compared to the previous year since the additional quota allocation to replenish butter stocks has been removed while the two price adjustments in February and September 2008, which is unusual, are expected to limit growth in consumption. The downward trend in per capita consumption of milk and dairy products resulting from a mature market characterized by a growing aging population is expected to continue but at a slower rate over the outlook period. Consequently, milk production growth is expected to average 0.6% annually and reach 88 mhl in 2018.
- Although world prices have drop significantly recently, no over-quota imports are expected since they are still high relative to the historical period while the Canadian dollar should appreciate moderately over the outlook.
- The skim milk powder (SMP) surplus is expected to remain a deteriorating factor of the milk pool price. Its influence should be somewhat less than in the recent years since future price increases are expected to be applied mostly to butter (2.2% annually). Sales of SMP to the animal feed market are expected to be lower because Canadian authorities have developed new markets for SMP. Finally, exports are projected to remain relatively stable since no major changes in the gap between world and domestic prices are expected.

*Growth in poultry demand is expected to be slower than in the past because the market is more mature and poultry prices are expected to increase relative to substitute meats*

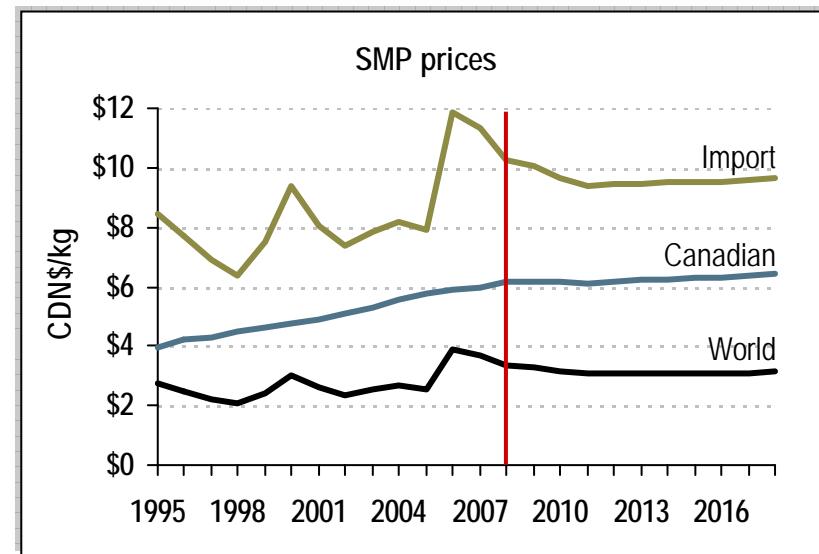

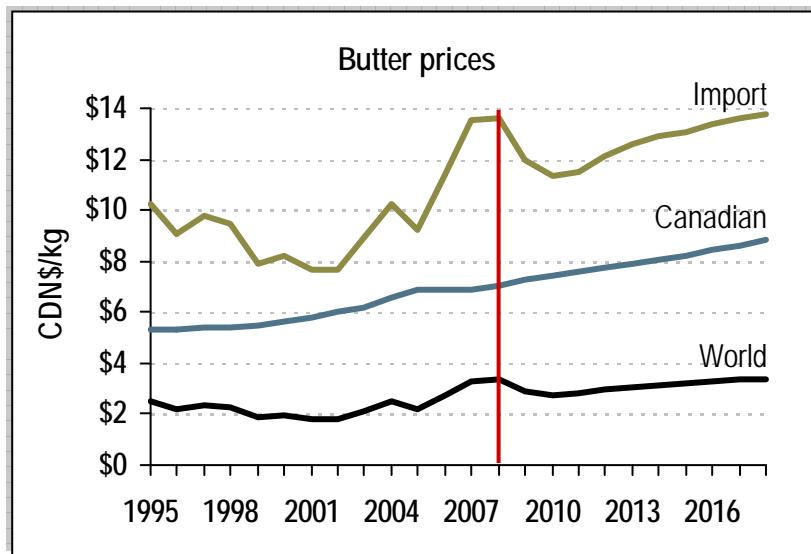

*Because of the large increase in the price of eggs in the U.S. the levy to finance the use of Canadian eggs by the breaker industry should not return to the record level*

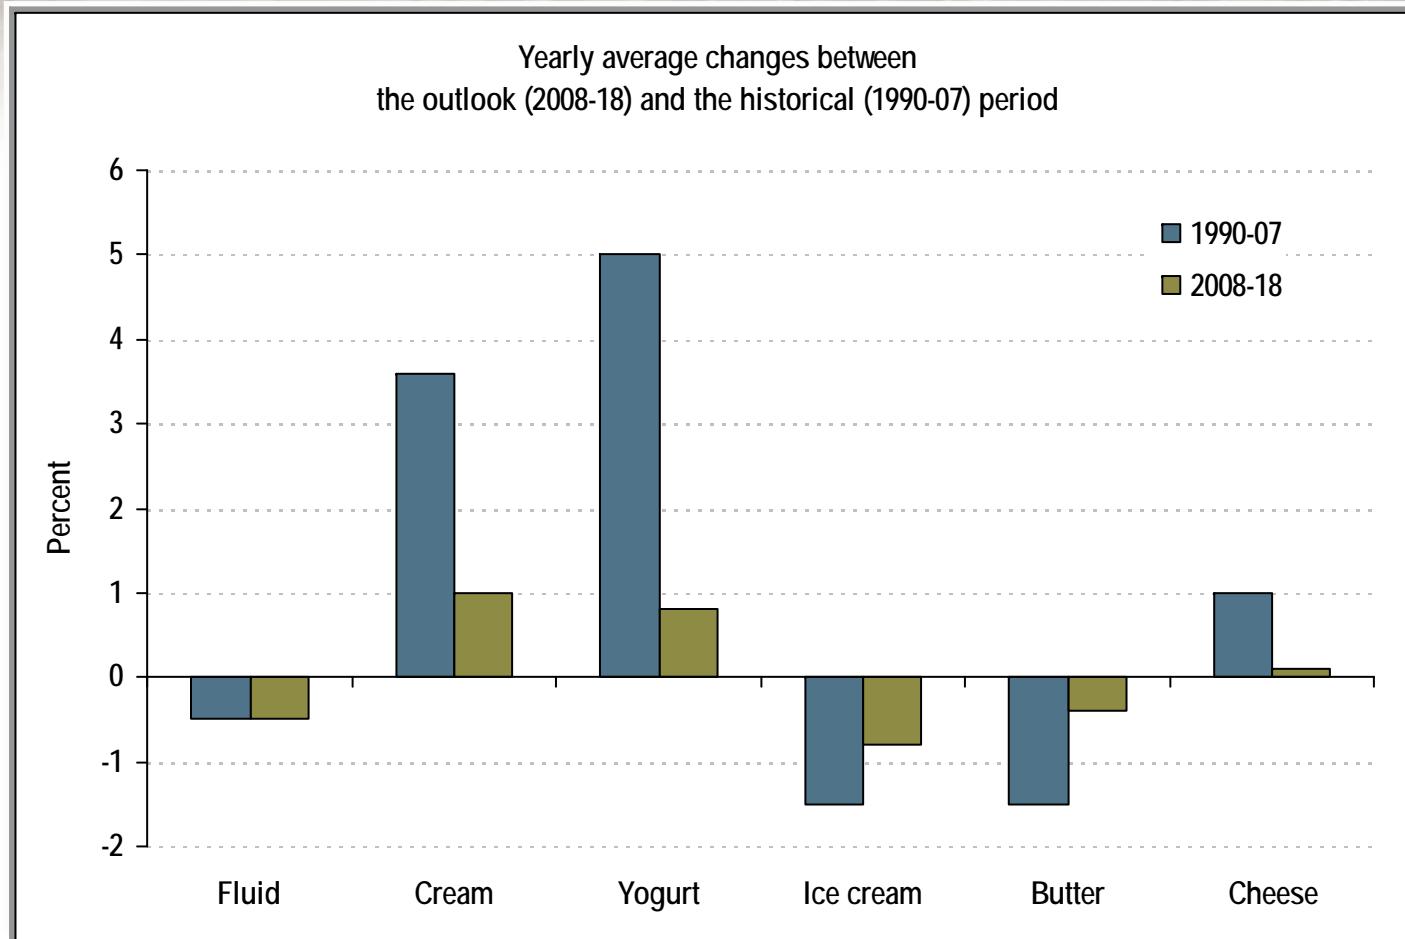

Levy includes administrative cost.

*With moderate increases, Canadian prices of dairy products are expected to remain below landed import prices*

*With a mature market characterized by a growing aging population, per capita consumption of dairy products will either continue to fall or increase less rapidly*

## *List of acronyms*

AAFC	Agriculture and Agri-Food Canada
AGLINK/COSIMO	The OECD/FAO international agricultural markets model
BSE	Bovine Spongiform Encephalopathy (a.k.a. Mad Cow Disease)
CKG	100 kilograms
COOL	Country of Origin Labeling (U.S. acronym COOL)
CWT	100 pounds
DDG	Distillers' dried grains
DW	Dressed weight
FAO	Food and Agriculture Organization (United Nations)
FARM	Food and Agriculture Regional Model
GDP	Gross Domestic Product
IMF	International Monetary Fund
LW	Live weight
OECD	Organization for Economic Co-operation and Development
OTM	Over Thirty Months
PMWS	Post-Weaning Multi-Systemic Wasting Syndrome
SMP	Skim Milk Powder
USDA	United States Department of Agriculture
WMP	Whole Milk Powder
