## **OJ Demand Estimates By Region**

### **Summary:**

OJ gallons sales for the last 52 weeks (week ending 10/30/99) are down 3.1%, compared to the previous 52 week period, due to higher OJ prices. Based on demand estimates of this study, U.S. OJ gallons sales would have been 1.6% higher than the previous 52 week sales volume, if OJ prices had not increased. Estimates of OJ demand, by region, indicate that the growth in OJ gallon sales in some cities, prices constant, is as high as 9%. These demand growth estimates, with prices constant, reflect the aggregate impact of advertising, population, income and other non-price variables. Advertising is expected to be an important factor underlying the growth rate estimates of this study, based on previous research. This report also examines per capita gallon sales by city and the impact of income on OJ demand.

### **Note:**

After this research was largely complete, data on OJ advertising was received. These data were incorporated into the demand analysis (OJ gallons were regressed on advertising, OJ and GJ prices and a time trend). The results support the initial analysis that follows. At the end of this report, specific results on advertising are presented.

### **Products, Regions and Time Period:**

The OJ demand for three product forms---NFC, RECON and FCOJ---and 52 regions (50 cities, remaining U.S. and total U.S.) was studied. ACNielsen data for the last 124 weeks (week ending 6/21/97 through week ending 10/30/99) were used.

## **Demand Relationships:**

Gallon sales for each product form was modeled as a function of prices and a time trend, by region. Income was not included in this analysis as a time series on this variable by region was not available. However, in a separate analysis of OJ demand by region but not over time, the impact of income on demand was examined. Also, data on income over time for the entire U.S. was related to OJ demand.

### **Prices:**

The prices of NFC-OJ, RECON-OJ and FCOJ, along with the price of GJ, were included in the model.

### **Population and Income Approximated by Time:**

Population and income were not included in the analysis of the regional and weekly data as observations on these variables were not available---population and income were available by city, but not by week. To the extent population and income tended to smoothly increase over this period by region, as in the case for the entire U.S., the trend variable included in the model would be expected to capture the effects of these variables.

### **Advertising:**

The trend variable was also assumed to capture the impact of advertising. Advertising has both present and lagged effects, and separating these effects from the time trend over such a relatively short period as studied is problematic.

### **Seasonality:**

Seasonality was accounted for by 52 differencing the data---comparing a week in one year with the same week in the previous year.

### **Formal Demand Relationship:**

Weekly demand for some city, for some product form can be written as

$$(1) \quad \log(q) = \beta_0 + \beta_1 (\text{time}) + \beta_2 \log(\text{NFC Price}) + \beta_3 \log(\text{RECON Price}) \\ + \beta_4 \log(\text{RECON Price}) + \beta_5 \log(\text{GJ Price})$$

or, in 52 differences,

$$(2) \quad d\log(q) = \beta^*_1 + \beta_2 d\log(\text{NFC Price}) + \beta_3 d\log(\text{RECON Price}) \\ + \beta_4 d\log(\text{RECON Price}) + \beta_5 d\log(\text{GJ Price})$$

where  $q$  is gallon sales;  $\beta^*_1 = \beta_1 \times 52$ ;  $\beta_2$  through  $\beta_5$  are price elasticities.; and  $d\log z = \log(z_t) - \log(z_{t-52})$  for general variable  $z$ , where the subscript  $t$  stands for time (week). The term  $d\log z$  is a measure of the percentage change in variable  $z$ , with  $z$  standing for  $q$  and the four price variables. Hence, the price elasticities  $\beta_2$  through  $\beta_5$  indicate the percentage change in demand for a one percent change in the price in question. Likewise, the parameter  $\beta^*_1$  is the underlying annual growth rate, indicating the percentage change in demand over time when all prices are constant. A main objective of this is to estimate the growth rate.

### **Regression Results:**

156 equations were estimated---52 regions (50 cities, the remaining U.S. and the aggregate U.S.)

times three product forms (NFC, RECON and FCOJ). Most of the R-squares were in the .40 to .70 range with the highest being .91 and the lowest being .16. Five coefficients (NFC, RECON, FCOJ and GJ price coefficients and the trend coefficient) were estimated per equation for a total of 780 coefficient estimates. About 60 percent of these coefficient estimates were statistically different than zero at the 10 % level of significance. All own-price coefficients were statistically significant.

**Demand Growth (Prices Constant) Versus Actual Changes in Demand (Price Up):**

Exhibit 1a shows actual percentage changes in demand and estimates of the growth in demand with prices constant, by city, ranked by the actual percentage change in demand. The estimated demand growth rates reflect the effects of advertising, population, income and other variables not captured by the price variables of the model. Exhibit 1b is the same as 1a except the ranking is now by the estimated demand growth rate. Note that for each region the actual percentage change in OJ demand (NFC+RECON+FCOJ) is lower than the estimated demand growth rate. This result occurred because prices were up, stifling demand. The price increases are shown in Exhibits 2a and 2b. Estimated own-price elasticities are also shown in these exhibits.

**Price Elasticity Estimates:**

The estimates of equation (1), which underlie the results in Exhibits 1a and 1b are shown in Exhibits 3 through 5. These exhibits again show the growth rates and own-price elasticities. Additionally, these exhibits show the cross-price elasticities. Note that all the own-price elasticities are negative (the law of demand---as price goes up quantity demanded goes down) and most cross- prices elasticities are positive, indicating substitution between OJ product forms, as well as GJ (as the substitute price goes up the demand for the product in question goes up).

**Price Substitution Effects:**

For example, for NFC demand in Albany, the price elasticities for the NFC, RECON and FCOJ prices were -1.16, .32 and .39, respectively; the corresponding percentage changes in prices for NFC, RECON and FCOJ were 8.8%, 5.8% and 7.1% (Exhibits 1b or 2b). Hence the predicted percentage change in NFC demand in Albany due to these price changes would be  $-1.16 \times 8.8\% + .32 \times 5.8\% + .39 \times 7.1\% = -5.6\%$ .

### **Demand for the U.S.:**

It should be noted that the demand results for the total U.S. are generally like the results for the different cities---elasticities are roughly similar and higher prices have stifled demand whether one focuses on the cities or the total U.S. results.

### **Per Capita Gallon Sales:**

Per capita gallon sales for the different product categories, by city are shown in Exhibits 6a and 6b. Exhibit 6a (6b) ranks the cities by per capita total OJ gallons sales (per capita NFC-OJ gallons sales).

### **Per Capita OJ Sales Related to Prices and Income:**

Table 6c and 6d show per capita data by four regions---Northeast, South, Midwest and West. These data show that per capita NFC gallon sales are highest in the Northeast because, in part, NFC prices are lowest and per capita income is highest there. In contrast, per capita FCOJ gallon sales are highest in the West because, in part, FCOJ prices are lowest and per capita income is lowest there. Per capita NFC, RECON and FCOJ demand relationships, estimated from the city data in Table 6c, are shown in Table 7. These data show that per capita income had a positive, significant effect on NFC demand, a negative, significant effect on FCOJ, and an insignificant effect on RECON demand.

### **Income:**

The results in Table 7 are based on city data for the last 52 week period (51 observations: an

observation on each of the 50 cities and an observation on the remaining U.S.). The impact of income on OJ demand was also analyzed using data for the last decade for the U.S. by week. The results for this analysis are shown in Exhibit 8 and 9. Exhibit 8 shows real per capita income changes for the total U.S.; while Exhibit 9 shows income elasticity estimates for U.S. OJ demand, and impacts of income on demand. These tables indicate that income has been increasing in recent years which has positively affected NFC demand but negatively affected FCOJ demand; the impact on RECON is negative but relatively small and statistically insignificant. These results support ACNielsen panel data showing a positive relationship between different household income levels and corresponding OJ consumption levels.

#### **Income Impact Implied From Panel Data:**

It should be noted that implied impacts of income (or any other variable) on OJ demand, based on the panel data, may be in error. These impacts are based on mean OJ volumes for different income categories. Such means may not reveal the true relationship between income and OJ volume sales.

For example, assume the following data by age and income.

Age Group	Number of Households			OJ Volume Sales			Avg
	Low	Income Group High	Total	Low	Income Group High		
Young	90	10	100	10.0	9.0	<b>9.9</b>	
Old	10	90	100	20.0	18.0	<b>18.2</b>	
Total/Avg	100	100	200	<b>11.0</b>	<b>17.1</b>		

These data show that on (weighted) average OJ volume sales increase with income which is just the opposite of the actual income effect which varies with age. The increase in average OJ sales by

income group is due to the increase in OJ sales due to age and the distribution of households across the age-income groups, i.e., in this example, age is driving sales, not income. Such confounding of effects may occur with other partitions of the data with respect to other demographic variables.

### **Advertising Results:**

After this research was largely complete, data on OJ advertising was received. These data were incorporated into the demand analysis. OJ gallons were regressed on advertising, OJ and GJ prices and a time trend, by city, by OJ product form. For many of the cities and product forms, the regression results did not support the expected positive relationship between OJ gallon sales and advertising---for these regressions, no relationship or a negative relationship between sales and advertising was estimated. See Table 10 which summarizes the gallon sales and advertising data, and estimated advertising elasticities.

However, the percentage change in advertising (for the most recent 52 week for which advertising data were available), by city, was positively correlated with the estimated demand growth rates (reported above), by product form (Table 11). That is, these results support the conjecture that the previously discussed demand growth are in part due to advertising.

Correlation Coefficient: % Change in Advertising and Demand Growth Rate		<b>0.27</b>	<b>0.36</b>	<b>0.38</b>	<b>0.42</b>			

(a) Positive, statistically significant advertising elasticities, estimated from a regression of gallon sales on OJ prices by product form, the price of GJ and advertising (a double log specification was used)

(b) All correlation coefficients indicate a positive relationship between the % change in advertising and the demand growth rate. The correlation coefficient for total OJ was statistically significant at the 90% level, those for NFC, RECON and FCOJ were statistically significant at the 95% level
