California Department of Food and Agriculture

Agricultural Commissioners' Crop Reports

Fresno County

1958-1962

California County Agricultural Commissioners' Reports from the California Department of Food and Agriculture. This collection consists of annual crop and livestock data from each of the 58 California Counties. The collection covers 1915-1981; digitization of the rest of the collection is forthcoming.

This digitization project was funded by the Giannini Foundation of Agricultural Economics, http://giannini.ucop.edu/.

The work was completed by the staff of the Giannini Foundation Library, University of California, Berkeley, http://are.berkeley.edu/library/. Please contact the Library to consult the originals.

The cutback in cotton acreage in 1955, 1956, 1957 and 1958 caused a diversion to other crops and many of the new crops cost more to raise than cotton and perhaps were not as renumerative, yet they brought in as much or more income to Fresno County.

IN ACCORDANCE WITH CHAPTER 2, ARTICLE 1, OF THE AGRICULTURAL CODE OF THE STATE OF CALIFORNIA

Article 1 - COUNTY AGRICULTURAL COMMISSIONER

Section 50 - COUNTY DEPARTMENT OF AGRICULTURE - There shall be the office of County Agricultural Commissioner in each county. Such Commissioner shall be in charge of the County Department of Agriculture.

Section 65 - RECORDS - The Commissioner shall keep a record of his official acts and make an annual report to the Director of Agriculture on the condition of the agricultural interests in his county as to what is being done to eradicate or to control or to destroy pests and also as to quarantine against pests, and shall furnish from time to time to the Director such info, ation as he may require.

Section 65 - REPORT - The Commissioner shall also make a monthly report to the Board of Supervisors if and when so required by said Board.

Section 65.5 - STATISTICS - The Commissioner shall compile reports of the condition, acreage, production and value of the agricultural products in his county. The Commissioner may publish such reports and shall transmit a copy thereof to the Director.

Harvesting peaches

Director of Agriculture, State Department of Agriculture,

Honorable Board of Supervisors, County of Fresno,

Gentlemen:

Fresno County has again in 1959 demonstrated that it is the leading county in Agriculture in the United States. Again we have harvested good crops, and the prices have been good.

Agriculture has in 1959 produced crops which have in value exceeded \$390,211,118.00. The farmer has not received all this renumeration for himself, and labor has been paid, banks have felt the effects of this money coming in. Merchants have taken their percent, but the gross total coming into Fresno from the crops which have been raised, has exceeded one million dollars of new outside money on the average of every day of the year.

Agriculture in Fresno is big business. The very foundation of our economy. It is a business that is not cycloidel but remains fairly constant in value year after year.

In our first 100 years of growth we grew from a few gardens at Fort Millerton to the greatest of agricultural counties. We have a good start on the second hundred years and the growth is increasing every year.

Our Department has grown with the County, 1959 has been busy. This report is to tell you something of the work of the Fresno County Department of Agriculture, its' past in helping with Fresno's development and the production figures of the County in 1959.

Test plot for the control of Russian Knapweed

PREDATORY ANIMAL CONTROL. During the past year there were 318 calls for assistance in predatory animal control in the county. With the regular trap lines and the calls, a total of 929 animals were taken.

The most serious damage was again by coyotes, bobcats and stray dogs to sheep, cattle and turkeys.

Listed is a breakdown of the numerous calls for assistance and the number of predators taken before the damage stopped.

	Calls	Predators Taken
Cattle	90 90	323 279
Sheep Turkeys	23	161
Chickens Geese	68 20	90 24
Goats Orchards	8 2	10 5
Alfalfa	3	25
	318	922

The total of 922 predators consisted of the following:

Coyotes	235	Fox	110
Bobcats	106	Raccoons	71
Dogs (wild)	94	Opossums	36
Skunks	101	Weasels	9
House cats (wild)	48	Badger dens	24
Badgers	93	Skunk dens	2

A total of 2,807 traps were set during the year. There was a poison bait program in effect. Of the 24 bait stations in use, 585 baits were taken by coyotes and bobcats.

Sr. Inspector
Roy Cowan inspecting
Nutria pens

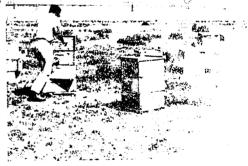

RODENT CONTROL. Ground squirrel control in Fresno County is under the direction of Sr. Inspector Conrad Schilling and is a necessary pest control function, established by law, for the purpose of preventing destruction of agricultural crops and protecting human health in the County. In 1959 ground squirrel control was done by block area covering

a total of 263,657 acres on our east side of the county. This type of program was a great success with the ranches within the block area and a great deal of cooperation was received by this Department. Because of the extensive orchard plantings on our extreme west side valley area, we anticipate an increase in ground squirrel, meadow mice and rabbit activity. This will be kept under close observation. There were 2.040 properties treated for rats and mice. including all county and city dumps. In our ground squirrel program we used 4,372 pounds of strychnine baits, 545 pounds of Fumerin, 3 pounds of zinc, 13,936; pounds of "1080", 256 pounds of methyl bromide, 3492 gallons of carbon bisulphide and 12,158 waste balls.

Inspector Sharer pointing our poisonous weeds in a horse pasture

BEE INSPECTION, under the direction of Inspector Wm. E. Cotton assisted by Phillip Siebert. The bees are far more important to the agriculture of Fresno County than the amount of revenue which they bring directly to the apiarist or that is paid in taxes to the county. If it were not for bees, our crops would go unpollenated, and therefore the crops Our seed industry is directly could not set. dependent on such pollenization. American foulbrood disease is the biggest problem that the apiarist has to face. Constant vigil must be maintained in order that this bee disease does not get out of control, for it would soon wipe out all the hives of bees in the County. In our inspection work, Mr. Cotton has endeavored to search out and check the apiaries which are brought into Fresno for alfalfa seed pollenation. The fact that the beemen are paid for this service at a specified price per hive caused many weak and diseased hives

alfalfa seed pollenation. The fact that the Inspector Kleinhammer beemen are paid for this service at a specified inspecting an abandoned apiary price per hive caused many weak and diseased hives of bees to be offered for this service. Our work has stressed the inspection of these apiaries. We individually inspected in 1959, 4,625 hives of bees. Of these we found 233 hives to be diseased with American Foulbrood. These

were destroyed by burning or were taken to a licensed wax salvage plant.

PLAGUE SUPPRESSION, is under the direction of Sr. Inspector Conrad Schilling. We made a survey during last year in the high Sierras, especially around the tourist camps looking for concentrations of squirrels. We sent in squirrels and vectors for identification to Sacramento. We must be very vigilant or else our tourist areas may become contaminated with some of the rodent carried

diseases which are transferred to man. We have located a place in Mono Basin, where we with the Health Department make checks. The Health Department asks in 1960 and 1961 that a rodent reduction program be put into operation. Because of the rugged terrain, eradication is impossible. The infected rodents which are reduced in population are the California ground squirrel (Citellus beecheyi), Golden manteled ground squirrel (Callospermophilum chrysodeirus) and common house mouse (Musculus) and rats (Ratus, sp.)

Inspector Poduska inspecting juice grapes

STATISTICS, Sr. Inspector John Bedford is in charge of this work, assisted by Inspector M. P. McQuone. Considerable time was spent during 1959 in bringing up to date the figures on the acreage of all the permanent plantings

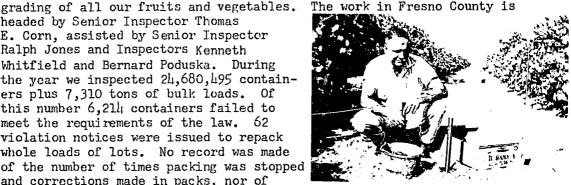

of trees and vines. This record shows the plantings of each individual farmer and the age of his plantings. McQuone made a complete survey of all the trees and vine planted areas looking for pullouts and new plantings. These figures are used by many farmers to determine the trends in planting the new varieties which are being planted and the old varieties which are being discarded for better kinds. The data from this survey is published in a separate bulletin.

Inspectors Kleinhammer and McQuone making tests on pomegranates

FRUIT AND VEGETABLE STANDARDIZATION. That California may sell its fruits in competition with those produced two thousand or more miles nearer the large centers of population, we have passed laws that compel standardized

headed by Senior Inspector Thomas E. Corn, assisted by Senior Inspector Ralph Jones and Inspectors Kenneth Whitfield and Bernard Poduska. During the year we inspected 24,680,495 containers plus 7,310 tons of bulk loads. Of this number 6,214 containers failed to meet the requirements of the law. 62 violation notices were issued to repack whole loads of lots. No record was made of the number of times packing was stopped and corrections made in packs, nor of the number of containers which were repacked by the owners on such occasions. The later would run into large figures.

Sr. Inspector Corn making a sugar test on grapes

We try to make corrections in this way when possible rather than use our police powers.

WINERY INSPECTION. All wine grapes sold on a sugar basis, must be tested by our Department. In 1959 we issued 27,800 certificates on 444,800 tons of grapes. This work is done under the direction of Senior Inspector Russell T. Hatfield.

EGG AND POULTRY INSPECTION, is under the direction of Senior Inspector Hatfield, assisted by Inspector Ray Barfknecht. During the last half of 1956, dressed poultry was added to our duties. We inspected in 1959

267 stores and dressed poultry handlers, there were 10,548 packages of poultry inspected. no violations were issued. During the year our inspectors examined 372,530 dozen eggs, writing rejections on 5,613 dozen. No record was made of eggs repacked under our direction. 94 violation notices were issued. Hatchery test eggs were our greatest problem.

Flock of white turkeys

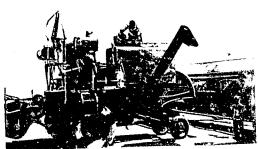

PLANT QUARANTINE AND NURSERY INSPECTION, is headed by Senior Inspector Roy M. Cowan, assisted by Entomologist H. V. Dunnegan. All plants used in Fresno County must by law be inspected for disease, insects or other pests, before it is delivered to the planter, whether they come in by mail, express or freight, and those infected or infested destroyed. During the season we looked individually at 8,491 shipments of trees, vines or other nursery stock that came into our county, and Mr. Dunnegan went through every nursery, plant by plant, at least twice during the season. 43 shipments of infested or infected nursery stock were destroyed, treated or sent out of the county. Under the clean grain program we found it advantageous to make field inspections for all farmers who tell us they wish to have field inspections. We can save more time in giving clean grain certificates than if we looked at each load, especially when these shipments are taken right from fields into bins. We now have 3 certified mills which are authorized to take in contaminated grain and where this infested grain can move directly to these mills. We demand a notification of when these loads arrive and how they are stored. These certified mills can and do process this grain so weed seeds can no longer be a hazard. This also helps greatly in our grain inspection. Clean grain certificates are given to loads

Entomologist Harry Dunnegan holding a jumbo grape rooting

going to other counties when grain meets the requirements and when application is made. We honor certificates from other counties in the State. There were 2,036 truck shipments and 982 rail shipments made under this program.

SEED INSPECTION, also under the direction of Senior Inspector Roy M. Cowan, assisted by Inspectors LeRoy West, Danny Kleinhammer, Ross Stuart, Jack Michel, A. I. Harrison and Phil Siebert. The seed industry is growing rapidly in Fresno, especially the certified seed is worthy of special notice. It has grown from nothing in twelve years to a crop bringing \$11,836,446 into our County in 1959. Our part of the program is to see that the seed is harvested from clean fields; that the harvesters are cleaned when they go from one field to another, thereby avoiding mixing varieties; supervising the cleaning of the mills after each variety is cleaned and that the seed does not lose its identity from the field to the sealed, tagged sack. All the expense for the work of this seed program is reimbursed to the county by the California Seed Improvement Program. Aside from this certified seed inspection, the growing grain fields are patroled during the growing season and where primary noxious weeds are found growing, the grower is compelled to clean the grain or his grain is quarantined on his place.

Inspector Stuart inspecting a seed harvester

PEST CONTROL AND SURVEYS, this division is under the direction of Senior Inspector John A. Bedford, it has been busy all season. Fresho County is we believe free from Khapra Beetle, but every year we look again to see that nothing has been missed. We made a very thorough inspection for Pink Bollworm and cotton diseases using inspection of bolls from every square mile, samples of gin trash at gins and using light traps. We have

also made inspection for Angular Leaf Spot of cotton. Our surveys for Red and Yellow Scale continued. we now have the two Red and Yellow Scale Districts, which eradicates the pests but it is still our responsibility to watch and see there is no spread. We have made a complete survey for Quick Decline, finding none in established trees. We do find Meyer lemon trees which it is illegal to have growing in the Eastern part of Fresno County. We have a detection survey looking for new nematodes. We will continue looking for Japanese Reetle, Imported Fire Ant, and Mexican Oriental Fruit Fly. There is a survey being made each year for Peach Mosiac, Yellow Bud Mosiac, and virus diseases of

A type "A" pest, (Prostep hanus truncatus) found in a mask from Mexico

plums and other stone fruits. Spotted alfalfa aphid has not bothered us as much this last year, although spray materials are being applied for it's control. These surveys are headed by the State Department of Agriculture, they and sometimes the Federal Department of Agriculture bearing part of the cost. We share our part in these surveys and really head these programs.

Chemicals used to combat agricultural posts in Fresno County during 1959 by post control operators or farmers themselves, were the following dust or sprays. Senior Inspector L. M. Cox was in charge of issuing permits to apply hazardous insecticides.

83,876,803 pounds containing chlorinated hydrocarbons
8,941,259 pounds containing phosphates
8,774,679 pounds containing other miticides
73,259,505 pounds containing sulphur
2,743,863 gallons containing copper
630,711 gallons containing lead
1,482,810 gallons containing defoliant
41,324 pounds containing nematocides
2,607,232 pounds of granular weed killers
521,823,378 gallons of oil and other weed killers
522,640 gallons of 2,4-D and other translocating materials

WEED ERADICATION, is under the direct supervision of Senior Inspector Conrad Schilling. Our work has been an endeavor to attach the smaller, newer infestations of weeds before they become large, rather than working on the larger ones. Under our county assistance plan we have treated with good results

acres of Russian Knapweed 81.75 acres of White Horsenettle 3.68 acres of Morning Glory 278.83 miles of intersections and bridges 4,897 miles of county roadsides treated for Russian Knapweed 1108 miles of county roadsides treated for White Horsenettle 143 miles of county roadsides treated for Hoary Cress 35 miles of county roadsides treated for Morning Glory 2,946.30 miles of state highways treated for Russian Knapweed 54 miles of state highways treated for Morning Glory 61 miles of state highways treated for Yellow Star Thistle 161

The county furnishes one-half the cost of material and the cost of application up to two acres. But from two to ten acres, the county only furnished the cost of applying. The following materials were used.

2 900	pounds of Sodium Chlorate
3,800	gallons of Benzoiac acid
3,084	
1,159.75	pounds of Amitrol
2,452	pounds of Telvar
63	pounds of Delapon
5,381	gallons of weed oil
1,255	gallons of Carbon Bisulphide
21,852	pounds of Ureabor
940.50	pounds of Simazin
3,800	pounds of Chlorea granular
43,468	pounds of Chlorea powder
17	Quarts of X-77
6	pounds of X-77
15.75	gallons of sodium arsenite
2,065	pounds of Benzabor
10.33	gallons of 2,4-D

Inspector Quick discussing a rodent problem with a farmer

The figures given in the statistical part of this report, which follows, have been gathered from sources which we believe to be the best obtainable. Also we believe them to be as accurate as such figures can be reasonably expected. In every case, we have gone to more than one source, often to from five to six sources, before we determined on a statement. The sources for each statement have been recorded and are on file.

There are three ways of gathering crop reporting data:

- 1. To ask each and every person how much they produced of every commodity. This is the way the Federal census is taken. Too often these figures are given distorted for fear that the data given will be reflected in the income tax or County tax. Often the grower only has a vague memory of what he produced months before.
- 2. Another way to get a crop report is to take the known acreage of each commodity, then to multiply these figures by a determined percent of crop, which has been thought to represent the condition of the crop for that year. This is obtained by drawing a card from the file every so often from the list of growers and asking them for their estimates. Its weakness is in the fact that the condition of the crop which is used, if it be off a small part of one percent, will make a large difference in the report results.
- 3. The third, and the one which we believe to be the most accurate way of obtaining a crop report, is to go to every packing house, every processing company, every cotton gin and every dealer and obtain their figures of the amount which they marketed. We check this against our inspection records. These figures as to production are then multiplied by the amount which the commodity brought to the farmer at the car door, here in Fresno.

Fresno has grown during the years gone by. Each year sees more and more land come under cultivation. Most of this new land has been growth on our "west side". With this growth has come increased revenue to Fresno County.

To the many friends who helped us with this report, we wish to express our thanks.

Sierra Forest Photo

The cutback in cotton acreage in 1955, 1956, 1957, 1956 and 1959 caused a diversion to other crops and many of the new crops cost more to raise than cotton and perhaps were not as renumerative, yet they brought in as much or more income to Fresno County.

Our records show:

OFFICE OF

AGRICULTURAL COMMISSIONER

L. D. McCORKINDALE Commissioner P. O. BOX BOI 1720 SOUTH MAPLE AVENUE FRESNO, CALIFORNIA

PHONE AD 3-2181

March 21, 1961

Mr. Charles Paul, Director California Department of Agriculture and The Honorable Board of Supervisors County of Fresno

Henry J. Andreas, Chairman

Norman S. Foley George E. Malm Sloan P. McCormick Floyd Olsen

Gentlemen:

In scanning this report one may question certain changes from the past in the method of compilation and style of presentation. Those questions may be answered if I preface this publication by certain pertinent remarks.

Section 65.5 of the California Agricultural Code states in part that "The commissioner shall compile reports of the condition, acreage, production and value of the agricultural products in his county". Accordingly all financial statistics shown herein reflect the gross value of the agricultural commodities produced in Fresno County and not the net profit to the producer.

Page two graphically illustrates what average portion of the dollar a grower actually receives as net profit. Please note additional explanatory remarks on that page.

Page three is an attempt to very briefly summarize the most important observations concerning Fresno County agriculture during 1960.

Crops, acreages, yields and values are all listed in the standardized method now being adopted by the majority of County Agricultural Commissioners throughout California. In this, my first year as Agricultural Commissioner of Fresno County, it is my intention to issue a report in such form that subsequent editions may be published in like pattern and thus promote ease in comparison of statistics during future years.

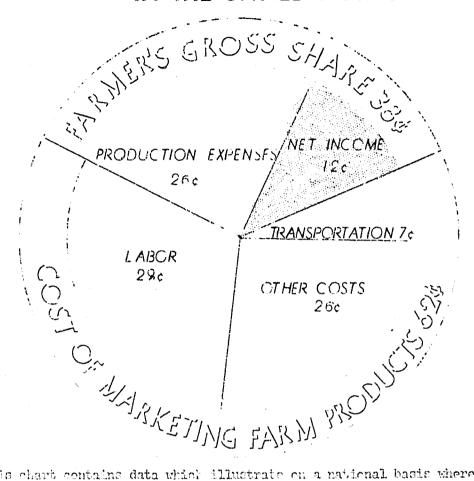

My sincere appreciation is gratefully extended to the dedicated members of my staff, to the many producers contacted, growers' associations contributing to this report, the Farm Advisor's Office, A.S.C. Office, food processors, produce dealers, beekeepers, and to all of the other individuals and organizations consulted prior to the printing of final statistics.

Respectfully submitted,

L. D. McCorkindale

Agricultural Commissioner

WHERE THE CONSUMERS FOOD DOLLAR GOES IN THE UNITED STATES

This chart contains data which illustrate on a national basis where the consumer's food dollar goes. It may or may not be characteristic of Fresno County, although it is representative of agriculture in general.

As indicated above, the farmer's gross share of the consumer's dollar fell th 36% in 1960. This represented an all time low and a decrease of 12¢ since the years homediately following World War II, when it was 50% per food dollar spent. From this 33% the farmer spent 26% in producing the product for market and was left with only 12% as a ware for himself, his family, and a return on his investment in farming.
Although the prices received by farmers and their gross income remained

relatively stable in 1960, costs of production again increased. Hired labor, for expected, tent up h percent over a year earlier, and taxes and interest rose S and

10 pareent, respectively.
The fall in the farmer's share of the consumer dollar was caused by numerous factors, among then increased packaging costs and increased demands for more packaged foods. These factors contributed to a small rise in the consumer food bill in spite of the fact that the farmer received a reduced share in 1960.

Marketing costs made up almost 2/3 of the consumer food bill. Labor comprised the largest single cost of marketing farm products. Other costs included a variety of items considered as general overhead expenses.

(Source: Statistics compiled by the California Department of Agriculture from various publications of the United States Department of Agriculture.)

AGRI-LITES OF 1960

Every known avenue of information was explored by this office in an effort to make this annual report factual and complete. In doing so we verified that predictions advanced during the year concerning certain crops proved to be correct in several instances.

Total grass value of all crops for the year 1960 drapped under that of 1959 by none than \$8,700,000. However, the year 1960 exceeded 1958 by almost 10% million dollars.

Compared to 1959 the commodity group values of field crops, seed crops and veretable crops did not show appreciable differences. Fruit and nut crops were definitely in contrast with a decrease of nearly \$22,000,000 from last year.

Nursery products passed the half million dollar mark for the first time on reacrd. Livestock and poultry jumped more than $12\frac{1}{2}$ million dollars over last year, primarily due to a marked upturn in cattle feed-lot operations and a more thorough method of obtaining statistics by departmental personnel.

Cotton, Fresno County's most important field crop, slipped below the per acre yield of 1959 due to difficult weather conditions during the last half of picking, coupled with flower and boll drop as the result of extreme summer temperatures. Total acreage was up because of increased plantings under the "B" plan as permitted by the Agricultural Stabilization and Conservation Committee.

Barley grain, largest cultivated crop acreage-wise in the County, was giving way to higher income crops in some areas and committed to summer fallow in other sections because of the small margin of profit to be gained in producing it.

High temperatures, plus plants needing water at critical periods reduced yields of most seed crops. An increase occurred in the planting of European varieties of alfalfa seed for European markets. Although produced under certified seed conditions, these foreign types have not been officially certified as yet. It is probable that low prices received for the 1960 certified Ranger alfalfa seed crop (which comprised nearly 50% of the acreage of all certified alfalfa seed) will cause removal of several thousand acres before the 1961 crop year. Overproduction in recent years has been one of the major factors in creating this situation.

Grapes accounted for the major reduction in total value of the "Fruit and Nut Crops" division of this report when one compares it with last year. Although the bunch count appeared normal, packing procedures revealed that the weight factor was below normal. In addition yields were reduced because of decay in the bunches forcing heavier cullage by packing houses during a portion of the picking season. Diversion of more grapes to the wineries at lowered returns to the grower decreased the over-all value of the grape crop.

Although many problems still exist for Fresno County's agricultural future, the general intense interest being exhibited by its citizens in their mutual difficulties will in itself insure the solving of those problems.

OFFICE OF THE AGRICULTURAL COMMISSIONER

California, Counties

MMXY 22 1962

LIBRARY

OFFICE OF

AGRICULTURAL COMMISSIONER

L. D. McCORKINDALE Commissioner

P. O. BOX 801 FRESNO, CALIFORNIA 1730 S. MAPLE AVE. PHONE AD 3-2181

March 22, 1962

Mr. Charles Paul, Director California Department of Agriculture

The Honorable Board of Supervisors County of Fresno

Gentlemen:

Henry J. Andreas, Chairman

Norman S. Folev

Sloan P. McCormick

George E. Malm

Floyd Olsen

This report is substantially in the same standardized form as published last year, except for certain improvements. For comparison purposes the 1960 crop statistics are listed immediately below the current year's data. Such procedure is a first for Fresno County Annual Crop Reports. This effort is another step towards issuing a record which may be both interesting and factual.

Because the "cost-price squeeze" is discussed so frequently by persons engaged in the many facets of agribusiness, page 2 is included to graphically chart the decline since 1950 in the farmer's share of the consumer's retail food dollar.

"Agri-Lites of 1961" briefly reveals the outstanding factors and trends which influenced Fresno County agriculture during the year.

If one compares the data shown for 1960 in this issue with the 1960 Crop Report published a year ago, he will find certain discrepancies in some crops. These are the result of rounding out figures, as well as the revising of information based on additional facts gained after the 1960 publication date.

My sincere appreciation is gratefully extended to the dedicated members of my staff, to the many producers contacted, growers' associations contributing to this report, the Farm Advisor's Office, A.S.C. Office, food processors, produce dealers, beekeepers, and to all of the other individuals and organizations consulted prior to the printing of final statistics.

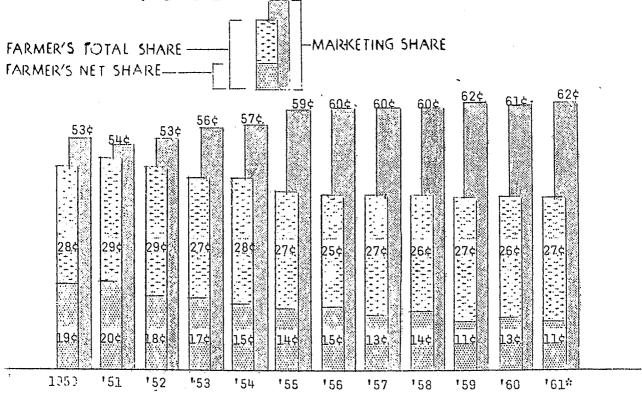

Section 65.5 of the California Agricultural Code requires the compiling of this record. Please note that this report deals with the gross value of agricultural products and not the net return to the farmer.

Respectfully submitted,

L. D. McCorkindale

Agricultural Commissioner

FARMER'S SHARE OF CONSUMER'S RETAIL FOOD DOLLAR DECLINES

* 1961 is estimated

Sources: U.S.D.A. Chart Book and National Data Book, 82nd Edition

Consumers in all walks of life are interested in an abundance of healthful foods available at all seasons of the year at reasonable prices.

Our agricultural producers are producing a generous abundance in quantity and variety and they are doing it with a high degree of efficiency at very low prices.

Farmers are supplying the market at prices that are too low to provide a proper income for their labor, management, and investment in comparison with other kinds of businesses. So long as this disparity of income prevails, agriculture cannot buy the products of industry as well as it should. Nor can rural people buy as many of the services of business and the services of the scientific professions as would be possible and desirable in a more balanced economy.

The number of farms in the United States is decreasing by the hundreds of thousands each year. Production, however, remains high because much of the land continues in production as a part of other farms, and the economic and organizational forces for increased production remain strong.

Farm prices are not causing increases in the cost of living. The farmer's share of the consumer's dollar spent for food has been decreasing. Wage earners and salaried workers have been using a lesser portion of their total earnings for food.

AGRI-LITES OF 1961

Each agricultural season has its individual variations when compared to prior plant growth and harvest periods. The 1961 crop year was no exception.

Weather: Low rainfall marked the winter of 1960-61 and found many growers irrigating during the early part of March. Soil moisture conditions were considered critical by numerous farmers at an early date during the growing season.

Minimum thermometer readings down to 25 to 22 degrees in early January resulted in some citrus crop losses.

Temperatures renging up to 110 degrees during June persisted long enough to damage grape vines, grapes, walnuts, plums, citrus, and other commodities. Soil moisture was further depleted by the extreme heat.

Field Crops: Cotton, king of the field crops in Fresno County, dropped over \$13,000,000 in gross value because of two prominent reasons. First, government acreage allotments were more than 30,000 acres under those of 1960. Second, average yields per acre for 1961 did not come up to early expectations and were found to be under those of 1960 when final figures became available. Higher values per bale did not substantially off-set the large acreage and yield decreases.

Gains in acreages and values were experienced in dry beans, rice, safflower and sugar beets; but losses in barley, alfalfa, and sorghum grain nullified these advances.

Final tally of all field crops showed a net reduction in gross value of \$14,485,870 from 1960.

Seed Crops: Predictions made in the 1960 Crop Report proved to be true. Certified seed alfalfa experienced a substantial reduction of more than 13,000 acres from last year. Ranger and Vernal were the two varieties most affected. Factors primarily blamed for the decrease were the lack of water, low prices in 1960, and the interest in growing other crops such as safflower and sugar beets.

European and propietary varieties of alfalfa seed have gained prominence. Strange varietal names such as Schleisische, Arnims, Altfranken Steinbach, Flandria, Orchesienne, and Jokioinen have made their appearances.

Vegetable Crops: Cantaloupes, green onions, potatoes and tomatoes were in the million dollar bracket. Easily the most valuable crop was cantaloupes, accounting for over 60% of the gross value of all the vegetables grown in the County. High summer temperatures definitely decreased watermelon yields. Tomato returns and yields were good.

Total worth of all vegetable crops grown was slightly above the 1960 figure as indicated by the sum of \$25,073,380 for 1961.

Fruit & Nut Crops: In this category Mother Nature began the season with a promise of bumper crops considerably in excess of normal. She then proceeded to revert to her own whimsical self by a display of extreme heat in June which damaged various crops.

Surprisingly enough, however, the heat injury did not lower production enough to prevent a \$10,033,550 increase in the 1961 total value of fruit and nuts over

196Ō.

Thompson seedless grapes had a difficult time meeting legal maturity requirements until late in the season. Contributing factors were thought to be damage to vines during the high temperatures, overcropping of the vines, increased use of gibberellin sprays, and shortages of soil moisture. Because of adverse conditions cullage of Thompsons for table use tended to be in excess of normal in packing houses during 1961.

During raisin harvesting operations most tray counts tended to run high. However, unfavorable drying ratios reduced this condition to a fairly normal raisin yield.

Emperor grape yields were low, but market acceptance and monetary returns were good.

Despite unfavorable natural soil moisture conditions most deciduous fruit varieties formed sufficient fruit for good yields. One exception to this was a substantial drop of plums in May in some orchards.

Excessive temperatures caused a heavy June drop of oranges. Freezing injury late in the year gave added trouble to citrus growers.

Internal heat damage to plum varieties such as Late Santa Rosa, Queen Ann, Duarte and Ace caused heavy cullage and subsequent reduced yields. Growth cracks created by an unseasonal rain also proved to be of concern in the Late Santa Rosa plums.

Nursery Products: An increase in the total value of nursery stock produced in the County could be largely attributed to citrus and vegetable plant production.

In citrus nursery stock such popular varieties as Frost nucellar navel orange and the Olinda Valencia orange were apparent. Troyer, Trifoliate, and Rough Lemon were the principal rootstocks used.

There was a decided decrease in the acreage of grape rootings.

<u>Livestock and Poultry:</u> Additional feed yards built in the County, and more cattle in the existing lots, caused a \$2,230,654 increase in beef cattle values.

A reduction in horse and mule populations was the result of work demand. Hogs decreased due to some swine ranches going out of business. Local hog producers could not compete favorably with pork imports, it was reported.

Laying hen flocks were not replaced during 1961 at so frequent intervals as in prior years. Poor prices paid for the birds when sold for meat was given as one of the reasons for the egg farmers holding layers for a longer period of time.

High mortality rates from adverse summer and winter weather, plus increased feed prices, were blamed for the reduction in rabbits.

Fresno County

Climatology and Geography

Almost in the center of California, Fresno County stretches for approximately 150 miles across the San Joaquin Valley.

Many extremes are found from one end of the County to the other, as indicated below:

Highest elevation (High Sierras on East) Lowest elevation (flat lands in West) Transition in Life Zones range from Sonoran to Alpine.	14,254 120	
Rainfall (maximum, including heavy snows in mountains)	60	inches
Rainfall (minimum in semi-arid west portion)	7	inches
Approximate average yearly rainfall for County	9.5	inches
Average maximum temperatures	76.3	0
Average minimum temperatures	50.1	0
Mean temperature	63.2	
January temperatures - range	38° -to-54	
July temperatures - range	65° to 9.9	0
Growing season - average	292	days

There are approximately 8,340 farms in the County averaging 274 acres in size.

Approximately 200 crops may be grown in Fresno County. About 60% of the land area is in farms.

Land Uses

Total Cropland Irrigated land (1,245,360 acres) Non=irrigated land (75,690 acres)	1,321,050	acres

April 19, 1963

Charles Paul, Director
California Department of Agriculture
and
The Honorable Board of Supervisors
County of Fresno

Sloan P. McCormick, Chairman Henry J. Andreas George E. Malm Norman S. Foley Floyd Olsen

Gentlemen:

13

As shown by the total crop value of all agricultural products in Fresno County, the year 1962 exceeds all others on record. Because of the considerable increase over any prior year the statistics contained herein have been carefully checked and evaluated. We have endeavored to cover all phases of agriculture in the County to obtain as realistic figures as possible.

One of the interesting features of the 1962 crop year was a complete survey of the fruit, nut and vine crops in Fresno County by personnel of the California Crop and Livestock Reporting Service of the State Department of Agriculture, with the Agricultural Commissioner cooperating. For the first time in the State the survey was conducted by using aerial photographs in searching out each property to be reported. Results of this survey are shown in brief on the last page of this report.

As in prior years this annual report has been made possible only because of the wonderful cooperation from the people concerned with the many agricultural commodities produced in the County, and due to the painstaking efforts of my staff in the Agricultural Commissioner's Office. I gratefully acknowledge the assistance I have received from the many producers consulted, the growers' associations contributing to this report, the Farm Advisor's office, the A.S.C. office, the various food processors, the beekeepers, and to all of the other individuals and organizations contributing knowledge which was used in making up this record.

Once again it must be emphasized that this crop report deals with the \underline{gross} value of agricultural products and not the net return to the farmer.

Section 65.5 of the California Agricultural Code requires that an Agricultural Commissioner shall compile reports of the condition, acreage, production, and value of the agricultural products in his county.

Respectfully submitted,

L. D. McCorkindale

Agricultural Commissioner

WHAT IT COSTS TO MARKET FARM FOODS

The farm food marketing bill in the United States was \$41.4 billion in 1961, the latest figure available. It has risen by almost three-fourths since 1950. Increases in quantity of food products marketed, and more and costlier marketing services per unit of product have contributed almost equally to the rise.

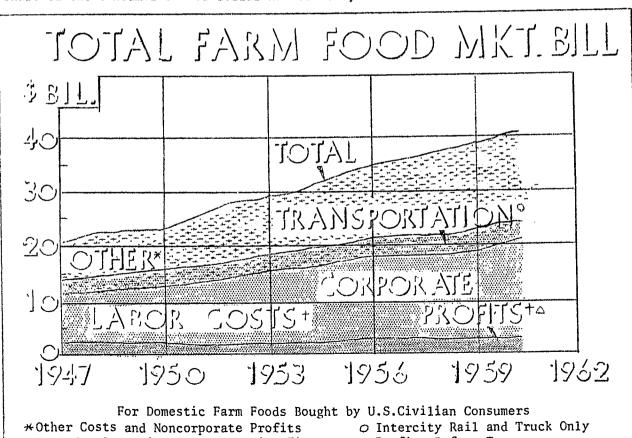

The marketing bill is the estimated total cost of assembling, transporting, processing, wholesaling, and retailing domestic farm-grown foods bought by civilian consumers in this country.

Labor costs are the largest single component. They were estimated at \$19 billion in 1961, a rise of 60 percent since 1950. Factors in the increase were about three parts greater volume marketed and two parts higher unit labor costs which reflect rising wage rates and supplements.

Transportation charges by railroads and motor carriers were over \$4 billion in 1961. They increased by two-thirds from 1950 to 1961. Higher rates, increased volume, and longer hauls all played a part.

While the total marketing bill has increased by almost three quarters since 1950, other costs, as a group, have doubled, and the individual items of rent, depreciation, and interest have tripled or nearly so.

The preceding statements clearly indicate some of the reasons why the farmer's share of the consumer's food dollar has steadily diminished since 1950.

A Profits Before Taxes

AGRI-LITES OF 1962

For the first time in the history of Fresno County the gross value of all agricultural products passed the \$400,000,000 mark for a total of \$413,572,210. This considerably exceeds the next closest year of 1959 of \$390,211,120. It is well to repeat that this reflects the gross value of the agricultural products and does not reflect the net income to the producers involved.

Specifically, the increase can be attributed primarily to cotton with a jump of \$10,000,000 over 1961. A long dry fall and excellent harvesting conditions were principally responsible for the excellent yield.

Grapes with its various products was the other primary crop responsible for the 1962 increase in gross value. Here almost \$13,000,000 was reflected in the 1962 figures over 1961. Major markups in other crops included large increases in Safflower and Beef Cattle.

Weatherwise 1962 started off with unusual conditions. February, as an example, was the wettest February in Fresno's recorded history. The average temperatures for the month were one and one-half degrees below normal. The total sunshine for February was only 41 per cent of the maximum possible. Generally, however, weather conditions for most of the year were conducive to good plant production as exemplified by the heavy yields in the major producing crops.

Yields were up in $\underline{\text{grain}}$ crops because of the ample spring rainfall and more irrigated land. Sheep $\underline{\text{men paid less money to alfalfa growers for winter pasture}}$ because of the adequate forage on non-farmed lands.

Because of the tremendous increase in <u>Safflower</u> acreage from approximately 7,000 to 58,000 acres, the value of the crop increased from approximately one-half million dollars in 1961 up to near the seven million dollar figure in 1962. Further reasons for the great increase in acreage were new varieties introduced, better cultural practices, and a higher guaranteed price to the producer:

Sugar beet acreage and total value were down in 1962 because an unfavorable crop year and exceptionally hot weather conditions in 1961 caused crop damage and a resultant pessimistic outlook on the part sugar beet growers. Per ton returns, however, were much better in 1962 than in 1961.

Although prices for certified alfalfa seed were generally up in 1962 over the previous year, producers had not yet gained confidence in the crop as shown by the 17,000 acre reduction in plantings. Of course, the land vacated by certified alfalfa was replaced by safflower and other crops. Low yields of certified alfalfa seed in recent years can be charged in part to lower prices received and insufficient water applied if it was needed on other crops such as cotton. Principal reasons for the gross value of seed crops being more than \$2,000,000 under last year were caused by land being planted to more attractive crops such as safflower, and the generally smaller profits realized from seed crops in recent years, and because of the competition with certified alfalfa from higher paying crops.

Noticeable gains in values were experienced in such vegetable crops as <u>cabbage</u>, <u>sweet corn</u>, <u>cucumbers</u>, <u>watermelon</u>, <u>peppers</u>, <u>radishes</u>, and <u>romaine</u>. Hot weather during the summer of 1961 had decreased yields in some of these vegetable crops and 1962 figures more nearly indicated a normal crop year.

Cantaloupes, the major vegetable crop for Fresno County, had an almost two and one-half million dollar drop in value due to the low price received per ton. Because of this lower price some fields were picked only once, thus reducing the volume moved to market. Except for watermelons, other miscellaneous melons generally were marketed at lower prices and subsequent decreased gross values are shown. An approximate three and one-half million dollar decrease in all vegetable crops is shown for 1962 when compared with 1961.

Fruit and nut crop totals in value showed a substantial ten and one-half million dollar gain over 1961. As explained previously this was primarily due to grape products. Almonds were down in yield and up in price. Low yields were attributed to irregular sets of nuts on the tree and a larger proportion of the bearing acreage being young trees with lower yields.

The 1962-63 survey of fruit crops in Fresno County indicated an increase of more than 4,000 acres of all bearing grapes, primarily in the raisin variety category. A substantial increase in the "fresh" classification of raisin grapes is primarily due to progressive changes in the utilization of these varieties. Fresh shipments of both muscats and Thompsons are on the increase, particularly an increase in volume of muscats being packed for eastern shipments resulting in the greater tonnage under the "fresh" classification.

Grape crush percentages also showed a substantial increase over those of 1961 as result of the allocation of a larger portion of the Thompson crop into these channels. Raisin yields were generally down from 1961. However, yields from vineyards howested last during the season produced larger yields and consequently tended to offset lower yields before early September.

Average rates for table grapes showed a substantial increase for 1962. This was largely due to better prices received for Ribiers, Khandahars, Italias, Cardinals, and other table varieties.

Most varieties of <u>wine grapes</u> were up in yield from 1961. Large allocations into "crush" resulted in considerable reduction in demand and prices paid for wine grapes. Some increase was noted in the tonnage of wine varieties going into fresh shipments.

<u>Dried nectarine</u> production increased and prices were up due to <u>dried peaches</u> being in somewhat short supply. This resulted in more nectarines being dried and marketed under favorable demand.

The <u>Valencia</u> orange crop suffered heavy frost damage in late February. This resulted in a large percentage of Valencias going to by-products. This accounts for the considerable decrease in value of fresh shipments.

Bearing acreage of all peaches was reduced by more than 2,800 acres as result of the 1962-63 fruit tree survey. Generally new acreage of peaches coming into full production in the future will probably result in a substantial yield increase. Many marginal orchards are being pulled and this tends to boost the yields per acre. Clingstone peach bearing acreage showed a substantial increase as result of the survey Yields are also steadily increasing as new orchards come into full production. Freestone peach acreage was reduced by more than 3,000 acres. Yields were slightly up. Dried peaches were in short supply and prices were up.

Agri-Lites of 1962 - continued

Plum yields were about the same as 1961 but acreage increased somewhat.

All nursery products experienced nearly a \$100,000 jump from 1961. A good many items were responsible for this, but primarily increases were shown in bedding plants, "Frost Nucellar" types of orange trees in the navel variety, the Olinda strain in Valencia orange trees, the Satsuma Mandarin orange, Thompson grape vines, and vegetable plants such as tomatoes and peppers. Of interest is a large decrease in plantings of Washington navel oranges, which are being replaced by the Frost Nucellar type. This is caused by the trend toward planting nursery stock resistant to the Quick Decline virus disease of citrus on certain other root stocks.

Livestock and poultry advanced in gross value more than \$8,000,000 over 1961 totals. As indicated previously, this increase is primarily due to beef cattle sold from feed lots. An interesting increase in recreational stock as far as horses and mules are concerned was shown with a resultingly larger decrease for 1962 in work stock. Livestock and poultry production totals remain essentially the same as last year.

Fresno County

Climatology and Geography

Almost in the center of California, Fresno County stretches for approximately 150 miles across the San Joaquin Valley.

Many extremes are found from one end of the County to the other, as indicated below:

Highest elevation (High Sierras on East) Lowest elevation (flat lands in West)	14,254 ft. 120 ft.
Transition in Life Zones range from Sonoran to Alpine Rainfall (maximum, including heavy snows in mountains) Rainfall (minimum in semi-arid West portion) Approximate average yearly rainfall for County Average maximum temperatures Average minimum temperatures Mean temperature January temperatures - range July temperatures - range Growing season - average	60 inches 7 inches 9.5 inches 76.3° 50.1° 63.2° 38° to 54° 65° to 99° 292 days

There are approximately 8,340 farms in the County averaging 274 acres in size.

Approximately 200 crops may be grown in Fresno County. About 60% of the land area is in farms.

Land Uses

Total Cropland	1,321,050 acres
