## 1970 MINNESOTA FARM BUSINESS SUMMARIES BY TYPES OF FARMING FOR SOUTHERN MINNESOTA

Truman R. Nodland, Edgar A. Persons and Janet B. Otis\*

### Introduction

This report summarizes the 1970 farm business records by types of farming for 800 southern Minnesota farmers. Farm records were supplied by the area vocational-technical schools at Mankato, Austin, Winona, Willmar and Jackson, and the Southeastern and Southwestern Minnesota Farm Management Associations. The area included in this report can be roughly defined as the region south of a line drawn from Elbow Lake to Hastings, Minnesota. This publication will be useful to farmers, teachers, extension workers, researchers, and others who desire specific information about costs and returns from farming operations by types of farms.

Records were obtained from 11 types of farms for this report (table 1).

Farms were classified according to the source of cash income received from various livestock enterprises and from the sale of crops. The following classifications were used:

- 1. Specialized farms 80 percent or more of the cash income was from one enterprise or source.
- 2. Two enterprise farms 80 percent or more of the income was from two enterprises, with a minimum of 20 percent from the smallest of the two.
- 3. Three enterprise farms 80 percent or more of the income came from three enterprises, with a minimum of 20 percent from the smallest.

<sup>\*</sup> Agricultural and Applied Economics, Agricultural Education, and Agricultural and Applied Economics, respectively.

The authors are indebted to Dorothy T. Spreck for making many of the calculations included in the tables appearing in this report.

Specialized dairy farms are further divided into four categories based on the average number of dairy cows maintained. Fattening hog operations are reported in combination with cash crops. All other types of farms which include hogs are based upon complete hog programs (farrowing and finishing).

Table 1. Number of Farms by Type Included in This Report, 1970

Туре	Number
Cash crops	73
Dairy - 25-34 cows	50
- 35-44 cows	44
- 45-54 cows	22
- 55 cows and over	32
Hogs (complete program)	20
Dairy and hogs (complete program)	55

Hogs (finish) and cash crops	30
Hogs (complete program) and feeder cattle	35
Hogs (complete program) and cash crops	129
Feeder cattle and cash crops	63
Dairy, hogs (complete program), and cash crops	33
Hogs (complete program), feeder cattle, and cash crops	<u>77</u>
Total	800

Because farmers included in this study are, in general, above the average in managerial ability and operate larger and more productive farms, their returns to labor and management are higher than the average returns that may be reported in census type data. Wide variations in management and practices followed do exist between farms. It can be assumed that similar variations occur among all farmers in the area.

### Capital Managed and Earnings

The average value of capital used per farm for the various types of farming is reported in table 2. These data represent values as reported by farmers in their farm business records. The values deviate somewhat from current market

values for assets with a long useful life, such as real estate. Real estate improvements are customarily valued at cost and depreciated on the basis of estimated life. In periods of rising prices, book values upon which this table is based tend to be below present market values. Land is also valued at cost and has not been corrected for the price inflation which occurred after many of the farms were purchased. Capital managed includes the value of all farm assets owned by the operators and those assets used by operators but owned by landlords.

Capital managed per farm varied widely between the types of farming included in this study. Among the factors contributing to the wide variation are the number of acres per farm, value of land, investment in livestock, and the buildings and equipment associated with each type of farm. Types of farming which can be classified as extensive require large amounts of capital. For example, where cash crops and cattle feeding are major enterprises, large amounts of capital are used. More intensive farms, such as those with dairy cattle, tend to have smaller investments in farm capital.

Cash receipts and expenses, changes in farm capital managed, and other items are shown in table 3. In order to make all farms comparable, receipts and expenses of landlords are included. "Labor earnings" is the amount that would be left as a salary to the farm operator for his labor and management if he paid wages equivalent to that of a hired man for the labor of other members of the family, and a charge of six percent interest on farm capital managed was included as part of the farm expenses. There is considerable variation in earnings between types of farming. Labor earnings varied from \$5703 for farms with a complete hog program for their only enterprise to a high of \$17081 for dairy farms with over 55 cows. It is important to bear in mind that the relative profitableness of various enterprises will vary from year to year. For example, in 1969, farms specializing in hogs and feeder cattle produced the greatest return

to labor and management. There is also a wide variation in earnings within a particular farm type. Thus, one cannot assume that the type of farm which ranked first in profitability in 1970 will be the most profitable in succeeding years, nor that having a particular type of farm assures one of high earnings even in years when that particular type of farm is most profitable. These data should be studied in the light of current prices, yields, and similar information.

Since capital purchases, such as machinery, equipment and buildings, are used for more than one year, only the annual depreciation enters into the calculation of labor earnings by showing increases in capital as a receipt and decreases as an expense. Increases or decreases are the differences in the average farm capital between January 1, 1970 and December 31, 1970, as shown in table 2. This summarizes in one figure the net effect of the following changes:

<sup>\*</sup> Total purchases and sales are shown in table 3.

Approximately 45 to 75 percent of each dollar of sales is required to pay cash operating costs (table 4). Another 10 to 25 percent of each dollar of sales is required for capital expenditures. The latter includes the purchase of power, machinery, livestock equipment, and real estate improvements. Thus, 65 to 85 percent of each dollar of receipts is required to pay for farm purchases, leaving the balance for family living expenses, interest on money borrowed, debt retirement, and other savings. Farms with feeder livestock (finishing hogs or feeder cattle) spent a large portion of their income on livestock purchases and feed. The portion spent for feed was generally lower on farms where cash crops were an important source of income.

The data in table 5 show earnings on an enterprise basis. Instead of emphasizing purchases and sales, the enterprise basis stresses net value produced and net expenses. On the enterprise basis, value of livestock and livestock products produced includes sales, value used in the home, changes in inventories, and accounts for transfers between enterprises. Purchases of livestock are subtracted so the data represents

value of livestock and livestock products added by the enterprise.

In the calculation of the return from crops, credit is given to crops for feed raised on the farm and consumed by livestock. The return to crops, as shown in table 5, becomes the net value of crops produced that year less the cost of seed, fertilizers and other miscellaneous cash expenses for crop production.

Costs of operating each service enterprise (truck and auto, tractors and crop machinery, etc.) are calculated in a similar manner. Expenses and net decreases includes depreciation as well as repairs, gas, oil, etc. Thus, while earnings statements on an enterprise basis do not show purchases and sales, such a statement more truly reflects value produced for the productive enterprises and the net expenses for each of the service enterprises.

Crops are a major source of income on all farms when credit is given to crops for feed raised on the farm and consumed by livestock (table 6). In nine of the fourteen types of farms shown in table 5, crops contribute more to income than the return over feed from livestock. The proportion of farm income from livestock, crops and miscellaneous sources is based on receipts and net increases, as shown in table 6.

<sup>1.</sup> For the method of calculation of income and expenses on an enterprise basis, see Nodland, Truman R., "Know Your Farm Business," University of Minnesota Agricultural Extension Pamphlet 138, Revised 1971.

Return over feed is the amount of income added by livestock after feed costs are deducted. The return to crops represents the value of crops produced during the year after costs of seed, fertilizer and similar costs have been deducted. Miscellaneous income is from work off the farm, conservation payments, and other similar items of income. Relative prices of crops and livestock have an important effect on the proportion of income contributed by the cropping and livestock program. In 1969, for example, only seven of the types of farms illustrated added more to income from crops than from livestock.

### Land Use and Crop Yields

Farms on which dairy cattle are the only major livestock enterprise have a relatively large proportion of their land in pasture and hay and less in grain crops (including corn) than other types of farming (table 7). Specialized dairy farms have about 70 percent tillable land; all other types of farms have over 80 percent tillable land. Farms with characteristics of small size and a lower percent of tillable land illustrate the tendency of farms to be organized to enable the operator to maximize the return to the most scarce resource. These farms have dairy cattle, which require larger amounts of labor but return more per acre than many other kinds of livestock.

On farms without dairy cattle, most of the tillable land was in feed grains, corn, soybeans, or the feed grain program. On dairy farms, approximately 35-40 percent of the tillable land was used for growing alfalfa hay or tillable pasture. Except for differences in the amount of land devoted to hay and pasture, there were no major differences in the cropping programs of the different types of farms with livestock enterprises. Special crops, such as canning corn and canning peas, were raised on all types of farms except some dairy farms and complete hog farms. Cash crop farms reported more acres of these crops than other farm types.

Crop yields, as reported in table 8, do not appear to be related to the type of farm, although yields on the smallest dairy farm type were generally lower in all crops. For example, yields of alfalfa hay are not significantly different among the types of farms, even though some types are highly dependent upon the crop as a source

of feed. There was considerable variation, however, in the reported yields of a number of crops. Corn varied from 109 bushels per acre on the feeder cattle and cash crop farms to a low of 82.4 bushels on the hogs and feeder cattle farms. Feed grain payments per acre were similar among farm types.

### Livestock Enterprises

Feed costs, returns, and some related factors are shown for dairy cattle, hogs, and feeder cattle in tables 9 to 13. Home grown feeds have been charged to livestock at current market prices during the year. Purchased feeds were charged at cost. The number of head of livestock represents the average number on hand at the beginning of each month.

The return above feed cost per dairy cow varied from \$325 on the dairy and cash crop farms and small dairy farms to \$475 on the dairy specialty farms with 35-44 cows. Variations in milk production and feed cost are relatively small.

Specialized hog farms raised two to three times more litters than the farms that kept hogs along with one or more other enterprises. There is little evidence that

the enterprises on highly specialized farms are more efficient than "several enterprise" farms. Except for the finishing hog-cash crop farms, all swine were from complete (farrowing to market) programs.

While cattle feeders received about the same prices for fed cattle in 1970 as they did in 1969, their return over feed cost was only about half that received in 1969. Prices paid for feeders were slightly higher but feed costs were about the same.

As an average, dairy cattle give a higher return for each \$100 of feed consumed than is true for beef cattle or hogs. Since labor, buildings and equipment costs are generally less for beef cattle and hogs than for dairy, a lower return for each \$100 of feed consumed is needed in order to cover all costs of production.

### Factors Affecting Choice of Type of Farming

The records included in this report are for only one calendar year. Examination of the 1969 report reveals considerable variation between the two reporting years. These variations, in the main, are caused by differences in climatic conditions and general price levels—factors which the farmer cannot control. Furthermore, price levels do not rise or fall in unison. Some prices may rise while others are falling, or some may change faster than others. For these reasons, the relative earnings levels of the various types of farms may change from year to year.

A summary of some of the resources available, size of business, and other factors by type of farming is presented in table 14. Farms which have cash crops or feeder cattle as major enterprises generally use large amounts of capital and involve large acreages. These are more extensive enterprises and are best suited where labor is scarce as compared to land and capital. Dairying tends to be located on relatively small farms, where there is non-tillable land and where it is desirable—because of erosion and other factors—to include a considerable amount of hay and pasture in the rotation. Dairying is an intensive enterprise and is adapted to situations where labor is plentiful in comparison to land. Hogs seems to be adapted to a variety of situations.

A measure of return on capital managed is also reported in table 14. The rate of earnings varies from 4.9 percent on specialized hog farms to 12.2 percent on the largest dairy farms. This measure assumes a charge of \$7000 for the operator's labor.

Farms with dairy alone or in combination with other enterprises had less capital invested per man than did farms with cash crops or feeder animals as major enterprises. However, the total capital managed per farm was relatively high on large dairy farms.

<sup>1.</sup> Nodland, Truman R. and Edgar Persons, "1969 Farm Business Summary by Type of Farming for Southern Minnesota," Department of Agricultural and Applied Economics Report No. R70-6, August 1970.

There was not a wide variation in the amount of labor utilized among the types of farms. Only one farm type used 1.3 - 1.4 years of man labor; nine used 1.5 - 1.7 years, and four had 1.8 - 2.2 workers. Large dairy farms used the most labor with 2.2 workers reported. Their total work units with 797 was much larger than that reported by any other group. When viewed on a per man basis, farms with 1.5 - 1.7 workers had 189-364 work units per worker; with 1.8 - 2.2 workers, 199-362 work units were reported. The large dairy farms with 2.2 workers reported 362 work units per worker. If one could assume that farmers were all fully employed, the increased work units per worker may be an illustration of economies of size in the efficient use of labor.

Cash crop farms had relatively few work units in total and per worker. The length of the growing season prevents the accumulation of a large number of work units per worker. Labor is utilized in the off season by employment off the farm. Cash crop farms reported over \$2190 income from work off the farm.

The type of farming which a farmer selects is the result of factors such as the number of acres of tillable land and non-tillable land, topography, soils, climate, markets, availability of labor and capital, relative prices of agricultural products, and personal preference. Most farmers face some limitations in adopting a particular farming type since each farm needs to be organized so as to make the best possible use of the particular bundle of resources available on that farm. In general, in order to maximize income, farmers should attempt to maximize the returns from their most scarce resources. If the supply of labor is short, enterprises should be selected that best fit that amount of labor. Others may have limitations in respect to land or capital, which in turn affect the selection of enterprises. What to produce and how much to produce depends

can make a choice. The specific combination that he chooses should be dependent on the resources available and be consistent with the personal goals of the farm operator and his family.
