## California Department of Food and Agriculture

## Agricultural Commissioners' Crop Reports

 San Bernardino County
## 1968-1972

California County Agricultural Commissioners' Reports from the California Department of Food and Agriculture. This collection consists of annual crop and livestock data from each of the 58 California Counties. The collection covers 1915-1981; digitization of the rest of the collection is forthcoming.

This digitization project was funded by the Giannini Foundation of Agricultural Economics, http://giannini.ucop.edu/.

The work was completed by the staff of the Giannini Foundation Library, University of California, Berkeley, http://are.berkeley.edu/library/ . Please contact the Library to consult the originals.

Donald C. Beckord
William A. Betterly
In compliance with the provisions of Section 2279 of the Agricultural Code of the State of California, I hereby submit the Annual. Crop and Livestock Repor for the year 1968 covering the conditions, acreage, production and value of the agricultural products for the County of San Bernardino.

The values in this report represent the gross value of commercial agricultural production in San Bernardino County. On this basis the total value of farm products produced in the county amounted to $\$ 130,998,660$ for 1968 as compared with a revised figure of $\$ 134,239,000$ for 1967.

This value is a two and one-half perccnt decrease from the previous year and is the fourth highest value on record for the county. The gross value of crops was $\$ 28,221,460$ as compared with $\$ 36,477,000$ for 1967 , with 750 less acres in production. The estimated value of livestock production and products was $\$ 102,777,200$, an increase of $\$ 5,000,000$ over the previous year. There were fifteen agricultural commodities in the county with a valuation of more than one million dollars.

Adverse weather conditions contributed heavily to reduced crop production for the year. There were periods of rainy cool weather that interfered with normal blooming and crop setting. There was a severe freeze in December, 1967, that further reduced an already poor 1968 citrus crop. Unseasonable hot spells plus prolonged periods of low humidity also tended to reduce production. Other problems encountered during the year were continued low prices for certain products, especially eggs, plus an unstable labor supply. Associated with these problems is that farm production costs continued to climb while prices remained about the same. Net income thus showed little improvement due to this financial squeeze. The gross values mentioned above do, however, have an important imnact on the county's economy when related processing and marketing activities are considered.

To the members of our department and others who cooperated with us in providing pertinent information to make this report possible, we extend our sincere appreciation.

## CROP AND LIVESTOCK ANALYSIS

Valuations given in this report for packed citrus are f.o.b. as fruit leaves the packing house. The season average price and value of other fresh market fruits are on the basis of equivalent returns at first delivery point or at roadside. Processed fruit price and value are on the basis of equivalent returns at processing plant door. Vegetable average price and value are on a packed and loaded basis f.o.b. shipping point. Values for feed lot cattle are figured on a weight gain basis while the remainder sold from the range, cull dairy stock and calves as well as other livestock are figured on the basis of full weight. Milk production and valuation figures were supplied by Crop Reporting Service and are for comuercial milk only. Erg prices are based on the overall average received by the producers with allowances being made for those sold direct to consumers.

Citrus: The total citrus acreage for San Bernardino County for 1968 was 22,397 acres. This is a net reduction of only 285 acres of citrus from the previous year's records. The county thus remains one of the leading citrus counties in the State. Total citrus froduction was $4,448,100$ cartons, including fruit sold for processing. This figure is only 42 percent of the previous year's production and is the lowest in the last decade. The navel orange crop was the poorest in volume in many years with a county average of only 125 field boxes per acre. Valencia oranges fared even worse as the average was a meager 81 boxes per acre. Reasons advanced for this low production. year for oranges can be blamed on the elements. A cool rainy period interrupted the normal bloom in the spring of 1967. This was followed by a sudden hot spell causing excessive drop of newly set fruit. In December, 1967, a severe freeze period in the east end districts further reduced marketable fruit. The lemon crop was the lightest in several seasons with only fair quality. A fair crop of grapefruit was harvested that was plagued by rind staining and wind scars. Price returns for all citrus was generally good. Total valuation of all citrus was $\$ 13,749,600$, a reduction of 36 percent from the previous citrus season.

Deciduous Fruits: The cherry, grape and plum crops were not immune from unfavorable weather as an April cold spell reduced the potential of these crops in localized areas. The total grape tonnage was the lowest in several decades. On the other hand, apple and strawberry production was well above average.

Vegetable and Field Crops: Reductions in potato, sweet corn and tomato acreage are responsible for a 200 acre reduction in vegetables. Values per unit are up slightly in most cases. Field crop acreage was down 1,000 acres attributed mainly to reduced plantings of grain hay, field corn, barley and sudan grass. Values on most all items were down from the previous year.

Livestock: The estimated value of all livestock and poulcry production was $\$ 102,777,200$, an increase of $\$ 5,000,000$ over the previous year. This increase can be attributed to increased milk production, a good cattle market and a slighi improvement in egg prices, especially the latter part of the year. Total egg production was $118,000,000$ dozen, a figure that ranks high in the state on a county basis. Turkey production declined slightly as did hogs and sheep. Milk production for the year is valued at $\$ 51,072,000$, an increase of $\$ 3,170,600$ over the previous year's revised figure. There were 308 dairies in the county at the end of the year, of these 277 are located in the west end of the county. There are presently five additional dairies under construction. A preliminary production figure of $9,305,600$ hundred weight of milk for the year thus retains San Bernardino County as first in milk production in the state.

Report and Analysis Compiled by:
Warren A. Burr
Department Statistician

In compliance with the provisions of Section 2279 of the Agricultural Code of the State of California, I hereby submit the Annual Crop and Livestock Report for the year 1969 , covering the conditions, acreage, production and value of the agriculsural products for the County of San Bernardino.

The values in this report represent the gross value of commercial agricultural production in San Bernardino County. On this basis the total value of farm products produced in the county amounted to $\$ 145,767,500$ for 1969 as compared with a revised figure of $\$ 131,359,160$ for 1968.
This value is an eleven percent increase over the previous year and is the highest value on record for the county. The gross value of crops was $\$ 26,793,500$ as compared with $\$ 28,221,460$ for 1968 , with 6,900 less acres in production, The estimated value of livestock production and products was $\$ 118,974,000$, an increase of $\$ 15,836,000$ over the previous year. There were fifteen agricultural commodities in the county with a valuation of more than one million dollars.

Growers were again plagued by adverse weather conditions early in the year that tended to reduce crop production and grade with a corresponding reduction in gross returns. A severe freeze in December, 1968, reduced a promising new citrus crop. This freeze period was followed by record rainfall totals in January and February which caused additional defects to citrus fruit and flood damage to other crops.

Much of the increase in this record valuation can be attributed to increased producetion of dairy livestock and products coupled with higher receipts for milk and eggs. With few exceptions, returns to the grower remained about the same while farm production costs continued to climb. Thus net income showed little or no improvement due to this financial squeeze. The gross values mentioned do, however, have an important impact on the county's economy when related processing and marketing activeities are considered.

To the members of our department and others who cooperated with us in providing pertinent information to make this report possible, we extend our sincere appreciation.

Respectfully submitted,
R.M. fathrieiden

Agricultural Commissioner

## CROP AND LIVESTOCK ANALYSIS

Valuations given in this report for packed citrus are f.o.b" as fruit leaves the packing house. The season average price and value of other fresh market fruits are on the basis of equivalent returns at first delivery point or at roadside. Processed fruit price and value are on the basis of equivalent returns at processing plant door. Vegetable average price and value are on a packed and loaded basis f.o.b. shipping point. Values for feed lot cattle are figured on a weight gain basis while the remainder sold from the range, cull dairy stock and calves as well as other livestock are figured on the basis of full weight. Milk production and valuation figures were supplied by the Crop Reporting Service and are for commercial milk sales only. Egg prices are based on the overall average received by the producers with allowances being made for eggs sold direct to consumers.

Citrus: The total citrus acreage for San Bernardino County at the end of the year was 20,300 acres. This is a net reduction of 1,536 acres from the previous year's records. Removal of all orange varieties totaled 860 acres, lemons 608 acres and grapefruit 68 acres. Total citrus production was only $6,759,000$ cartons, including fruit sold for processing. Reasons advanced for this low production year plus the removals mentioned above can be blamed on the elements. Early forecasts and prospects seemed good for all citrus varieties until December 20 and 21 , 1968, when a sudden cold spell was experienced in all districts. Temperatures dropped as low as 19 degrees in some districts and were in the low twenties for several hours. Losses ran into millions of dollars with the highest amount occurring to the lemon crop in Upland and Alta Loma where 90 percent of the crop was destroyed. Fecord rainfall in January and February added to the loss figure through water rot, soil erosion and mud buildup. Price returns for citrus was generally poor due to the high percentage of fruit that was diverted to processing. This is reflected in the total valuation figure of only $\$ 9,638,000$ for all citrus production.

Deciduous Fruits: Reduced acreage is noted for most deciduous crops while production figures show a return to normal, especially apricots, wine grapes and plums. Price returns were generally good, with the exception of apricots.

Vegetable and Field Crops: Reductions in onion, potato and sweet potato acreage are responsible for a 300 acre reduction in vegetables. Values per unit are up slightly in most cases. Field crop acreage was down 770 acres attributed mainly to reduced plantings of barley, dry beans, alfalfa, hay grain and sugar beets. Values on major items increased over the previous year.

Livestock: The estimated value of livestock and poultry production was $\$ 118,974,000$, an increase of $\$ 15,836,000$ over the previous year. This increase can be attributed mainly to increased milk production, improvement in egg prices, a good cattle market and an upswing in turkey production. Total commercial milk production was an estimated $119,500,000$ gallons with returns over $\$ 57,000,000$. The total value of the dairy industry, including cattle and calves sold was close to $\$ 65,000,000$ from the 316 dairies presently in the county. Of this total, 291 dairies are located in the Chino-Ontario area. Based on the above figures, San Bernardino is now the leading county in milk production not only in the state but the nation as well. A 6 cent per dozen increase in egg prices was also instrumental in achieving this high live-stock-poultry valuation. The total value of the poultry industry was an estimated $\$ 49,000,000$, a figure that ranks high in the state on a county basis.

Deputies

Jerry Fielder, Director
California Department of Agriculture
Honorable Board of Supervisors
Ruben Ayala, Chairman
Donald C. Beckord
William A. Betterly
Daniel D. Mikesell
Nancy E. Smith
In compliance with the provisions of Section 2279 of the Agricultural Code of the State of Califormia, I hereby submit the Annual Crop and Livestock Report for the year $1^{\prime}, 70$, covering the conditions, acreage, production and value of the agricultuial products for the County of San Bernardino.

The values in this report represent the gross value of commercial agricultural production in San Bernardino County. On this basis the total value of farm products produced in the county amor-med to $\$ 167,079,200$ for 1970 , as compared with a revised figure of $\$ 147,003,900$ for 1969.

This value is a thirteen percent increase over the previous year and is the highest val:s on record for the county. The gross value of crops was $\$ 25,014,200$, as compared with $\$ 26,793,500$ for 1969 , with 1,293 less acres in production. The estimated value of livestock production and products was $\$ 142,065,000$, an increase of $\$ 21,854,600$ over the previous year. Most of the increase in this record valuation can be attributed to increased production of dairy livestock and products coupled with higher receipts for milk and increased egg production. There were fifteen agricultural commodities in the county with a valuation of more than one million dollars.

Growers were again plagued by adverse weather conditions the first part of the year that tended to reduce crop production and grade with a corresponding reduction in gross returns. A freeze periou in late December 1969, followed by periods of strong winds, reduced a promising cilrus crop. Another cold spell in April doomed a good grape crop. Hot, dry winds in May caused unseasonable drop of the new citrus c!op. Rainfall totals for the season was only 9.5 inches, far below normal.

Although 1970 was a record year in gross income, mounting production costs will again result in a decline in net farm income. Higher wage rates, taxes and interest costs continues to place many of our producers in a critical financial squeeze. This gross value figure does, however, have an important impact on the county's economy when related processing and marketing activities are considered.

To the members of our department and others who cooperated with us in providing pertinent information to make this report possible, we extend our sincere appreciation.

Respectfully submitted,

Agricultural Commissioner

Valuations given in this report for packed citrus are fob. as fruit leaves the packing house. The season average price and value of other fresh market fruits are on the basis of equivalent returns at first delivery point or at roadside. Processed fruit prise and value are on the basis of equivalent returns at processing plant door. Vegetable average price and value are on a packed and loaded basis f.o.b. shipping point. Values for feed lot cattle are figured on a weight gain basis while the remainder sold from the range, cull dairy stock and calves as well as other livestock are figured on the basis of full weight. Milk production and valuation figures were supplied by the Crop Reporting Service and are for commercial milk sales only. Egg prices are based on the overall average received by the producers with allowances being made for eggs sold direct to consumers.

Citrus: The total citrus acreage for San Bernardine County at the end of the year was 19,587 acres. This is a net reduction of 713 acres from the previous year's records. Total citrus production was only $5,396,000$ cartons, including fruit sold for processing. Reasons advanced for this low production year, aside from the removals mentioned above, can be blamed on another frost year, windy weather and a short volume Valencia orange crop. Price returns for citrus showed very little improvement over last season. This is reflected in the total valuation figure of only $\$ 10,120,000$ for all citrus production.

Deciduous Fruits: Reduced acreage is again noted for wine grapes with over 800 acres removed from production. Below freezing temperatures occurred on five separate dates during the month of April inflicting major damage to the wine grape crop and causing a reduction in yield of other deciduous fruit crops. Damage to the grape crop was responsible for one of the lowest yields on record. Total production averaged slightly less than one ton per acre. All grape growing areas of the county were declared a "disaster area" by the Board of Supervisors.

Vegetable and Field Crops: Reduced acreage of cabbage, potatoes, sweet corn and sweet potatoes is mainly responsible for a 600 acre reduction in all vegetables. Values per unit were up slightly in most cases. Field crop acreage was down 300 acres. Alfalfa continues to lead this category with 19,000 acres, of which 14,800 are produce in the Mojave Valley. Total valuation of all baled and "green chop" alfalfa was over 3.5 million dollars.

Livestock and Products: The estimated value of livestock and poultry production was $\$ 142,065,000$, an increase of $\$ 21,800,000$ over the previous year. This increase can be attributed mainly to increased milk production, dairy cattle, hogs, chicken fryers, baby chicks and eggs. Total commercial milk production was an estimated 159,300,000 gallons with returns over $\$ 77,697,000$. The total value of the dairy industry, including cattle and calves sold was $\$ 86,646,000$ from the 327 dairies presently in the county. Of this total, 300 dairies are located in the Chino-Ontario area, an increase of 11 over the previous year. Based on the above figures, San Bernardine is the leading county in milk production in the states as well as the nation. An increase in the number of laying hens partially offset a decrease in egg prices and was also instrumental in achieving this high livestock-poultry valuation. The total value of the poultry industry was an estimated $\$ 49,600,000$, a figure that ranks high in the state on a county basis.

Jerry Fielder, Director
California Department of Agriculture
Honorable Board of Supervisors
Ruben Ayala, Chairman
Donald C. Beckord
William A. Betterly
Daniel D. Mikesell
Nancy E. Smith
In compliance with the provisions of Section 2279 of the Agricultural Code of the State of California, I hereby submit the Annual Crop and Livestock Report for the year 1971, covering the conditions, acreage, production and value of the agricultural products for the County of San Bernardino.

The values in this report represent the gross value of commercial agricultural production in San Bernardino County. On this basis the total value of farm production in the county amounted to $\$ 179,029,900$ for 1971 , as compared with a revised figure of $\$ 166,207,300$ for 1970 .

This value is seven and one-half percent increase over the previous year and is the highest value on record for the county. The gross value of crops was $\$ 32,429,900$, as compared with $\$ 25,014,200$ for 1970 , with 4,924 less acres in production. The estimated value of livestock production and products was $\$ 146,600,000$ an increase of $\$ 5,406,900$ over the previous year. Most of the increase in this record valuation can be attributed to increased production of dairy products and increased production and returns for citrus and grapes. There were 14 agricultural commodities in the county with a valuation of more than one million dollars.

Growers were again plagued by adverse weather conditions that tended to reduce crop production. In early January a cold spell was experienced throughout the valley with temperatures in the low twenties in the east end. Some damage was inflicted to the citrus crops but sporadic winds during this period prevented a major freeze. Above normal temperatures in February caused premature blooming of deciduous trees that were damaged by another cold spell in March and April. Temperatures in September and October set records with readings above 100 degrees for a number of consecutive days. Rainfall for the year was well below normal.

Although 1971 was a record year in gross value, production costs of many crops continued to rise and will largely offset this increase as little improvement is noted in net farm income. These mounting costs as well as higher wage rates, taxes and interest costs place many of our producers in a critical financial squeeze. This gross figure does, however, have an imporcant impact on the county's economy when related processing and marketing activities are considered.

To the members of our department and others who cooperated with us in providing pertinent information to make this report possible, we extend our sincere appreciation.

Respectfully submitted,

R. M. Schneider

Agricultural Commissioner

Valuations given in this report for packed citrus are fob. as fruit leaves the packing house. The season average price and value of other fresh market fruits are on the basis of equivalent returns at first delivery point or at roadside. Processed fruit price and value are on the basis of equivalent returns at processing plant door. Vegetable average price and value are on a packed and loaded basis f.o.b. shipping point. Values for feed lot cattle are figured on a weight gain basis while the remainder sold from the range, cull dairy stock and calves as well as other livestock are figured on the basis of full weight. Milk production and valuation figures were supplied by the Croce Reporting Service and are for commercial milk sales only. Egg prices are based on the overall average received by the producers with allowances being made for eggs sold direct to consumers.

Citrus: The total citrus acreage for San Bernardino County at the end of the year was 18,713 acres. This is a net reduction of 874 acres from the previous year. Total citrus production was $6,083,100$ cartons, including fruit sold for processing, an increase of some 700,000 cartons over the low production year of 1970 . The main contributor to this increase was lemons followed by Valencia and navel oranges. Price returns for all citrus show an increase of $\$ 5,000,000$ over last season which is reflected in the total valuation figure of $\$ 15,381,100$.

Deciduous Fruits: Reduced acreage is again noted for wine grapes with over 400 acres removed from production. A late cold spell in April did little damage to the grape crop as production returned to near normal with 3.5 tons per acre. Prices were also very good as returns to grower were up considerably over the previous season. The April cold weather did, however, tend to reduce the apple crop in Oak Glen. The status of apricots, peaches and plums remained about the same although a slight reduction in acreage is noted.

Vegetable and Field Crops: Reduced acreage for potatoes and sweet corn is mainly responsible for a 520 acre reduction in all vegetables. Field crop acreage was down 3,294 acres, attributed mainly to a reduction in alfalfa, sudan and grain crops. Housing developments along the Mojave River ware the main contributors to this reduced figure.

Livestock and Products: The estimated value of livestock and poultry production was $\$ 146,600,000$, an increase of 5.4 million dollars over the previous year. This increase can be attributed mainly to increased milk production, dairy cattle, chicken fryers and pullets. Total commercial milk production was an estimated 178,000,000 gallons with returns over $\$ 89,000,000$. The total value of the dairy industry, including cattle and calves sold, was $\$ 98,870,000$ from the 325 dairies presently in the county. Of this total, 304 dairies are located in the Chino-Ontario area, one of the largest concentrations in the world. Based on the above figures San Bernardino is the leading county in milk production in the state, as well as the nation. A slight increase in the number of laying hens is noted. Egg values dropped 9.6 million dollars from the previous year due to a 9 cent per dozen decrease in egg prices. The total value of the poultry industry was $\$ 41,787,000$, a decrease of 7.8 million dollars from the previous year. This reduced value figure does, however, rank high in the state on a county basis.

1972

Roy F. Camblin
Commissioner
.
C. B. Christensen, Director

California Department of
Food and Agriculture
Honorable Board of Supervisors
San Bernardino County

In compliance with the provisions of Section 2279 of the Agricultural Code of the State of California, I hereby submit the Annual Crop and Livestock Report for the year 1972, covering the conditions, acreage, production and value of the agricultural products for the County of San Bernardino.

The values in this report represent the gross value of commercial agricultural production in San Bernardino County. On this basis the total value of farm production in the county amounted to $\$ 193,473,600$ for 1972 , as compared with a revised figure of $\$ 178,031,200$ for 1971.

This value is an eight and one-half percent increase over the previous year and is the highest value on record for the county. The gross value of crops was $\$ 35,390,600$ as compared with $\$ 32,500,000$ for 1971. The estimated value of livestock production and products was $\$ 158,083,000$, an increase of $\$ 12,481,000$ over the previous year. This record valuation can be attributed mainly to increased production and returns for wine grapes, lemons, alfalfa and dairy products. There were fourteen agricultural commodities in the county with a valuation in excess of one milion dollars.

Growers were again plagued by adverse weather conditions that tended to reduce crop production and marketability. In January a cold spell was experienced throughout the valley with temperatures in the low twenties. Some damage was inflicted to the citrus crops from the cold as well as scarring of fruit that resulted from strong windy periods early in the year. Another cold period prevailed in March and April that affected early blooming deciduous fruit crops. Total rainfall for the season, that ended in July, was a little over nine inches, some eight inches below normal. Temperature readings were generally normal except for the cold spells indicated above and several days of extremely hot periods in mid-summer.

Although 1972 was a record year in gross value, production costs of many crops continued to rise and will largely offset this increase as little improvement is expected in net farm income. These mounting costs coupled with higher wage rates, interest costs and taxes continue to place many of our producers in a critical financial squeeze. Agriculture does, however, continue to make a major contribution to the county's economy.

To the members of our department and others who contributed valuable information to make this report possible, we extend our sincere appreciation.

Agricultural Commissioner

## CROP AND LIVESTOCK ANALYSIS

Valuations given in this report for packed citrus are fob. as fruit leaves the packing house. The season average price and value of other fresh market fruits are on the basis of equivalent returns at first delivery point or at roadside. Processed fruit price and value are on the basis of equivalent returns at processing plant door. Vegetable average price and value are on a packed and loaded basis f.o.b. shipping point. Values for feed lot cattle are figured on a weight gain basis while the remainder sold from the range, cull dairy stock and calves as well as other livestock are figured on the basis of full weight. Milk production and valuation figures were supplied by the Crop Reporting Service and are for commercial milk sales only. Egg prices are based on the overall average received by the producers with allowances being made for eggs sold direct to consumers.
Citrus: The total citrus acreage for San Bernardino County at the end of the year was 17,855 acres. This is a net reduction of 858 acres from the previous year. Total citrus production was $5,398,700$ cartons, including fruit sold for processing, a decrease of 684,400 cartons from the previous season. This decrease resulted from a reduced navel and Valencia orange crop. Price returns for all citrus was $\$ 13,610,200$, a decrease of $\$ 1,770,900$ from the 1971 valuation figure.
Deciduous Fruits: A late season cold spell in March and April did little damage to the grape crop as production remained near normal with 3.6 tons per acre. Returns to the producers were excellent as shown by an increase of over 2.3 million dollars over the previous year's crop value. The April cold spell did, however, tend to reduce the apple crop in Oak Glen. The status of apricots, peaches, plums and walnuts remained about the same.
Vegetable and Field Crops: A small reduction in vegetable acreage is noted although returns were up slightly. Alfalfa acreage was reduced some 700 acres while blackeye beans, cotton, pasture and field corn show an increase. Total valuation for field crops was up $\$ 864,000$ and was due mainly to increased returns for alfalfa hay.
Livestock: The estimated value of all livestock and poultry production was $\$ 158,083,000$, an increase of $\$ 12,481,700$ over the previous year. This can be attributed to increased milk production and dairy cattle plus higher returns for eggs. Total commercial milk production was an estimated $192,000,000$ gallons with returns of over $\$ 97,000,000$. The total value of the dairy industry, including cattle and calves sold, was $\$ 108,803,000$. There are 326 dairies in the county. Of this total, 305 dairies are located in the Chino area, one of the largest concentrations in the world. Based on the above figures San Bernardino is the leading county in milk production in the nation. A decrease in the number of laying hens is due to the Newcastle disease eradication program wherein $3,336,000$ birds were destroyed during the year. Inventory figures at the end of the year showed a decrease of $1,400,000$ layers from the $6,500,000$ average of the past few years. Increased egg prices are reflected in the 2 million dollar increase in the valuation which ranks high in the state on a county basis.
